The Right Hon. Sir R. B. Finlay, K.C., G.C.M.G.

Sir Thomas Glen-Coats, Bart., M.P.

Sir J. L. Mackay, G.C.M.G.

Sir George Sydenham Clarke, G.C.M.G.

Sir George H. Murray, K.C.B.

Captain Sir Charles L. Ottley, R.N., K.C.M.G., M.V.O.

Mr. H. Llewellyn Smith, C.B.

Mr. Edward Beauchamp, M.P.

Mr. Henry Neville Gladstone.

Mr. Frederick Huth Jackson.

Mr. Arthur Lindley.

Mr. George H. Duckworth (*Secretary*).

REPORT BY THE TREASURY COMMITTEE ON A NATIONAL GUARANTEE FOR THE WAR RISKS OF SHIPPING TO THE LORDS COMMISSIONERS OF HIS MAJESTY'S TREASURY.

MAY IT PLEASE YOUR LORDSHIPS,—

We are now in a position to present our Report on the matters submitted to us for enquiry.

1. The Reference to us was in the following terms:—

To consider and report—

(A) Whether it is desirable that the State should undertake to make good to shipowners and traders losses incurred through the capture of shipping by the enemy in time of war.

(B) If so, whether such indemnity should be granted gratuitously or should be coupled with the payment of premiums calculated to recoup the State—either wholly or in part—for the cost to be incurred.

(C) What conditions should be attached to the grant of the indemnity, and what arrangements should be made for the proper working of the scheme.

2. At our first meeting we considered these instructions with care, and remembering that the appointment of a Committee was in the first instance suggested by the Royal Commission on the Supply of Food and Raw Material in time of War, we decided to acquaint ourselves with the evidence heard before that Commission in so far as it was pertinent to our enquiry.

3. The special recommendation of the Royal Commission referred to above was contained in paragraphs 266-269 of the Commission's Report, where, after expressing the opinion that "a system of National Indemnity against loss from capture by the enemy would operate both as an additional security to the maintenance of our oversea trade and as an important steadying influence upon prices," the Commissioners placed on record their belief that "the advantages to be gained from some well-considered scheme of the kind seem to us very largely to outweigh any objections which have been stated to us." The Commissioners added that, while they did not consider themselves competent to draw out the precise terms of such a scheme, they were "of opinion that a small expert Committee should be appointed to investigate the subject and frame a scheme after consultation with underwriters and others interested in our mercantile marine." Royal Commission on Food Supplies. Report, par. 268

4. With the Evidence and Report of the Royal Commission before us, we felt that our investigations should start from the point at which the inquiries of the Commission ended, but that whilst the principal subject of the Commission's deliberations had been the maintenance of the supply of food and raw materials, our inquiries must embrace an allied but rather different aspect of the question, viz., the maintenance of the activities of the mercantile marine in time of war. In order still further to break new ground, whilst at the same time concentrating attention on the practical difficulties which would have to be faced in any scheme of the kind contemplated in our reference, we drew up skeleton schemes of National Indemnity and National Insurance to form a basis for the cross-examination of witnesses. Our special thanks are due to two of our members, Sir George Murray and Sir George Clarke, for the assistance which they afforded in suggesting the main lines on which these schemes were framed.

5. For the sake of convenience these draft schemes were named "A" and "B," draft "A" being a scheme of Gratuitous Indemnity, and draft "B" one of National Insurance (or, as it sometimes called, Purchased Indemnity) with premiums calculated to recoup the State in part at least for the cost to be incurred. They are frequently referred to as "A" or "B" without further explanation in the course of the evidence.

6. Our meetings before Christmas, 1906, were chiefly confined to the consideration and emendation of these drafts. Copies of each were printed after revision, and sent to intending witnesses in anticipation of their evidence, with a request that they would give their careful attention to the various conditions suggested in them, and a warning that these schemes were not to be considered as in any way prejudging the ultimate conclusions of the Committee.

7. We found that this plan of procedure was successful in stimulating criticism and was useful as a means of eliciting opinions without committing the Committee to any definite pronouncement in favour of either one or the other. These schemes will be found printed in full in the Appendix.

8. A third scheme, lettered C, was subsequently prepared by Captain Sir Charles Ottley, R.N., a member of the Committee, and is included in the Appendix, together with an explanatory Memorandum handed in by him.

9. With the special object of obtaining expert opinion, invitations were sent to members of Lloyd's and to representative bodies such as the Chamber of Shipping of the United Kingdom, the Liverpool Steamship Owners' Association, the Association of Chambers of Commerce of the United Kingdom, the United Kingdom Mutual Steamship Assurance Association, the North of England Protecting and Indemnity Association, the General Council of the Bar, the Law Society, and selected shipping and mercantile firms, asking them to submit evidence on the subjects referred to us for consideration.

10. A notice was also circulated through the Press inviting associations or individuals who had not been addressed directly to suggest witnesses and submit memoranda.

11. The answer of the legal bodies mentioned was to the effect that the questions referred to us lay beyond their province; while the Association of Chambers of Commerce replied that it was unable to take action in the absence of a special resolution from one of the Chambers composing the Association. We understand that since the close of our evidence a resolution has been passed by this Association at its recent autumnal meeting at Liverpool declaring "that it may be desirable for the nation to assume, by means of some suitable scheme, responsibility for losses at sea in time of war. . . ," but that pending our Report no further steps are to be taken to discuss the question. We gather that, at the meeting at which this resolution was passed, there was evidence of the existence of a strong body of opinion that, in the event of the adoption of a scheme, the direct benefit of a State Guarantee should not be confined to shipping interests only.

12. From the names submitted through these and other sources we selected representative witnesses who were able to speak with expert knowledge of the questions raised by the terms of our reference.

13. In all we have examined 29 witnesses, of whom eight were underwriters, viz. :—

Mr. Alfred Roberts.
Mr. R. B. Lemon.
Mr. Raymond Beck.
Mr. Sidney Boulton.
Mr. J. T. Binning.
Mr. Charles Wright.
Mr. Douglas Owen.
Mr. William Gow

Three were or had been in responsible positions under the Admiralty, viz. :—

Captain Harry Jones, R.N.
Admiral of the Fleet Sir Arthur Wilson, V.C., G.C.B., G.C.V.O.
Admiral Sir Cyprian Bridge, G.C.B.

Seven were Shipowners or Shipowners Representatives, viz. :—

Mr. F. Leverton Harris, M.P.
Sir Theodore Angier.
Mr. F. Bolton.
Mr. Charles Brightman.
Mr. Norman Hill.
Mr. J. P. Maclay.
Sir Thomas Sutherland, G.C.M.G.

Four were Bankers or Bill Brokers, viz. :—

Mr. Christopher Nugent.
Mr. Thomas Estall.
Mr. Toomey.
Mr. R. W. Jeans.

One was an Average Adjuster, viz. :—

Mr. Charles McArthur, M.P.

Two were representatives of Mutual Indemnity Associations, viz. :—

Mr. H. R. Miller.
Mr. J. Stanley Mitcalfe.

In addition we invited evidence from :—

The Right Hon. The Lord Balfour of Burleigh, K.T., Chairman of the Royal Commission on Food Supplies.
Mr. T. Gibson Bowles.
Sir Robert Giffen, K.C.B., F.R.S.
Mr. J. St. Loe Strachey.

14. Of the above Mr. Leverton Harris and Mr. Bolton are underwriters and brokers as well as shipowners, and Mr. Mitcalfe appeared also as a representative of the United Kingdom Chamber of Shipping.

15. A transcript of the evidence of Admiral of the Fleet Sir A. Wilson is forwarded herewith for the information of your Lordships, but, in deference to the opinion expressed by the Board of Admiralty that it is undesirable in the public interest to make it public, we refrain from printing it with the rest of the evidence.

16. The evidence of these witnesses when taken in conjunction with that tendered to the Royal Commission on Food Supplies,* forms a representative and weighty body of opinion. The diversity of views prevailing both as to the desirability and results of State action is remarkable, and bears testimony to the complexity of the subject which has been referred to us. It extends to almost every point of our enquiry, and, bearing in mind the special competence of the witnesses in the subjects on which they were examined, must be held to show how speculative are even the best considered opinions

* See the evidence of the following amongst others as recorded in the Report, Cd. No. 2644 (1905) :— Mr. Beauchamp, M.P., Underwriter; the Rt. Hon. Charles Booth, Shipowner; Admiral Sir Cyprian Bridge; Mr. C. H. Faber, Underwriter at Lloyd's; Sir John Glover, Shipowner; Mr. William Gow, Secretary, Union Marine Insurance Co., Liverpool; Mr. Leverton Harris, M.P., Shipowner and Insurance Broker; Mr. H. Haslam, Underwriter; Admiral Sir John Hopkins : the late Sir Henry Hozier, Secretary of Lloyd's; Captain E. F. Inglefield, R.N.; Sir Alfred Jones, Shipowner; Mr. R. T. Jones, Company Underwriter; Sir James Mackay, Director, British India Company; Mr. F. W. Marten, Underwriter at Lloyd's; Mr. J. Stanley Mitcalfe, North of England Indemnity Association; Mr. Douglas Owen, Secretary, Alliance Marine Assurance Co.; Mr. E. Pembroke, Shipowner; Mr. W. Runciman, M.P., Tramp Steamer Owner; Mr. H. Llewellyn Smith, C.B., Board of Trade; Mr. H. Sumner, Liverpool Underwriters' Association; Mr. H. Wilding, Shipowner.

as to the probable course of events in a great naval struggle. Nevertheless, we venture to hope that our labours have not been in vain, and that the difficulties and dangers as well as the advantages likely to follow from State action, together with our own conclusions on a review of the whole of the evidence, will be found to be clearly stated and sufficiently discussed in the paragraphs which follow.

17. We greatly regret that we have not had the advantage of discussing the terms of our Report with Sir George Clarke. He took an active interest in our proceedings, examined most of the witnesses, and heard the whole of the evidence, but his appointment as Governor of Bombay necessitated his departure from England before the Report was drafted. He left with us a Memorandum of his views, which is printed at the close of our Report, and to which we wish to draw special attention, though we are unable, for reasons which will be stated later, to recommend the adoption of his proposals.

18. For the purposes of our enquiry, we have assumed throughout: —

(a) That the British fleet would be strong enough to secure and thereafter to maintain command of the sea.

(b) That the laws of maritime warfare, including the laws regulating capture, contraband of war, the right of search, &c., would remain unchanged. Some of the witnesses evidently held strong views as to the necessity for a revision (whether in the direction of a reversal or an extension) of the principles of the Declaration of Paris. But this subject was outside the scope of our reference, and we do not feel justified in offering any opinion upon it.

II.

Considerations affecting the Desirability or otherwise of some form of National Guarantee.

Definition of Terms.

19. The words insurance and indemnity, with the qualifications "National" or "State" prefixed to them, were used interchangeably before us as they had been before the Royal Commission on Food Supplies. Some confusion followed on this practice, and we agree with Lord Balfour that it is better that a distinct meaning should be attached to each. Accordingly we have used the word "Insurance" to denote a guarantee by the State of the shipowner's or merchant's losses in return for payment by the shipowner or merchant of a premium calculated to protect the State wholly or partially against loss. Under the name of "Indemnity" we refer to a similar guarantee by the State given without exacting any contribution from the guaranteed. And we include all schemes under which the State would assume liability for war losses, whether free from all cost to the owners or in return for a contribution from them, under the common title of National or State Guarantee.

20. In practice there is no rigid distinction between insurance and indemnity, and they merge by almost insensible gradations into one another. Thus in cases where the premium charged is one that is not calculated to recoup the full cost to the Government, "insurance" becomes in part "indemnity," whilst on the other hand it is quite compatible with the general principles of a free indemnity that a small registration fee should be charged on the admission of any ship to its advantages.

The Object of a National Guarantee.

Balfour, q. 15.

21. As we have said, the question of insurance or indemnity came before the Royal Commission on Food Supplies in Time of War, primarily as a means of securing our oversea food supplies and avoiding excessive fluctuations in prices. But the maintenance of the activity of the mercantile marine was recognised as an ulterior

object, and in paragraph 229 of their Report the Commissioners stated that the object of a national guarantee would be "to minimise, so far as possible, or even to eliminate altogether, the amount by which war insurance would increase the cost of commodities, and to prevent British shipowners being compelled, owing to the disadvantageous position in which they might find themselves with reference to neutral competitors, either to lay up their ships or transfer them to a neutral flag."

22. These views were emphasised and developed by some of the witnesses who appeared before us. Thus Lord Balfour, Chairman of the Royal Commission, suggested that some scheme was desirable in order to overcome difficulties caused by the changed condition of naval warfare, since protection by convoy would probably be no longer practicable. Balfour, q. 7.

23. Mr. Leverton Harris expressed a fear lest the increased price of war insurance should interfere with the import of raw materials and the export of manufactured goods, and drew attention to the great social danger which would arise in the event of our supply of raw materials "either being cut off or raised to such a price that we as an industrial nation, would be unable to compete with rival manufacturers in other countries." Employment, he argued, was more important than food supply, "a man who is in employment can afford to pay a rise in the price of food—such a rise as was anticipated in the Report of the Food Supply Commissioners. . . But if you had several million working men and women in this country employed in the iron trade, employed in the cotton trade, and so on, thrown out of employment, then you would have a much graver national danger than the danger that would occur in consequence of an increase in the price of food." Harris, q. 498. Harris, q. 504.

24. Captain Jones urged that the greatest advantage of a guarantee would be to relieve the Admiralty from undue pressure from private interests, and to leave them free to pursue their strategic plans unhampered by a public demand for special protection for commerce whilst at the same time giving them a right to control the movements of the mercantile marine. Jones, q. 276. Jones, q. 281.

25. Mr. Nugent favoured the idea on the ground that it would facilitate the operations of bankers and discount houses, and would thus give confidence to shipowners and cargo-owners that their bills would be discounted. Nugent, q. 3563.

26. Mr. Boulton held that the effect of a State guarantee would be to steady prices, encourage shipping, and prevent panics. Boulton, q. 1543, 1591.

27. Mr. Norman Hill, of the Liverpool Steamship Owners' Association, declared that in the opinion of his Association, which represents nearly half the British liner tonnage, a scheme of indemnity was absolutely necessary if the oversea trade was to be carried on effectively in time of war. Hill, q. 3615. Hill, q. 3619–20.

28. Sir Cyprian Bridge thought that "previous to the actual commencement of the war naval defence of commerce cannot operate, at any rate directly. 'Shadowing' the future enemy's men-of-war before hostilities begin will do something, but probably not enough to keep down the rate of insurance. As soon as war has broken out, direct naval defence becomes permissible, but it is likely to operate with imperfect effect until the enemy has been obliged to show his hand. . . . . I can see that, in the period of uncertainty when the onslaughts and the acts of repelling them are only likely, some administrative measure may be indispensable. The object will be to encourage our merchant ships to continue running, and especially to get the food and raw material which we cannot do without, safe into our ports. Adoption of the arrangement known as the national guarantee may be the right measure. It is, as regards the period of uncertainty, a matter on which, in my belief, the opinion of a naval officer, as such, is of little importance." Bridge, q. 4795

29. The opinions just cited give what in the minds of many of the witnesses was not only the object, but would, in fact, be the effect of some form of National Guarantee for the war risks of shipping. The immediate objects of a guarantee, as stated by the advocates of a State scheme may therefore be summarised as follows:

(*a*) The maintenance of public confidence during war, and especially during the periods of uncertainty immediately preceding and succeeding the declaration of war.

(*b*) The encouragement to shipowners and cargo owners to continue their business during such periods.

(*c*) The liberation of the Admiralty from the pressure of an uninstructed public opinion adversely criticising their strategic dispositions on the ground of commercial losses and possibly affecting detrimentally the conduct of the war.

(*d*) The removal of any temptation to lay up British ships or to transfer British trade and shipping to a neutral flag.

(*e*) The elimination of the amount by which war insurance would at such a time increase the cost of commodities.

(*f*) The maintenance of the supremacy of the British Mercantile Marine in time of war.

(*g*) The maintenance of our oversea supplies of food and raw material without an excessive rise in price.

30. How far danger on these points really exists, and to what extent a National Guarantee may reasonably be expected to remove or diminish it in the face of the disturbed conditions obtaining in a time of war form the subject of discussion in the paragraphs which follow.

31. It will, however, be convenient to note here that the maintenance of our export trade is as important both to the industrial life of the community and to the profitable employment of the mercantile marine as is that of our import trade. Any arguments, therefore, which may be adduced in favour of a National Guarantee for the latter apply equally to the former. The two branches of trade cannot be separated for the purposes of our enquiry, and our conclusions must be held to refer to both.

Shipping in War Time.

Sutherland, q. 4259
Sutherland, p. 4260

32. Sir Thomas Sutherland said that the first effect of war would be to cause ships to be laid up. He further emphasised his point by adding that, if the danger of capture, imprisonment and loss of life were very serious neither shipowners nor seamen would care to tempt their fate even if there was a chance of recovering insurance.

Harris, q. 612–14
Mitcalfe, q. 4358
McArthur, q. 4567
Sutherland, q. 4271
Giffen, q. 2981
Binning, q. 1925

33. Others enforced this view and pointed out how great the difficulties had been with crews in the Japanese war. But it was recognised that the "laying up" would be for a time only, and that the rise in freights caused by any considerable withdrawal would work its own cure. And Sir Thomas Sutherland himself allowed that after the first "panic" was over, "if we had a chance of doing business there is no doubt business would be done." It was admitted that some portion of trade must in any case cease at the outbreak of war owing to the prohibition of commerce with the enemy. But the gravity of this stoppage was not to be over-estimated since ships can change their routes at short notice, and we were assured that trade would find other outlets with little difficulty.

Gow, q. 2441
Giffen, q. 3025
Binning, q. 1765
Bolton, q. 2968
Roberts, q. 1008.
Bridge, q. 4817, 4821–2
Bridge, q. 4815

34. The special demand of the State at such a time upon the mercantile marine was also impressed on us. Though war may mean a stoppage of business in various directions it also means a large demand on account of the Government. It was even represented that "as a rule war times are very good times for shipowners," and that "there is a great deal of money to be made in them." Shipowners would probably be able to demand higher freights. Enormous supplies are required, and larger provision has to be made to allow for captures, while the Navy itself would require a very large auxiliary tonnage for coal, &c.

35. In the Russo-Japanese war the Japanese Government employed the whole of their mercantile marine. And when war was fairly started it might happen that no

"shipowners would be having their ships laid up; they would all be working as hard as they could," though it would no doubt be true that at the outset the slower ships would be laid up to a greater extent than the fast. Roberts, q. 1004 Sutherland, q. 4274

Transfers to a Neutral Flag.

36. The object of the transfer, if it took place, of British shipping to a neutral flag would be the avoidance of liability to capture and of the extra charges incident on sailing under a belligerent flag. These charges were defined to us as the increased payments that would be necessary in respect of premiums for war insurance and wages for seamen, as well as the extra expenses to which shipowners belonging to a belligerent nation would be liable owing to detention or deviation from their ordinary course by the advice or at the orders of the Admiralty. Binning, q. 1767 Mitcalfe, qs. 4453–4

37. As Mr. Bowles and others pointed out the question of the transfer of British shipping arose the moment the Declaration of Paris was signed in 1856. Under the Declaration the neutral flag is held to cover all goods that are not contraband, and its general effect is fairly described by the phrase "Free ships, free goods." Previous to 1856 the neutral was very little safer, if at all, than the belligerent, and was equally harried, seized and searched. But as soon as it was agreed that the neutral flag should cover the cargo the question of the possible general transfer of ships became important. In Mr. Gow's opinion the advantage which this agreement gave to the neutral is such that there is now both greater possibility of transfer and greater risk of it than in any war of which we have had experience in the past. But it must be remembered that, owing to the uncertainty as to what constitutes contraband, the position of the neutral is not so secure as might appear at first sight, and also that any advantage inherent in neutrality may react to the benefit of the British manufacturer or consumer, for whom it might be 'the cheapest thing' that transfers to neutrals should take place, since they might thereby be assured of a more regular supply of necessary raw materials and food stuffs. The position of the neutral as affected by the very wide definition of contraband prevailing during the war between Russia and Japan is referred to again in greater detail in paragraph 76. Bowles, q. 72 Owen, q. 2119 Gow, q. 2425 Bowles, q. 72 Gow, q. 2427 Harris, q. 604

38. Some witnesses founded their fear of transfers on the experience of the American nation during the civil war when their large share in the carrying trade of the world passed into other hands. No doubt the activity of the Confederate cruisers greatly contributed to the destruction of the American mercantile marine, but the influence of the contemporaneous change from wooden to iron ships and the inability of the American shipyards to keep pace with the new form of construction were a more permanent, if a less immediately important factor in producing this result. Maclay, q. 4048 Balfour, q. 8

39. Transfers to certain countries in time of peace are easily accomplished. An actual case was cited to us where a clerk had been sent over to Belgium to register a limited liability company in that country for the purpose of effecting a legal transfer. A brass plate was put up on the door of an office, the limited company purchased all the shares in the steamer whose transfer was desired, and the ship was automatically removed from the British register and became a Belgian ship. The ease with which transfers to Sweden, Spain, Norway and Denmark can be effected was also referred to, though it was said that recent rules in Norway imposing restrictions as to load line, and a tax on transfers in Denmark had made the acquisition of the right to hoist these flags more difficult than it used to be some years ago. Harris, q. 507 Miller, q. 3431, 3454 Bowles, q. 154 Mitcalfe, q. 4397

40. In war the temptation to transfer would be greater or less according as the enemy was more or less powerful at sea and more or less favourably situated for naval operations against us. Thus, as was pointed out by Mr. Bowles, if we were at war with Austria, Turkey, Greece or Venezuela there would be little temptation to British owners owing to danger from the enemy. But the temptation might be considerable if we were at war with France or with Germany or the United States. Bowles, q. 74

41. Apart from the varying intensity of the desire to transfer, the practical difficulties in the way of effecting a legal transfer on a large scale are considerable.

Two obstacles are especially prominent, (1) the internal legislation of some at least of the countries which are in other respects best fitted to make the purchase, and (2) the probability that no strong belligerent would acknowledge a transfer obviously intended to deprive it of the power of exercising its belligerent rights unless the nation accepting the transfer was both willing and able to defend its action. Sir Thomas Sutherland was of opinion that the difficulties of transfer after the declaration of war were almost insurmountable, though he admitted that if a powerful neutral, such as the United States of America, were the accepting nation, it would be doubtful whether any belligerent would care to challenge its action. In this case, however, he thought that another difficulty would arise, since the necessary engineering and shipbuilding establishments for executing repairs do not at present exist in that country on a sufficient scale, and their absence would, in his opinion, prevent the acceptance of transferred ships, even if the municipal law and command of capital allowed it.

Bridge, q. 4814

Sutherland, q. 4259

Sutherland, q. 4260.

42. Sir Robert Giffen and others pointed out that as the legislation of the United States of America at present stands it is impossible for any British ship to be transferred to the American flag, but he differed from them in thinking that there need be no apprehension of transfer to any great Power which would afterwards compete with us in our oversea trade.

Giffen, q. 3053

Hill, q. 3786

Gow, q. 2651

Giffen, q. 3078

43. Mr. Bowles, in opposition to the opinion expressed by Professor Holland before the Royal Commission on Food Supplies, thought that legal difficulties did not really exist, and could "see nothing in practice or in principle or in previous history that would justify or encourage a belligerent to refuse to recognise a transfer lawfully made." But at best the conditions of transfer are stringent, as was shown in the case of the "Baltica," which Mr. Bowles quoted to justify his contention. The legality of the transfer in this case was only admitted on complete proof being afforded of the neutral status of the purchaser, and the absolute and *bonâ fide* character of the sale.

Balfour, q. 8

Bowles, q. 75

Bowles, q. 163

Giffen, q. 3053

44. Again, transfers to be a serious question would have to be on an enormous scale, and doubt was expressed whether in time of war neutrals could find sufficient capital for such a purpose.

Sutherland, q. 4259

Estall, q. 3845

Jones, q. 289

45. As against this some witnesses were of opinion that the apparent difficulties in the way of transfer lay rather in the state of municipal law which might be altered to suit the case, than in the magnitude of the commercial operation. They thought it would be to the interest of the neutral to facilitate transfers to its flag, and that an enemy might be satisfied with loss inflicted on us by the transfer of our shipping without trying to follow up that shipping after it had been transferred.

Gow, q. 2423

Gow, q. 2416

Jones, q 302

Gow, q. 2419

46. So too Mr. Norman Hill with special reference to the legal difficulties prevailing in the case of America, thought that the United States could justify a special relaxation of its rules on the ground that American exporters and cargo owners needed protection from the heavy charges that would be levied on them if they continued to ship goods under the British flag at a time when Britain was a belligerent.

Hill, q. 3788

47. And finally Mr. Bowles pointed out that as far as the question of available capital was concerned, the transaction "would finance itself on the supposition that is made . . . . . a great trade to be done, the ships which ordinarily do it . . . . laid up through being unable to sail under the belligerent flag, and . . . . to be had cheap."

Bowles, q. 75

48. (*a*) On a review of the foregoing evidence, and on full consideration of the probabilities of the case, we think it unlikely that the laying up of ships would take place on any large scale or last for any appreciable time. Some ships might be detained in port for a short time whilst their owners watched the development of events and decided upon the best course to pursue. Some would undoubtedly have to be diverted from the trade in which they had hitherto been engaged to other routes. But British shipping is too important a factor in the world's carrying trade to admit of any large portion of it for long remaining idle. The rise in freights, the prospect of increased profits, the large demands of the

British War Office and Admiralty in the case of any serious war (with which alone we need concern ourselves) would rapidly compensate for the increased risk and tempt suitable ships to sea again. We do not therefore regard this as a serious danger.

(*b*) The question of the transfer of shipping to a neutral flag is more difficult and complicated. From the summary of the evidence which we have given above it will be seen how various and conflicting are the views even of expert witnesses as to the probabilities and even the possibilities of the case. There can be no question that it would be matter for the gravest regret if transfers were to take place on any considerable scale just before or during the progress of a war in which this country was involved. Such transfers once made would be likely to be permanent, and there is some force in the opinion expressed by Mr. Norman Hill that they would carry with them more than the loss of the actual ships because of the tendency for the home port to be determined by the flag. Hill, q. 3794

(*c*) Upon a review of all the evidence it appears that trade in time of war, and especially during the great uncertainty which would prevail in the first few weeks of war, would have a tendency to seek neutral bottoms in the hope of avoiding the risks and expense to which belligerent vessels would be exposed in addition to those that would fall upon neutrals.

(*d*) But we have not been convinced that the probability of transfers of shipping on a large scale is so serious as of itself to demand special preventive measures. The advantage of neutrals over belligerents in the matter of charges for war insurance or freedom from interference is, under the Declaration of Paris, a good deal diminished by the great uncertainty which prevails as to what will and what will not be contraband of war, and by the very wide definitions of contraband adopted by belligerents from time to time. The municipal law of those countries which would otherwise be the most likely purchasers is, generally speaking, framed in such a way as to place great difficulties in the way of transfers.

(*e*) At the same time it must be admitted as probable that neutrals will take advantage of a time of stress to acquire a larger share of the world's shipping. We do not think it likely that in any case the transfers will bear a large proportion to the total of the British mercantile marine; but in so far as they may be effected, they constitute an injury to our trade which it will be difficult, perhaps impossible, to recover after the restoration of peace.

49. The danger of any material interruption to our supplies of food and raw material is mitigated by the fact that such supplies would be shipped, in part at any rate, in neutral bottoms if British ships found the traffic too dangerous, and any belligerent with whom this country might be engaged in war might well hesitate to incur the hostility of a great Power, such as, say, the United States of America, whose vessels were so engaged, by treating such articles as contraband of war.

War Insurance.

50. The extent of the market for war risks and the effect of insurance premiums and other factors influencing prices to the detriment of British trade in war time have now to be considered. The evidence submitted to us was strangely divergent. There were great differences of opinion even among those whose interests were similar. In effect it appears that only experience can decide what will be the extent of the market, the rates of insurance that will prevail, and the result that they will have upon the prices charged to consumers. But the evidence heard on these subjects is interesting, and at least throws some light upon the conditions prevailing.

The Market for War Insurance.

51. In some trades, such as the nitrate trade with South America, the practice is for shipowners to insure against war risks even in time of peace, and a war premium of

Beck, q. 1331–2
Beck, q. 1202

1s. 3d. per cent. is charged in addition to the ordinary premium for marine risks. The market for war insurance in peace time was stated to be unlimited. But with the prospect of war there is hesitation. We were told that in the beginning of war the insurance market would not be sufficiently large to "absorb one-fiftieth part of the business to be done," but that presently it would gain confidence. And the evidence given before a Committee of the House of Commons in 1821 was quoted, to the effect that in the Great War at the beginning of the last century the insurance market of those days was greatly restricted at the outset, but that by the end of the war "underwriters at Lloyd's were taking lines running up to £10,000 a name, and the profit that was made was very large."

Harris, q. 636

52. In Mr. Beck's opinion, "in the event of the outbreak of war, the present market for insurance of vessels and cargoes against war risks would shrink up." He said that prior to war there would be a very large market, but that after the outbreak of war, and in the probable event of captures, which he thought would take place immediately, the market "would almost entirely shrink up, and the few underwriters or companies engaged in the business would put the rates up to an absolutely prohibitive size for the carrying on of commerce." While Mr. Gow thought that the market would be restricted for about ten days before the outbreak of war, but that after the commencement of hostilities, "people would begin to think of business again."

Beck, q. 1201

Gow, q. 2559

Bolton, qs. 2765 2769
Roberts, q. 855
Roberts, q. 859
Roberts, q. 860
Roberts, q. 859
Roberts, qs. 898–900

53. Mr. Bolton, who spoke both as a shipowner and underwriter, feared for the sufficiency of the market to meet the losses which it would be called upon to pay, and was of opinion that it had not expanded in proportion to the increase of shipping since the great French war. But Mr. Roberts, who is also an underwriter, took the contrary view. He was not afraid of panics, and thought that the size of the market would always be sufficient to prevent anything like a successful combination to charge prohibitive rates. He pointed out that whereas in recent wars the war risks have been concentrated in one particular spot, and have of necessity been high, "when you get the British Empire at war, the thing is so enormous that it would appeal to every underwriter." He added that the amount of insurance would be large, and underwriters would therefore receive a large amount of premium out of which to meet their liabilities on losses, and he only anticipated demoralisation in the event of a blockade of these islands so effective as to make captures a practical certainty. He admitted that in war time there might be some difficulty in placing large single risks, but he thought there would always be a free market up to £200,000.

Lemon, q. 1179
Wright, q. 1975
Wright, q. 2038
Gow, q. 2604

54. Other witnesses thought that the market would only become limited in the event of serious captures taking place at the commencement of hostilities, and held that, so long as the fleet was undefeated, there would be no real difficulty in covering the whole of the British mercantile marine against war risks. Increased premiums would even tend to enlarge the market provided they appeared to be adequate.

Estall, q. 3993–4
McArthur, q. 4573
Jeans, q. 4150
Nugent, q. 3587

55. Mr. Estall, speaking as a banker, expressed his belief that the insurance market was large enough to meet even abnormal losses, and said that bankers would have no fear that policies would not be honoured. Mr. McArthur spoke in the same sense, and added that the large reserves of the principal marine insurance companies precluded any probability that they would not be able to fulfil their obligations in war time. Mr. Jeans, however, was not so confident, and said that a banker was apt to become anxious about his insurances whenever war appeared imminent; and Mr. Nugent, speaking for the discount market, said that bills and securities would be examined more carefully, as they were during the Fashoda incident, and recently in the Russo-Japanese War.

56. In view of the speculative character of the question, of the absence in recent times of any practical experience of naval war between two great naval Powers, and of the conflicting opinions of men equally interested in arriving at a right judgment on the subject and equally competent to do so, we have great hesitation in offering an opinion of our own; but we are inclined to believe that though the market for war risks might be seriously restricted just before and after the outbreak of a great naval struggle, and though rates might be subject to violent fluctuations at such a time, yet that if our Navy did not sustain any serious reverse the market would expand

and become steadier as the situation developed, and that there is not sufficient evidence to justify the belief that private enterprise would be insufficient to bear the financial strain that is likely to be put upon it.

But it is necessary to repeat that we assume throughout these observations that the supremacy of the British Navy is unimpaired. A contrary hypothesis would indeed upset our conclusions, but in such a case a National Guarantee of our sea-borne commerce would only hasten the ruin of the Exchequer without averting the ruin of the Nation.

War Premiums.

57. The rates at which war insurance might be effected are obviously closely connected with, and in a large measure dependent on, the extent of the market for those risks, and, as such, have been mentioned in the last paragraph. But it will be desirable to examine this branch of the subject in greater detail, for it is possible, as suggested by one witness, that there should be a practically unlimited market "at a price," but that that price should be so high as to be prohibitive of business on any large scale. The war rates of the future must in any case be a matter of speculation, and when the circumstances on which they depend are so unknown a quantity as the conditions that may prevail in war between Great Britain and any other Power or Powers, it may be questionable how far it is profitable even to enter into a discussion as to their probable amount. Roberts q. 944

58. Sir Robert Giffen, for instance, regarded war insurance, especially at the beginning of a war, as "a gamble," but thought that Lloyd's was the most likely place where "a commonsense and practical view" of the state of affairs would be taken. He was not apprehensive of violent fluctuations continuing for a long time. He agreed with other witnesses that past experience such as that of the great war at the beginning of the last century could have but little value in these days. Giffen q. 3090 Giffen, q. 3088 Giffen q. 3092 Roberts, q. 935 Boulton, q. 1518 Bolton, q. 2766–9

59. Mr. Roberts argued that the increase in marine risks in time of war was in reality a war risk, the rise being due to the fact that, although the policy of this country was to keep its coast lights burning in time of war, there are nations which might not do so, and navigation lights might not always be used, introducing greater dangers from both causes. Roberts, q. 968–76

60. As to the forecasts made of the rates that might prevail;—on the supposition of a strong naval combination against us, Mr. Roberts put the war rates on a ship coming from Canada at about 2 per cent., while Mr. Lemon placed the premium for the same voyage, if we were at war with the United States, at from 8 to 10 per cent. Mr. Gow placed the rate at 5 guineas per cent. if a North Atlantic war were imminent, and thought that several captures in the early weeks of war would send up rates to 30 guineas. Mr. Beck thought that a rate of 2 or $2\frac{1}{2}$ per cent. would be sufficient to stop trade on long voyages, while Mr. Estall thought that 15 per cent. would not stop it. Roberts, q. 902–3 Lemon, q. 1193 Gow, q. 2606 Gow, q. 2610 Beck, q. 1469 Estall, q. 3823–4

61. In the case of a war with France, Mr. Lemon thought that a fair premium on a voyage from the Black Sea to this country through the Mediterranean would be 25 to 30 per cent., unless it was known that the French fleet was engaged elsewhere; while Mr. Boulton put the probable rate at 5 guineas per cent. Lemon, q. 1190 Boulton, q. 1666

62. The experience of wars in which we have not been a belligerent seems opposed to the prevalent idea that the rates rise in the early stages out of all proportion to the risk. In the Russo-Japanese war rates were low at the outset. Mr. Wright told us that competition had tended in the past to depress rates below a remunerative level, and he added that though war premiums were seldom in exact correspondence with the risk they were just as often below it as above it. In his opinion the tendency would be to under-estimate the risks, "if the British fleet kept its end up"; if it did not, then ships would not be insurable at all. The capture, say, of one or two Atlantic liners would have a "tremendous" effect upon the insurance market, though the loss of three tramps in a day between Gibraltar and England, while raising premiums considerably on this voyage, would hardly affect Atlantic voyages. Beck, q. 1221 Wright, q. 1972 Wright, q. 2034 Wright, q. 2055 Wright, q. 2066

63. It is obvious from the above that any estimate of probable rates which we might be tempted to make would be mere guesswork. We are, therefore, unwilling to hazard an opinion on the subject. But we feel we are on surer ground in acquiescing in the view that a man does not ship in time of war unless he expects to make a large profit, and that no rate of insurance can with certainty be described as prohibitive, without a full knowledge of the circumstances of the particular case and time in which it is attempted to be charged.

(Roberts, q. 891 Miller, q. 3458 Binning, q. 1924)

64. But, while we think it quite impracticable to state any figure for the market rates of insurance in time of war, we think it may be fairly anticipated:—

(1) That the initial rates will probably be based on the public estimate of the strength and readiness of the Navy in comparison with that of our opponents.

(2) That the general level of rates is likely to be higher during the period of tension just before the outbreak of war and during the earlier stages of the war, than later on when the risks could be more accurately gauged, and perhaps even certain routes declared to be comparatively safe.

(3) That initial successes or defeats will probably have a marked influence on the scale of rates not only at the moment but for some time afterwards.

(4) That the extent of the market for the insurance of war risks and the rates at which these risks will be insurable will depend upon the circumstances and area of each particular war, on the sea-power and facilities for attack of the other belligerent or belligerents and on the comparative strength and efficiency of H.M. Navy in relation thereto. But;

(5) That if command of the sea be assured, and proper protection given to commerce, the high rates which may be expected to prevail at the opening of hostilities will quickly give way to more moderate prices, and private enterprise will be equal to affording the facilities required by the country's trade.

Rates of Insurance Compared with Other Factors Influencing Prices in War Time.

65. We are, however, of opinion, that the effect of any probable rise in rates on the general level of prices and on the operations of trade and industry has been exaggerated.

66. As Mr. Bowles remarked, "The circumstances which finally govern prices are so numerous and so complex that it is a very rash thing to predict what the effects of anything in the world will be upon prices," and in a memorandum, which is printed as an Appendix, he laid before us some interesting information as to prices in the great French war. He thought that although considerable and even violent fluctuations of price within a limited period were very possible, yet that owing to the increased sources of supply and greater facilities of transport, these fluctuations would be within narrower limits than in former wars. In his opinion, of all the factors influencing prices, war risks would be the least important. Sir Robert Giffen and others took a similar view, and it was argued that the price of commodities at a port of discharge did not depend on the original cost to the individual merchant or shipowner, but on whether there was a scarcity or super-abundance of the article imported. If there was a scarcity, no scheme of insurance by the State could ever prevent the price from rising; and, on the other hand, if the supply exceeded the demand, then, however high the war premium, the price of the article must be depressed. While Mr. Gow, a Liverpool representative, referring to the opinion of special classes of merchants whom he had consulted, said that in the cotton market and the grain market, the rise in prices "would be incomparably greater than any amount of war premium that could be imagined."

(Bowles, q. 92 — Bowles, q. 248–9 — Bowles, q. 93 — Giffen, q. 3058 — Wright, q. 1979 — Gow, q. 2412)

67. Sir Robert Giffen was further of opinion that the disturbance of trade would be so great in war time that the mere rise in freights due to war premiums would be

practically a negligible quantity. He argued that a state of war did not necessarily lead to a general rise in prices, though it led to "a rise of prices in particular articles, according to particular circumstances, which require to be very carefully considered"; and further, that prices did not necessarily rise unless the production of the particular article was stopped. He drew our special attention to a fact to which he attached great importance, namely, that "the price of wheat did not rise during the American civil war, although at that very time the price of cotton rose so extravagantly." Giffen, q. 3057 Giffen, q. 3058 Giffen, q. 3076 Giffen, q. 3108

68. In his opinion the immediate effect of war between this country and a first-class Power would not improbably be a financial panic of unprecedented dimensions, and a suspension of specie payments as in 1797. He pointed out that the United States had suspended specie payments in 1861 and 1862, and that in 1870 France had not only suspended specie payments but had also enacted a moratorium for bills. Large gold withdrawals were also to be expected, as happened in the Polish war of 1831-2, the Revolution of 1848, the Crimean war, the American Civil war, the Austro-Prussian war of 1866, in the Franco-Prussian war of 1870, and to some extent the Russo-Japanese war. It might also happen that we should not have money coming to London for security if we were one of the belligerents, as it has done in former wars, and "the question would be whether anybody could live through." Giffen, q. 3004 Giffen, q. 3005 Giffen, q. 3060.

69. On the other hand, Sir Cyprian Bridge, Mr. Estall, Mr. Toomey and Mr. Strachey thought that the rates for war insurance would count for a good deal in the rise of prices to be expected in time of war, Sir Cyprian Bridge giving it as his opinion that prices would rise beyond the cost of transport and insurance, even though there was no diminution in the quantity of commodities coming into this country. He thought that the apprehension of the shipowner for the safety of his ship would lead to high freights, and the fear of underwriters as to what they might have to pay in case of loss, and the consequent high rates of insurance, would between them make a double rise which might be transferred to the prices charged to the consumer. Estall, q. 3839 Toomey, q. 4640 Strachey, q. 4920. Bridge q. 4801–3.

70. Upon a review of the evidence on this point, we are of opinion that the effect of any probable rise of insurance rates on prices has been exaggerated by the advocates of a National Guarantee. Without accepting in their entirety the opinions expressed by Sir R. Giffen, we think that he and other witnesses have shown that the cost of war insurance would be only one, and by no means the most important, of the many factors controlling prices at the outbreak and during the continuance of a great naval war.

The Experience of Recent Wars.

71. Many of the shipowners and underwriters who appeared before us based their opinions on their experience in recent wars or referred to these wars for confirmation of their views. The rates of insurance to be expected, the relative risks of belligerent and neutral shipping, and the question of possible transfers were all illustrated from recent events. It may be well to note at this point some of the special instances quoted. The war between Russia and Japan came more prominently before us than any other, but references were also made to the Spanish-American war and our own South African war.

The Russo-Japanese War.

72. With regard to Government demands in time of war, we were told that the Japanese Government absorbed the whole of the Mercantile Marine for purposes of State. Bridge q. 4815

73. With regard to the rates of insurance, the great variation in the premiums asked is most noticeable. So far as vessels that were not carrying contraband were concerned the premiums demanded were not excessive. Rates on neutral property varied from 10s. per cent. to 7 guineas per cent. According to one witness the rates of insurance to Japan were "absurdly small," it being supposed that the Japanese Mitcalfe, q. 4316 McArthur, q. 4579

Wright, q. 1981 would prevail on sea, whereas the "rates to Vladivostock were gigantic," because the Russians were thought to be weak. Even so, the rates in the latter case were insufficient, and underwriters lost money. A premium of 30 guineas was paid regularly on all coal shipments to Vladivostock for the Russian Government, and 50 guineas in some cases after the fall of Port Arthur; and "probably four out of five of them were captured."

Binning, q. 1914–15
Roberts, q. 872
Lemon, q. 1039

74. The whole difficulty of effecting insurances during the war seems to have been concentrated on Vladivostock, which can be approached only "through the Straits of Tsushima, or north *viâ* La Pérouse, or *viâ* Cape Elizabeth and Saghalien." The premium of 30 guineas was based on the supposition that vessels would be able to take the La Pérouse route, but this was rendered impossible by the unusual blocking of the ordinary channels by ice. The ultimate losses which underwriters suffered were stated to be due to shipowners insisting on proceeding with the voyage, "almost persisting in capture."

Roberts, q. 856
Beck, q. 1379
Beck, q. 1378
Beck, q. 1230

75. On the other hand, even in July, 1904, a cargo of rice in a ship bound from Rangoon to Japan, which "would rather take it within the region of any Russian cruisers at Vladivostock," was insured at $\frac{3}{8}$ per cent., and at the end of October in the same year a large amount of canvas was insured to Japan at $\frac{1}{2}$ per cent. Again, in the case of ships to Japan, the premium "may have been 3 per cent. at the first," but as soon as her superiority was established the rate "fell away to a very nominal one." Japanese vessels carrying flour from the West Coast of North America were insured at 20s. to 40s. per cent., "which is quite moderate."

Roberts, q. 870
Binning, q. 1762–3
Binning q. 1880

76. There was considerable complaint as to the uncertainty felt on the subject of contraband, and the position of neutrals in respect of war premiums was little if at all better than what we may fairly imagine that the position of ships belonging to the belligerents would have been had there been a sufficient number of them to carry the goods required. Doubt existed both as to the nature of contraband and as to the position of neutral shipping carrying what was avowedly contraband. It was of course known that contraband goods were liable to seizure, and that the vessel carrying them might, under certain circumstances, incur confiscation. But the penalty of confiscation of the vessel was according to some of the witnesses before us enforced by Japan upon an unexpectedly large scale. "It was held by Japan that the ships were liable to capture, and they have not returned them." "In fact, all the steamers captured were under neutral flags."

Harris, q. 578
Roberts, q. 870

Any extension of the doctrine of contraband naturally affects the position of the neutral, and a number of witnesses reiterated the complaint that "we never know what is contraband and what is not." In this war vessels were captured with very little reference to previous declarations, "because there was no agreement about contraband, and the law of contraband was very much extended by the Russians." "That is what we suffered from in the Japanese war. We paid for vessels which had no contraband on at all, but they were considered contraband." One witness said that the definition of contraband had been "our greatest difficulty throughout," and gave an instance of a claim made on behalf of a ship with a cargo of oil that had been destroyed After a lapse of two years judgment was given in favour of the shipowner, that the cargo, being oil, was not contraband; but, on the case being taken to another court to enforce payment, "the Russians described the cargo as 'pétrole,' and repudiated everything." Another witness, though admitting that in a European war there might be a tendency to grant lower premiums to neutral goods in neutral bottoms, upheld the extreme view that the war had proved that the Declaration of Paris was in effect non-existent, and that neutral ships were liable to capture even when they were neither carriers of contraband nor consigned to a blockaded port. And a third concluded from his experience of the war that "the supposed immunity of neutral vessels is largely illusory," and that in future nations would do whatever they could to inconvenience the other belligerent "so far as they could do so without inconvenience to themselves," the only deterrent being the possibility of quarrelling with the neutral if they carried interference to a vexatious extent.

Mitcalfe, q. 4362
Roberts, q. 987–98
Wright, q. 1987
Wright, q. 2027
Wright, 2028

77. To show how carefully the risks were estimated at Lloyd's, Mr. Beck told us that in the early part of the war, vessels under the English flag carrying coal to

Japan were insured for ½ per cent., and these vessels, though stopped in the Red Sea by Russian cruisers, were allowed to continue their voyage. But, with the progress of the war, the Russians did not wait to comply with the rules of warfare as laid down in books, and sank the ships at once, and the rates were then raised to 30 guineas per cent. Beck, q. 1221 q. 1219

78. The same witness informed us that the lessons learnt by underwriters in this war, were :—

(a) That all possibilities or probabilities based upon the past are absolutely fallacious; (b) that, in future, no captures will be made by an "Alabama," but only by a war vessel of some sort kept in communication with the mainland by means of wireless telegraphy; (c) that capture by the enemy will be looked upon as a very useful market by shipowners, and must be guarded against. Beck, q. 1266

Other Recent Wars.

79. Of the *Spanish-American War* (1898) we were told that the only serious damage to commerce by either fleet was occasioned by the capture of Spanish ships loading in the Gulf of Mexico. "They (the Americans) stood in the Gulf of Mexico and swept it. That was three days before war was declared." War risks in America went up to 12 guineas per cent. when a Spanish squadron sailed east through the Suez Canal, the Americans thinking that the Spaniards meant to attack them on the Pacific coast. But "here these risks could always be covered . . . at 2 per cent." The fact that neither belligerent was very much dependent on oversea supplies, and that the war was on a comparatively restricted scale, makes it impossible to infer from it what would happen in our own case. "The only thing one did observe," said one witness, "was a very sudden rise in the price of cigars." Roberts, q. 901 Roberts, q. 859 Gow, q. 2438–40

80. With reference to the *South African War*, our attention was called to the large demands on the mercantile marine for purposes of transport, and the general increase in the prices of charter parties and freights to all parts of the world. Gow, q. 2441–2

81. We do not consider that the experiences detailed above are sufficient to afford material for any definite conclusions of general application. It is, however, worth while to note as bearing upon our inquiry—

(1) The large demands upon the mercantile marine made by our own Government and the Japanese Government in the South African and Russo-Japanese wars respectively.

(2) The comparative moderation of the rates of insurance asked in respect of the shipments to Japan owing to her naval superiority.

(3) The enormous premiums asked for shipments to Russian ports in the far East owing (a) to the geographical position of those ports in the far East; (b) to the inferiority of Russia at sea.

(4) The uncertainty prevailing on the subject of what does, and what does not, constitute contraband of war.

(5) The fact that the high rates here mentioned were charged on neutral shipping which would appear to have fared little, if at all, better than belligerent shipping might have done had it been available in sufficient quantity to carry the trade.

Naval Policy and the Protection of Commerce.

82. We have more than once referred to the absolute necessity, whether any scheme of National Guarantee be adopted or not, for maintaining our naval supremacy. It is indeed obvious that the national object must be to secure the arrival of supplies rather than to provide individuals with an indemnity for their losses. In the words of Sir Thomas Sutherland, "It is absolutely necessary, if you are going to have any insurance system that will be operative, that we shall have a very strong Navy, because other

Sutherland, q. 4259 wise any scheme of indemnity with regard to shipping in war time would . . . become a dead letter." As has been mentioned already, he thought that neither ship-
Sutherland, q. 4260 owners nor seamen would care to tempt their fate on the mere chance of recovering insurance if the danger of capture, imprisonment, and loss of life were very serious.

83. The witnesses who came before us were as insistent as those who appeared before the Royal Commission on the subject of the Strength of the Navy. In Mr.
Estall, q. 3912 Estall's opinion, "The whole commerce, and every thing, entirely depends upon the strength of the Navy, and the number of cruisers capable of protecting our commerce."
Sutherland, q. 4276 And, in another place, Sir Thomas Sutherland agreed that, "Whatever money we have to spend had better be spent on keeping the Navy strong than on paying for losses which might occur through a weak Navy."

Bridge, qs. 4834, 4836 84. In the course of his evidence Admiral Sir Cyprian Bridge defined the object of commerce destroying as against this country as being to make the British Isles a blockaded area, though he admitted that the difficulties of imposing anything like a real blockade on our coasts would be enormous. Mr. Bowles gave us a graphic sketch of the natural protection which the United Kingdom enjoys, calling our attention to the width and number of the approaches to the British Isles. He said that "from Norway to the Orkneys is 300 miles, from the Orkneys to the northern end of Ireland is 350 miles, from the Northern end of Ireland to Cape Clear at its southern end is 300 miles, from Cape Clear to the Scilly Islands is 150 miles, and from the Scilly Islands
Bowles, q. 79 to Ushant is 100 miles," or 1,200 miles of sea in all, every mile of which has to be stopped before access to the British Islands can be prevented.

Bowles, q. 172 Harris, q. 633 Boulton, q. 1506 Boulton, q. 1508 Boulton, q. 1714 Harris, q. 633–5 85. But though the avenues of approach are wide, the dangers to the Mercantile Marine under modern conditions are also great. Thus Mr. Bowles himself declared that the regulations as to privateering were of little value. We were told that it would be easy for an enemy to commission vessels for the purpose of commerce destruction, since all that is necessary for the purpose is an "antiquated gun that will throw a 3-inch shell 250 yards." The helplessness of merchant steamers in time of war had been very much impressed on some witnesses by their experience in the Russo-Japanese war, and it was felt that they would be "like a flock of sheep with a wolf amongst them" whenever a cruiser appeared on a trade route.

Balfour, q. 7 86. The impression made upon Lord Balfour's mind by the evidence taken before the Royal Commission was that the policy of the Navy would be to protect commerce not by convoys, but by bottling up the hostile Navy in its own ports. And we were confirmed in this impression by what we gathered from the witnesses who appeared before us. We believe, however, that it is admitted by naval authorities that no blockade, however effective, can at all times prevent the escape of one or two of
Sutherland, q. 4261 the beleaguered ships. In Sir Thomas Sutherland's opinion, "What one would have to fear most would be the escape of a cruiser, say, from blockade."

Bridge, R. C., on Food Supplies, q. 11275 87. We desire to call special attention to the evidence of Sir Robert Giffen and Sir Cyprian Bridge. Sir Cyprian Bridge had been one of the witnesses before the Royal Commission, and came to us after having devoted special consideration to the Commission's Report. He wished to emphasise the remarks which he then made as to the need of a sufficiency of cruisers to keep the enemy's commerce destroyers continually on the look out for their own safety. Sir Cyprian Bridge's argument was that although a nation would probably suffer if its naval strategy was based on the destruction of the enemy's commerce, yet it was not unsound to make it a subsidiary object. He thought that in the case of war with the United Kingdom there would be peculiar justification for an enemy to regard commerce destruction as an immediate object of strategy, since the aim would be to enclose these islands in a blockaded area, which would have to surrender if supplies were cut off. In his opinion it was very unlikely that an enemy would be able to carry out their purpose, though they would make us very uncomfortable in the process. His actual words were, "They (the enemy) would get to some extent a run for their money if they did it. There would
Bridge, q. 4862 be very great temptation on their part to do it; it would undoubtedly injure us to some extent." He added that it was not easy to understand why certain nations have
Bridge, q. 4864 outlying fortified ports unless they were intended to act as convenient bases for the attack of our commerce.

88. Sir Robert Giffen expressed the apprehension that "the Admiralty may be too much under the impression that what they have got to do is to beat the enemy." He thought that the prevention of certain evil consequences of war was no less a part of their duties, and should be kept in mind; and he argued that while the damage in war from a particular military occupation might from a military point of view be comparatively small, from a moral point of view it might be so considerable that it became an important strategic factor. Giffen, q. 3084 Giffen, q. 3123-3129

89. In the Report of the Royal Commission 33 paragraphs are devoted to a consideration of the "Extent to which Trade with the United Kingdom can be protected from interference on the part of an enemy during a maritime war." And in the main we agree with the findings of the Commissioners. No scheme of National Guarantee can compensate for the absence of effective provision for the protection of commerce and of carefully prepared plans of commercial defence. Nor will the offer of a monetary indemnity to individual traders supply the Nation with its necessities or relieve the Admiralty from the pressure of public opinion if serious losses occur; whilst to encourage the supposition that since individuals received compensation, the importance of protecting our sea-borne commerce was in any way lessened, must under any scheme, whether of insurance or indemnity, be attended with disastrous consequences to the Nation. Report of R. C. on Food Supplies, pars 115–148

90. It is no part of our duty to indicate in what way this necessary naval protection may be most effectively given to our shipping, nor do we feel competent to attempt the task. But we should fail to express the deepest impression which the evidence we have heard has left upon our minds if we did not place clearly before your Lordships our profound conviction that any scheme of indemnity can at best be only an adjunct to and not a substitute for effective naval protection.

Part III.

91. Certain questions incidental to the adoption of any scheme of National Guarantee have now to be considered.

These questions have reference to:—the allegation that an indemnity would in effect confer a bounty on shipowners and be unfair to other interests not similarly protected; the ability of shipowners and merchants to contribute under a system of insurance; the cost, and the incidence of the cost, of an indemnity; the effect of a State scheme on the reputed ownership of goods and on the action of enemy prize courts; the need for and effect of Admiralty control; the possibility of separating sea risks from war risks in such a way that the State may undertake the war risks without prejudice either to the shipowner or merchant in respect of his cover for sea-risks; the danger of fraud; and the difficulties of administration and machinery.

The Argument that Indemnity would be Unfair to other Interests, and would Confer a Bounty on Shipowners.

92. Here, as in so many of the questions which were discussed with witnesses, there was some conflicting evidence. Shipowners and others directly connected with shipping interests were inclined, as was but natural, to minimise the particular benefit that might be expected to accrue to them. Stress was laid on the extra expenses in the matter of wages and cost of provisions to which they would be liable as belligerents, and it was urged that it was fairer to distribute losses through the medium of taxation than to allow shipowners and cargo-owners to bear the burthen of loss directly. Lord Balfour felt that the risk of indemnity being regarded as a special protection for the benefit of a particular industry at the expense of the whole community was one that might fairly be taken because of the benefits to be derived from the existence of a scheme. But that indemnity might act as a special protection was admitted by a shipowner, Mr. Brightman, who thought that the free compensation of a particular interest was likely to be regarded as inequitable to the community at large, and by Mr. Miller, who said that "one would have to be educated up to it" (*i.e.*, to the idea that indemnity did not unduly favour a particular interest). Harris, qs. 612-614 Balfour, q. 33 Brightman, q. 3337 Miller, q. 3472

Another witness pointed out that others besides ship and cargo-owners are affected by, and often insure themselves against war risks. "For instance, a banker holding Consols in the ordinary course of business" may insure them, since if war breaks out Consols may fall 10 per cent., and that may mean a loss of hundreds of thousands of pounds to him. And Mr. Estall, who gave a similar example, held that any system of indemnity would constitute a preference in favour of shipowners and merchants against the general community. It will also be remembered (*vide* par. 11) that at the last annual meeting of the Association of Chambers of Commerce, there was evidence of a strong feeling that it would be unfair to confine the indemnity to maritime risks.

Nugent, q. 3570

Estall, q. 3859, 3970

93. It is further interesting to note the admission from the representative of the Liverpool Steamship Owners' Association that if no premiums were charged, British shipowners might not only benefit from the absence of premium as compared with neutrals, but would also benefit by some additional freight which they would be able to secure in competition with neutral ships. Mr. Bolton admitted the fact frankly, saying, "No doubt by the scheme of indemnity you do benefit shipowners and cargo-owners, but you cannot help it. You do not do it for that purpose; that is incidental."

Hill, q.3804

Bolton, q. 2855

94. To Mr. Wright "the notion of giving away this indemnity" seemed "grotesque," and he added that, in his opinion, a free grant would amount to a bounty to shipowners and merchants, and a subsidy to foreigners, since a large number of steamers enjoying British register are owned entirely by foreigners, and, it might be, a subsidy to the enemy, owing to the transfer of the ownership of goods which the scheme might cause. To this last point we return later. Others spoke of an indemnity as a "bounty," or even as a "handsome present" to the shipowners at the expense of the country; while to Sir Robert Giffen it seemed that "those receiving the indemnity obtain a special advantage as compared with the rest of the community, which is equally suffering losses."

Wright q. 2040
Wright, q. 1983
Wright, q. 2002
Wright, q. 2003
Binning, q. 1832
Roberts, q. 874
Giffen, q. 3044

95. We have already indicated our opinion (Paragraph 48 (d)) that the war charges on neutrals will be considerable. To give, therefore, a free indemnity against all the risks of war to our own shipping would place it actually in a better position for competing with foreigners in war than in peace. It must also be acknowledged that it would single out for special protection by the State a particular class of industry and investment. No doubt this class is of special importance to the trade of the country, and stands in some respects in a peculiar position, but the losses of war would not be confined to the people covered by the suggested guarantee, and it is hardly to be expected that other interests which were also suffering would be very willing to contribute largely to a scheme from the direct benefit of which they were excluded.

Contributions from Shipowners and Cargo-owners towards the cost of a State Scheme.

96. If the conclusion at which we have arrived in the foregoing paragraph be correct, and the grant of a free indemnity to our shipping and overseas trade in time of war be in fact something more than an equalisation of conditions between British and neutral trade; if it would amount, as we think it would, to a positive bounty, placing British shipping actually in a more favourable position in competition with neutrals than it occupies in time of peace, then there is obviously no intrinsic injustice or inherent negation of the object proposed by the advocates of a National Guarantee in requiring, as many of them do, some contribution from the shipowner or cargo-owner, or both, towards the expenses which the State by any such scheme takes upon itself. We have accordingly sought to ascertain by what means such a contribution could be best secured and how far any of the different schemes suggested would be likely to meet with the favour of those most immediately concerned.

97. Various plans, having this object in view, have been brought to our notice. We do not propose to describe them here at any length for reasons which will become

apparent as our report proceeds, but they fall generally under one or the other of the following categories :—

(1) That the State should in time of war take the place of the ordinary channels for the insurance of war risks.

(2) That a special tax should be charged in respect of British and neutral shipping and imports during war, so as to form a fund for the indemnification of captured ships and cargoes.

(3) That a small fixed contribution should be levied on ships, which should in reality be little more than a registration fee.

(4) That a low maximum rate should be fixed for war risk premiums, and that the State should declare its willingness both in war and peace to accept risks at this rate.

98. The one point common to all these suggestions was that some sum should be levied directly from the interests concerned in the supply of the British Isles in time of war. They differed as regards the amount of the premium, the method by which it should be collected, and the question whether the tax should be leviable in peace as well as in war.

99. With regard to No. (1), viz. :—That the State should in time of war underwrite all the war risks of shipping, the main arguments urged in favour of it seem to be that, as the State would not seek to make a profit, the premiums asked might be lower than those in the open market by at least that part of them which represents the profit of underwriters ; and further, that as the State is possessed of a longer purse than either companies or individuals, it can face the prospect of a run of ill-luck with comparative equanimity, and the premiums asked may fairly be based upon the average rate of capture anticipated for the war as a whole, taking good times and bad times together, provided always, and this is an essential condition of such schemes, that the whole business of war insurance is reserved to the State and private insurance of war risks is forbidden by law.

100. In these conditions, it is argued, the premium might be set at a lower rate than would be asked in the open market, while, theoretically, the correct rate would be an amount whose total at the end of the war would exactly counter-balance the demands that would be made on the State for the indemnification of losses.

101. The criticism of any scheme of State insurance on these lines was in our opinion destructive.

102. Direct insurance by the State was condemned as unworkable, owing to the absence of the necessary machinery. An expensive department would have to be formed, and kept up so as to be as "ready to undertake its operations on the threat of war as our Navy is," and Government agents would be required all over the world, since the work to be done might be equal to the ordinary peace work of Lloyd's and all the insurance companies put together.

Lemon, q. 1037
Owen, q. 2261
Gow, q. 2619
Toomey, qs. 4745, 4749, 4657

103. Again, if the State tried to charge a premium the men employed to set the rate would tend to make it too low, because "none of the ordinary methods that govern a business man would operate in such a case," they would wish to oblige their friends, and there would be great justification for their doing so, because the object of the rate would be to encourage ships to sail.

Wright, q. 2006

104. Outside insurance would have to be forbidden, and there would be immense difficulty in preventing it. If it were allowed, then, as soon as the State rate was fixed the underwriters would try to undercut it, with the result that the State would "get all the bad risks, and the underwriters . . . all the good ones," while the consumer would have to pay not only the indemnity but the enhanced prices resulting from captures as well. The unfairness of this arrangement was commented on, and it was also pointed out that unless the premium could absolutely be adjusted it might happen that British shipping would be handicapped as compared with neutrals, and

Wright, qs. 2101, 2103
Boulton, q. 1629
Gow, q. 2554
Strachey, q. 4980

Harris, q. 534

that it would tend to drive British shipping to neutrals. The opinion of the Chairman of the Liverpool Underwriters' Association was expressed as follows:—"We do not see how any Committee. . . is going to fix premiums and assess values, and pay claims, with what shipowners would understand to be promptness, without at the same time admitting a great deal that is improper, and possibly even fraudulent."

Binning, q. 1781

105. The above considerations apply to the insurance of ships, but they apply with ten times the force when the insurance of cargoes is concerned. As Mr. Owen said, "If you think of what a ship brings: take one of these ships bringing 10,000 or 20,000 tons of cargo, split up amongst 200 or 2,000 different consignments, each of those 200 consignments, or whatever number there may be, having to be separately insured; if you think of all those to be dealt with in one office, all the ships coming from all parts of the world, thousands of people coming to insure, you would not have an office large enough to hold the people coming in. A man would sit there all day and all night, and not be able to see the underwriter. As it is, if you go to Lloyd's, and want to see an underwriter who is doing a big business, you see a regular queue of people waiting to call on him with their slips. You would want a place like the Albert Hall, and underwriters sitting all round it."

Owen, q. 2265

106. With regard to No. (2), three schemes were suggested to us for payments which were coupled with the imposition of special taxes intended to create the fund out of which compensation should be paid.

107. These were Mr. Owen's scheme, the scheme prepared in the Intelligence Department of the Admiralty and put forward in evidence by Captain Jones, R.N., and Mr. Beck's scheme. All three are printed as Appendices, and a memorandum by Captain Sir Charles Ottley, R.N. (a member of our Committee), is attached to the second of these schemes.

Owen, Appendix

108. Mr. Owen suggested the revival of the navigation laws, a tax on British goods exported by neutral ships, and the prohibition of the sale of ships to neutrals. In addition, he recommended an annual registration tax on all ships enrolled on a list of those qualified to enjoy the benefits of a State guarantee in time of war.

109. Captain Jones' scheme provided for the payment of the cost of the indemnity by the levy of a tonnage tax, or by dues levied on British and neutral shipping on the analogy of Pitt's Convoy Act of 1798, and suggested that payment should be made only where the minor war risks (demurrage, detention, etc.) had been insured in the open market, the object being to reduce the cost of Administration, to enlist the assistance of the underwriters on behalf of the Government in decisions as to values on which indemnity should be paid, and to prevent fraud.

On the other hand, Mr. Beck suggested that ships on certain permitted routes should be made to pay 1 per cent. of the value of hull and cargo on arrival.

110. We do not think that it is necessary, in view of what we have said already on the subject of insurance, and of what follows on the subject of a registration tax, to discuss these schemes more fully here.

111. With regard to No. (3), viz.: that a registration fee should be levied which should qualify for compensation for loss in time of war, it is to be remarked that the lower the fee the nearer the approach to indemnity, and the higher the fee the nearer it approaches to insurance. The registration or qualification fees suggested were always small in themselves, and were applicable in peace as well as in war. It was only in their cumulative aspect that the fees became large and approached insurance. The special advantage claimed for this form of insurance is that it would enable "values" to be settled in time of peace, so that there could be no question on this account in time of war. This no doubt would be a very great advantage. But it would also mean the maintenance of a large staff of skilled valuers in time of peace, and, as will be seen later on (par. 194), our opinion is that it would be a more satisfactory arrangement, and entail less expense upon the public purse in the end, to

pay on values that were estimated by competent persons after loss. A registration fee would necessitate the annual valuation or revaluation of all the vessels on the British register, which in our opinion would be more costly to the country than the risk of paying somewhat inflated values on what we hope may be the small number of captures to be anticipated in time of war.

112. It is to be noted that schemes in this category would apply to ships only. No method has been suggested to us by which they could be applied to cargoes.

113. Thus, on the assumption that shipping was charged 5s. per cent., it was calculated that the 18,000,000 tons (including coasting and sailing vessels) on the British register, valued at £10 a ton would produce £450,000 a year, and the Government would be in funds to the extent of well over £11,000,000 after a peace lasting 25 years. It was admitted by a shipowner that he might afford 2s. 6d. per cent. as a registration or qualification fee in time of peace, but he declared that it would be impossible for him to distribute any considerable addition in the form of increased freights, and added that there would be much opposition if more than a nominal contribution was demanded. Even at 2s. 6d. per cent., the charge on some of the large lines would amount to a serious addition to their working costs; and if such a tax had been imposed at the beginning of the Napoleonic wars, shipowners might have paid it for a century without obtaining any direct benefit from it. The opinion of another shipowner was that "economically" perhaps shipowners could afford to pay something, but "everything they pay would do more damage either to the country itself or to British shipping than the good that the country would obtain from such a payment." And, further, "a very small handicap very often means a tremendous change in the centre of gravity of trade," and might possibly cause a transfer of British ships to the Indian or Colonial register in order to avoid payment. Mr. Owen in his scheme suggested an annual fee of £3 for each 1,000 tons or fractional part of 1,000 tons gross. Sir Thomas Sutherland feared that any scheme for payments in time of peace as well as war "would mean, I suppose, imposing a heavy burthen upon the shipowning community, and I do not think such a scheme would ever have a chance of going through Parliament." While Mr. Mitcalfe of the North of England Protecting and Indemnity Association, asked, "why should a shipowner pay the 2s. 6d. when he can come to us and get covered without any such scheme during peace."

Brightman, q. 3185
Owen, Appendix
Sutherland, q. 4262
Mitcalfe, q. 4342

114. The sub-division No. 4 is represented by Sir George Clarke's scheme, which deserves fuller consideration.

This scheme suggests provision for State insurance through the agency of underwriters at fixed premiums, the standard of which can be lowered but not increased, and distributed by sections over the great trade routes to and from this country.

To quote Sir George Clarke's own words:—"The only justification for any form of National Guarantee of the war risks of shipping and cargoes, is the strong presumption that excessive or violently fluctuating insurance rates might have disastrous effects upon the shipping and mercantile interests, and through them upon the nation at large." The reasons which led him to prefer a scheme of purchased indemnity to a scheme of gratuitous indemnity are explained by him to be:—(1) The prevention of the over-statement of values which he feared under a gratuitous scheme. (2) The want of elasticity in a gratuitous scheme. (3) The fact that in war time freights would rule high, and that shipowners and merchants could afford to pay towards the cost of a scheme which worked for their special benefit. (4) The gross injustice involved in expecting the general public to pay for the protection of one particular industry.

Par. 7
Par. 15
Par. 15
Par. 17

115. In Sir George Clarke's opinion a material rise in war risk premiums would not check maritime operations, and in principle he thought there was no valid objection to a limited *ad valorem* contribution levied on shipping and cargoes. But he felt that the magnitude and the multitude of the transactions involved would make it impossible for any Government department to cope with them successfully, and that any scheme to be practical must be settled before the outbreak of war.

Par. 18
Par. 19

116. He proposed, therefore, that the State in time of peace should lay down a schedule of rates corresponding to zones of voyages, and should empower established insurance offices and underwriters to issue policies on behalf of the Government on commission.

He suggested a schedule of rates on the following lines as an illustration or model of what such a system would require :—

		Per cent.
(*a*)	Vessels crossing the English Channel or North Sea	$\frac{1}{2}$
(*b*)	Vessels entering the Baltic	1
(*c*)	Vessels passing through the English Channel	$\frac{3}{4}$
(*d*)	Vessels passing through the Irish Channel	$\frac{1}{4}$
(*e*)	Entrance of English or Irish Channel to Gibraltar	$\frac{3}{4}$
(*f*)	Mediterranean	$\frac{1}{2}$
(*g*)	Entrance of Channels to Cape or South America	1
(*h*)	Entrance of Channels to North America or West Indies	1
(*i*)	Suez or the Cape to Australia or the East	$\frac{1}{2}$

Under this schedule a vessel and cargo proceeding from London to Australia would be charged $\frac{3}{4}+\frac{3}{4}+\frac{1}{2}+\frac{1}{2}=2\frac{1}{2}$ per cent. viâ the Suez Canal, or $\frac{3}{4}+1+\frac{1}{2}=2\frac{1}{4}$ per cent. viâ the Cape. Admiralty control of the movements of the mercantile marine was stated to be as necessary under this scheme as under one of free indemnity.

Par. 28

In cross-examination the attention of witnesses was especially directed to this scheme, and their opinions are summarised below.

Harris, q. 648–51
Harris, q. 629

117. Mr. Leverton Harris admitted that British shipping might pay a premium calculated to counteract the bounty which a gratuitous indemnity would give it, but he thought that insurance by compartments would be unworkable.

Roberts, q. 954
Roberts, q. 948

Mr. Roberts (an underwriter) thought that it would be quite possible for underwriters to act as agents of the Government on commission. He said that if the State had a fixed schedule for particular routes, underwriters would still undercut whenever they wished.

Beck, q. 1309

Mr. Beck (an underwriter) held that underwriters would probably refuse to undertake the work.

Boulton, q. 1729*

Mr. Boulton's opinion was that there would be great difficulty in handing over premium forms to underwriting firms and asking them to complete the transaction on behalf of the State, and added that as a business arrangement, he would not himself entrust "a power of that sort" into the hands of firms that he knew very little about,

Boulton, q. 1730*

since it would be giving over the whole risk "to people who are not going to run any risk themselves."

Binning, q. 1937

Mr. Binning, on the other hand, considered that if the schedule of rates was fixed in a clear form, it might be arranged that all the actual business of insurance could be carried on by underwriters acting on behalf of the Government ; and thought that a scheme of this kind might be effective during the critical period just before and just

Binning, q. 1930

after the declaration of war, but that afterwards natural methods would assert themselves.

Gow, q. 2554
Gow, q. 2573
Gow, q. 2562
Gow, qs 2614, 2618.

Mr. Gow said that a fixed rate might either be grossly inadequate or grossly exaggerated. In the one case, the State would be greatly underpaid for the risk it was running ; in the other case, it might be overcharging for it. He thought that if it could be properly worked a scheme of purchased indemnity might have a steadying influence, that it would be more economical than gratuitous indemnity, and that people would be more careful if they had to pay something than if the scheme were gratuitous. But he felt that it would be difficult to find underwriters to act for the Government on the outbreak of war, when they would all be very busy themselves.

Bolton, qs 2881, 2883.

Mr. Bolton thought that the actual working of the scheme would be very difficult, even though it were made mechanical as far as possible by the establishment of zone rates.

Sir Robert Giffen was "not at all opposed" to a Government system of insurance at fixed rates varying with different journeys; and thought that it might have a steadying effect at the beginning of hostilities, even though "you could hardly do very much by special expedients" of this kind. He considered that trade would be able to bear maximum rates on the longest zone amounting altogether to 2½ per cent. Giffen, q. 3094 Giffen, q. 3098 Giffen, q. 3097 Giffen, q. 3095

Mr. Brightman and Mr. Maclay (both shipowners) said that this scheme was preferable to nothing, and would be practicable; and Mr. Toomey (a banker) thought that rates variable below a fixed maximum as suggested would be satisfactory to the trading community. Brightman, q. 3355 Maclay, q. 4141, 3 Toomey, q. 4665

Mr. Strachey, while admitting that the scheme would have good results, and would be very much better than nothing, felt that "if the Government was going as far as that, it would be simpler to assume the whole risk." q. 4777 Strachey, q. 4991

118. Lord Balfour referred us to Mr. Wilding's scheme of State Insurance, which had been brought before the Royal Commission on Food Supplies in Time of War. Balfour, q. 11

This scheme is simpler than the foregoing, and shows, perhaps, more clearly than Sir George Clarke's the principle that lies behind all schemes of purchased Indemnity, viz., that the State only becomes concerned, on behalf of the community, in the rates charged for war insurance when the increase is such as to have a marked effect upon the prices charged to the consumer.

Hence Mr. Wilding suggests a single rate per cent. for all ventures, which has no reference, either actual or implied, to the particular risks to be faced; but is fixed at the point beyond which insurance rates cannot, in Mr. Wilding's opinion, rise without causing an injurious increase in the price of commodities. Mr. Wilding placed this point at 5 per cent. The precise figure which ought to be chosen for the purpose is obviously incapable of exact determination. Different minds will fix it at different levels, and it is probable that a rate which, under one set of circumstances, would have no appreciable effect on prices, might, under different conditions, prove unduly high.

It will be seen that many of the same objections may be urged against this proposal as were brought against Sir George Clarke's scheme.

119. As already stated, there is, in our opinion, no reason of abstract justice why shipowners and cargo-owners who would find themselves specially favoured under a system of State guarantee should not be expected to contribute towards its cost. But after reviewing the schemes that were brought before us, and the criticisms that were passed upon them, we are unable to recommend any of them for acceptance. They must be judged not only by their theoretical justice but by their expediency and practicability and by the measure of approval which they would be likely to elicit from those most directly interested.

On all these grounds they appear to us to fail.

120. It might be practicable to levy a tax upon shipping in time of peace, but we cannot regard it as expedient in view of the general objections that any tax would *pro tanto* affect our power to maintain our existing trade in competition with neutrals, and that it would be paid unwillingly, or might even result in the transfer of ships from British to Colonial or foreign registers in order to escape the burden. The staff required to fix values, and accept payments in time of peace, would be both large and expensive, and would make a heavy inroad on the proceeds of the tax, whilst we find it impossible to name a sum that would be likely to be acceptable to Parliament, and at the same time reasonably sufficient for the creation of an adequate compensation fund out of which to pay for losses.

121. The difficulties in the way of taxation of cargoes in time of peace are even greater, and seem to us to be insurmountable.

122. We are therefore of opinion that the levy of contributions in time of peace towards a scheme of State Insurance in time of war is not practicable.

123. With regard to payments derived from special taxes levied on shipping in time of war only, the same difficulties confront us to a large extent. But the schemes propounded for this purpose are not confined to a simple indemnity. They raise large questions of fiscal and trade policy, which it is not within our province to decide. The evidence given before us does not however lead us to suppose that they would be generally accepted by the mercantile and shipping community, and it is to be observed that if the proposed taxes were confined to British shipping, they must tend to defeat *pro tanto* one of the purposes of a National Guarantee by imposing a special charge on our own shipowners, from which their neutral rivals would be free; whilst if the taxes were applied generally to all shipping visiting our ports, whether British or foreign, they must tend to raise the cost of the imported articles and so defeat the other object of a State scheme, namely the cheap supply of food and raw material.

124. There only remains for consideration the scheme set before us by Sir George Clarke, and described in a preceding paragraph, and more fully in his memorandum.

125. This scheme is avowedly a compromise between a free indemnity and an ordinary insurance. Its object is to prevent rates rising to a point at which either trade must become unremunerative or prices of commodities become oppressive. Rates are to be fixed beforehand and are to be open to acceptance at any time by merchants or shipowners; but no compulsion is to be exercised, and, as long as open market rates are lower than those of the State, the insurer will naturally do his business there rather than with the State. It is only when the State rate is lower than the market estimate of the risk that the offer of the State will be accepted, and the fixing of the State rates will be an arbitrary operation for which under the circumstances it will be difficult to provide any stable foundation.

126. We do not think that such a scheme stands any chance of acceptance or would meet with public approval. It was evidently difficult of comprehension and strange to all the witnesses who came before us. Some of them indeed said that it would be better than nothing, but these generally thought that the amount which would be received by the State would not be commensurate with the trouble it involved, and they preferred a free indemnity. It was commonly met with the objection that it would leave the State with all the bad risks and the market with all the good ones, and no method was suggested to us for applying it to cargoes or for adjusting it to the many and varied cases presented by the activities of our mercantile marine. Great inconsistencies appear to us inseparable from the scheme, which besides involves an amount of administrative detail that would probably be fatal to success and pre-supposes a hearty and universal co-operation on the part of underwriters, which the evidence before us gives us no sufficient reason for anticipating. The risks on the several routes would vary from time to time during a war, and such variations might be sudden and violent. This consideration by itself appears to constitute a formidable objection to any such scheme.

127. Even if we admit the possibility of obtaining contributions from the direct beneficiaries we feel so strongly the immense difficulties in the way of State action that we cannot recommend the extension of the State's activities in this direction. Those conversant with the high standard of accuracy and attention to precedent demanded from a Government department, and the instant challenge from the public if there is any apparent inequality of treatment, will appreciate the impossibility of expecting successful results from a department that would have to be created, or at any rate very largely extended, at a moment when everyone concerned would be working at extreme pressure.

128. We arrive therefore at the conclusion that the idea of contributory schemes must be abandoned, and that it would be necessary that a National Guarantee, if given at all, should take the form of a free Indemnity to our national shipping and maritime trade.

Cost of a National Indemnity.

129. The estimates of the probable cost of a guarantee were very divergent. They are summarised in the Appendix, and we do not therefore think it necessary to discuss the figures here, for even if the total values at risk could be satisfactorily determined, there remains the question of the proportion of losses to be expected. The answer to this question is a matter of pure speculation. It must obviously vary with the circumstances of each particular war, with the geographical position and naval strength of the enemy or enemies to whom we may be opposed and with the state of preparedness and efficiency of our own fleet. We have been referred more than once to the experience of the great French war; but there seems to be some doubt as to the actual figures of *bonâ fide* losses in that contest since some of the cargoes reported as captured were probably deliberately thrown into the enemy's hands to evade the Berlin Decrees and the Orders in Council. But, even if trustworthy figures were obtainable, the conditions both of naval warfare and maritime commerce have been so completely revolutionised in the intervening years that we do not think it safe to found upon them any calculations for the future.

130. We confine ourselves therefore to stating that in our opinion the initial losses may be large, and though in the course of prolonged operations a condition of much greater security would probably be established as the war proceeded and our naval superiority made itself felt, the aggregate might nevertheless be considerable. It would be for the Chancellor of the Exchequer to consider whether he could afford to assume this additional burden, falling as it would at a time when the national resources were exposed to the tremendous financial strain of a great war.

Incidence of the Cost.

131. But whatever the cost to the Nation of a scheme of National Indemnity, it was argued by some of the witnesses that it would be both less in amount and more fairly distributed if it were assumed directly by the State than if it were left to find its way to the consumers through the ordinary channel of trade. Thus Lord Balfour held that the consumer would ultimately have to pay in one form or another all the additional charge for war insurance on what he consumed; that in this matter the consumer and taxpayer were convertible terms; and that it was "better to put it (the cost) on the taxes rather than to leave the individual consumer to pay it as best he can." Balfour, q. 17

132. Mr. Bowles on the other hand combated the idea that it was fairer for the State to bear the whole of the losses than that they should be divided among all the possible losers. He pointed out that the State in this case meant the taxpayer, who was not necessarily the same person as the shipowner, cargo owner, or final consumer. His contention was that the proper person to bear the cost of indemnity was the final consumer of the goods imported, since it was not fair that the consumer of corn should pay for "ostrich feathers, nor the consumer of ostrich feathers for corn." He feared that under an indemnity it would "no longer be the loss of the consumer, or of the man who is interested in the goods—but . . . everybody's loss . . . So that it would be a transfer of the loss from the person who now (*i.e.*, under ordinary insurance) suffers it to the taxpayer at large," which he conceived to be a "very great and wanton injustice." He also feared that a gratuitous indemnity might impose an extra burden on the poor which had hitherto been borne by the consumer of the particular article. And he declared against any such scheme, saying that it would in effect "lump the £190,000,000 worth of food together with the £146,000,000 worth of raw material, and the £191,000,000 worth of luxuries and other articles not of prime necessity, and then clap upon the taxpayer the cost of all that may be captured." Bowles, q. 102 Bowles, q. 116 Bowles, q. 113

133. It is true that some of the witnesses thought a distinction might be made between necessaries, or at any rate articles of general utility, and luxuries, and that the guarantee should be confined to the former. But the majority, even when of opinion that such a distinction was theoretically justified, held that it would in practice be found unworkable and would not in any case be worth the trouble and difficulty which it would cause. Bowles, q. 84 Boulton, q. 155 Jones, q. 256 Balfour, q. 18 Bolton, q. 2785 Miller, q. 3380 Hill, q. 3663 McArthur, qs. 4489–91 Strachey, q. 49

134. Mr. Nugent called attention to a somewhat different aspect of the same question and from another standpoint was equally of opinion that losses in war time would be better distributed among the people who insure the risks than they would be through the agency of the Imperial Exchequer, his feeling being that "the issue of Government stock has a greater effect in depressing all existing securities than the sales of moderate amounts by bankers and others." He pointed to the comparative ease with which the losses due to the San Francisco earthquake were met, and said that the disturbance would have been far greater if it had been necessary for Government suddenly to raise the same amount from the market.

Nugent, q. 3610

Nugent, q. 3568

135. It must be admitted that a National Indemnity would transfer to the taxpayers at large a liability which is now borne by the individuals immediately concerned, subject to their power of subsequently distributing their losses among the general body of consumers through the medium of enhanced freights and prices. The general community, who under any scheme of indemnity would thus directly bear the losses incurred by shipowners, merchants and underwriters, would, on the other hand, have no direct share in the increased profits which successful ventures would secure, and which are the natural compensation for increased risks. They would have only the most shadowy control, through the Admiralty, over the nature of the ventures which might be undertaken and the extent and character of the risks run. And they would themselves be in many cases great losers by the fall in securities, the disturbance of the money and labour markets, etc., which would be the inevitable accompaniment of a great war.

136. Nothing but the clearest national advantage could justify such a transfer of individual liabilities to the community at large. How far such advantage can, in our opinion, be said to exist has already been discussed, and our conclusions have been indicated in Part I. of this Report. They are further and finally dealt with in the summary with which the Report concludes.

The Effect of a National Indemnity upon the Reputed Ownership of Goods.

137. It was argued before us that one of the immediate effects of a scheme of National Indemnity would be to transfer the apparent ownership of all goods shipped in British bottoms to British nationality, and that the cost of an Indemnity would thereby be unwarrantably increased.

138. In Lord Balfour's opinion the question of ownership under an Indemnity was an important and complicated point. He said that the ownership of goods consigned to a British merchant was probably British, and, therefore, being the property of a belligerent, would be liable to capture by the enemy. On the other hand, goods in the course of export were the property of the person to whom they were consigned, presumably a neutral, and therefore would not be liable to capture.

Balfour, q. 18

139. Others, however, held that a free indemnity would probably result in foreign cargoes being transferred to British ownership at their port of loading, instead of remaining under foreign ownership until they came to their port of landing.

Beck, q. 1270

140. On the other hand, Mr. Bolton was of opinion that a great blow would be dealt to the shipping trade if foreign-owned cargoes in British bottoms were not indemnified, and other witnesses concurred in the view that it would be necessary to extend the guarantee to foreign shippers, because they would not ship by British vessels if they were not covered. In commenting on the difficulty of determining ownership, Mr. Leverton Harris said that if goods in a foreign name on board a British vessel were found to be at a disadvantage as compared with British goods, "you would find that all the goods went automatically into a British name." He thought that the House of Commons would object to the indemnification of foreigners and would try to exclude them; but that it would be found "when the actual event occurred there would be no foreigners."

Bolton, q. 2679

Harris, q 683

Harris, q. 690

141. This transference in ownership was also urged as a strong argument against any scheme of indemnity. It was said that trade would be paralysed if any attempt

were made to go behind the endorsed documents which in commerce were accepted as the mark of ownership; but that if they were accepted, it might happen that the enemy would be subsidized. Thus, on the assumption of a war with Germany, Mr. Wright considered that it would be possible for a German house to instruct its branch in Argentina to ship grain in a British bottom to England, and to effect the insurance in the name of an English firm. The bills of lading would be handed to the English firm, who would pay for the cargo. The Germans might capture the ship, the loss would be duly collected, and the enemy would have the cargo as well as the payments in respect of its capital value. Wright, q. 2003

142. The evidence on this head appears to point to a real difficulty. We agree with Mr. Leverton Harris that if an attempt were made to distinguish between British and foreign owned goods in British bottoms, it would break down and all goods shipped in such vessels would appear in British names. Goods which if owned by neutrals would not be liable to capture might thus be transferred to British ownership before instead of after the sea risk, and might become good prize, thus lessening instead of increasing the security of supplies and placing an additional and unnecessary burden on British finance.

The Possible Effect of a Scheme of National Indemnity upon Prize Courts.

143. Mr. Bowles was the only witness who dealt directly with this point, but it is one that deserves serious consideration.

144. Under present circumstances, the neutral owner of a cargo unjustifiably condemned fights for restitution before the Prize Court of the captor, and uses whatever influence he can bring to bear on his own Government to support his claims. Under an indemnity or insurance by the State, owners or underwriters would have less inducement to urge their claims vigorously; they would know that the State would pay if the cargo were condemned, and they would naturally prefer to rely on the guarantee of the British Government rather than prosecute their claims, at considerable expense to themselves and with at best complete uncertainty as to the result, before the Prize Courts of the enemy. On the other hand these Prize Courts could not but be influenced by the knowledge that whenever such a cargo was condemned the loss fell not upon the neutral individual but directly on the enemy State and the temptation to decree wholesale condemnations would be very great. Bowles, q. 122–3 Beck, q. 1273

145. Though not by itself conclusive of the whole question, this appears to us to be, as far as it goes, a valid objection to any scheme that can be devised. We are of opinion that the existence of an indemnity must tend to lessen the incentive to neutral owners of property captured in British ships to seek recovery through the enemy's courts, and would to that extent increase, without any compensating advantage, the charges on the National Exchequer.

The Need for, and Effect of Admiralty Control.

146. The necessity for vesting in the Admiralty a general control of the movements of shipping under any scheme of State Guarantee was generally admitted, and we refer below to some special points to which our attention was directed. Jones, q. 386 Brightman, q. 3187 Miller, q. 3506 Hill, q. 3668 Jeans, q. 4172 Mitcalfe, q. 4341

147. In Lord Balfour's opinion the control of the Admiralty ought to be made very stringent, and compliance with its instructions should be made a condition of indemnity. Balfour, q. 23–4

148. Sir Robert Giffen said that Admiralty directions would have to be followed exactly, and could not conceive of any working scheme in which the shipowner would be at liberty to do as he liked. But he admitted that there would be many difficulties in the maintenance of a satisfactory control, and was inclined to think that indemnity should not be given on routes such as the voyages between Dover and Calais, Liverpool and Belfast, or the Red Sea, or the Mediterranean, in which there could be no medium between absolute safety at one time, and practical certainty of capture at another. Giffen, q. 3100 Giffen, q. 3040–1 Giffen, q. 3033.

Harris, q. 554
Beck, q. 1395

Similarly Mr. Leverton Harris thought that the State should refuse liability altogether in particularly dangerous areas, and Mr. Beck added that the Admiralty should have the right not only to control, but to insist on the abandonment of a voyage at any given point.

Bowles, q. 136
Lemon, q. 1056
Sutherland, q. 4260
Mc Arthur, q. 4580

149. On the other hand, it was urged that the complications and exigencies of modern trade were such that it would be impossible for the mercantile marine to submit to Admiralty regulations; that control of this kind might even endanger the safety of ships by depriving shipowners of their initiative; and finally that the stipulations of the Admiralty might be so irksome as to render any State scheme nugatory. Mr. McArthur pointed out that if control were stringent, the rates charged on marine risks would be increased, because there would be a possibility of the Admiralty giving orders for vessels to go out of the ordinary course of navigation or to put into an unusual port of call.

150. In our opinion it would be impossible for the State to accept the obligations of a National Guarantee without insisting that all vessels enjoying the Guarantee must submit to such restrictions and directions as the Board of Admiralty might from time to time prescribe. No doubt these directions and restrictions would be made as little onerous as possible, and in many cases, though not in all, would amount to little more than the advice which the Admiralty would tender, and shipowners would gladly follow, if no guarantee were in existence. But they would inevitably involve considerable interference with the ordinary channels of trade, and their obligatory character would almost certainly be resented. Their wisdom and necessity must necessarily be matter of opinion at the time they are issued, and experience might sometimes show them to have been ill-advised; whilst the fact that the State Guarantee was dependent on exact obedience to them might destroy the initiative and enterprise of captains and masters of vessels in sudden emergencies just as the certainty of indemnity might tend to weaken the existing inducements to use every effort to escape capture.

The Danger of Fraud.

Bowles, qs. 145, 147

151. The danger of fraud was brought before us on many occasions. There is no absolute security against fraud under the present method of insurance, but many witnesses expressed the fear that if the State were to undertake responsibility for losses, the proportion of captures and losses would be largely increased.

Beck, q. 1266
Bowles, q. 102
Beck, q. 1238
Bowles, q. 100

152. It was alleged that one of the lessons learnt by underwriters during the Russo-Japanese war was that capture by the enemy would be looked upon as a very useful market by owners, and must be guarded against. It was said that if a shipowner wanted to be sure of "making a good thing," the only certainty of it was to incur a total loss; and one witness stated that, in his opinion, an indemnity would act as a stimulus to shipowners "not in the pursuit of carriage, but in the pursuit of captors for their ships."

Bowles q. 135

153. The same witness feared that an indemnity, "like the rain, would fall equally upon the just and the unjust—upon the wise and the foolish." He thought that such cases as that of the ship specially indemnified by the Spanish Government, which is alleged to have steamed straight into the enemy's arms at Santiago, would not be wholly unknown; and that "the proportion of losses by capture, when encouraged by a certainty of full compensation, would be greater than if there were no such certainty . . . The risk to the State would be unknown. It would certainly be very great—it might be tremendous."

154. Other instances, not necessarily of fraud, but illustrative of the difficulties which would arise, were brought to our notice. Thus we were told of an owner of high standing, who at the time of the Spanish-American war had three ships sailing under the Spanish flag to the West Indies. Two of the ships were obsolete, and one was modern. All three were insured at the same rate per cent. The two old ships were sent to sea and were captured, while the modern vessel was kept out of harm's way. Fraud was not alleged in this case, but the witness drew from his experience

the conclusion that the numbers of "prudent" shipowners would probably be augmented under an indemnity. Binning, q. 1805

155. Even those who were strongly in favour of a scheme admitted that the dangers were so great that the State would be cheated if any scheme were attempted without the aid of skilled underwriters, and that the admission of foreign cargoes carried by British ships would lend itself to fraud, because of the impracticability of any satisfactory control. Owen, q. 2370 Maclay, q. 4037

156. Mr. Estall, a banker, said that in his opinion there would be "a great deal of fraud, of course," under an indemnity, because everyone was apt to consider the Government "fair game"; that invoices might be loaded and that in the case of captured wheat it might have been "weevil wheat, or bad wheat, or no wheat. You might pay for wheat, or you might not. There would be a tremendous opening for fraud." He feared that even with expert assistance the Government would not be able to compete with the tried machinery of Lloyd's. Estall, q. 3855 Estall, q. 3872 Estall, q. 3856 Estall, qs. 3888–9

157. In defence of the present system it was urged that the payment of a substantial premium was a deterrent to the fraudulent, because an owner was unable to face the possibility of the safe arrival of worthless goods which he had insured at a fancy value. Others were of opinion, in spite of the admission that there are a "certain class of men" who, "when they are very well insured, are absolutely reckless as to what becomes of their property," that the danger of "bogus" cargoes was more imaginary than real, because the shipowner would have to be a party to the swindle to make any fraud effective. And one witness held that the Government would run even less risk than underwriters, because the Government would prosecute the fraudulent, whereas the custom among underwriters was to pay where there was any doubt, and to meet fraud by refusing to insure a second time. Wright, q. 1996 Boulton, q. 1519 Lemon, q. 1077 Boulton, q. 1601 Jeans, qs. 4189–90

158. Mr. McArthur admitted that the *bona fides* of owners would have to be generally accepted, but added that under any State scheme the fundamental principle of the law of insurance, viz., that fraud vitiates the guarantee, would certainly be maintained. McArthur, qs. 4521, 4546

159. The danger of the over valuation of both cargoes and ships, is more particularly discussed in paragraphs 173–195. It is sufficient to say here that "values" would require most careful investigation before acceptance. The difficulties to be expected may be illustrated by reference to the case of the recent Atlantic combination, to which Mr. Bowles drew our attention. In this case an aggregate of over a million tons of British shipping was acquired, and capitalised at £39,000,000. The ships were allowed to retain their character as British vessels, and would be capturable by an enemy at war with Great Britain. Mr. Bowles considered that the ships had in fact ceased to be British owned, and he regarded the £39,000,000 as a gross over-valuation; but he presumed that the Government would be expected to pay on this amount in the event of capture, and added that, if this were so, there would be great temptation to other neutrals to purchase our shipping, and keep it under the British flag; and added that "the very enemy subject might do it." Bowles, q. 120

160. It is difficult to resist the conclusion that fraud would be both easier and more lucrative under a scheme of National Guarantee than under the present system. The State would neither possess the knowledge nor could it exercise the discretion which are the chief safeguards of existing underwriters. The arbitrary decision by the State of disputed points would of course be contrary to the whole body of existing practice and custom, and would tend to shake confidence in the scheme as a whole. On the other hand to allow an appeal to the Courts in the case of all disputed valuations and suspected frauds would place the onus of proof upon the State, and it must we fear be admitted that the Treasury would not be "a popular litigant." At the same time it is difficult to see how the State could protect itself as an individual underwriter may do by refusing to entertain business introduced by anyone whose *bona fides* there is reason to suspect. Some further observations on this subject in connection with the Boards of Claims and the right of appeal will be found in paragraphs 196-205.

The Separation of Sea Risks and War Risks.

161. The argument here may be stated as follows:—It is said to be a general custom, though there are exceptions to the rule, to insure both sea risks and war risks with the same underwriters. It was agreed on all sides that it would be impossible for the State to undertake sea risks as well as war risks, and it was feared that if the State undertook the war risks, and the sea risks were left to the ordinary methods of insurance, there would be certain cases in which liability would be denied both by the State and the underwriters.

162. Where the shipowner has insured the two classes of risk with different underwriters, this difficulty already exists, but it was thought by some witnesses that the difficulty would be increased by any scheme of National guarantee. It was suggested that even though all marine risks were excluded from such a scheme, it would be very difficult in "a voyage policy on goods to know exactly what clauses to put in to cover" marine risk due to deviation by order of the Admiralty. Deviation within limits is allowed now under a marine policy if a special clause is inserted to this effect, and extra payment made. But deviation in time of war might mean a still greater addition to the marine premium, and would in effect amount to a war risk insurance. As typical of the difficulty which might be caused by deviation owing to Admiralty orders we were given the case of a ship sent "north about" owing to danger in the Channel, and wrecked in the Pentland Firth. This would be a sea risk, and not a war risk, but, on the other hand, the marine risk in question would never have been taken but for the exigencies of war.

Hill, q. 3690
Hill, q. 3692–3
Hill, q. 3696
Balfour, q. 23

163. Three other instances were brought before us by Mr. Lemon as suggesting special difficulties:—(1) *Missing vessels.* Who could know whether such vessels came under the capture clause, or under an ordinary sea peril? (2) *Wreck by explosion.* Who would know whether a ship had been wrecked by ordinary explosion (a sea risk) or by a shot from the enemy (a war risk)? (3) *Vessels lost after capture.* Under which policy would a vessel that was seized as a prize and then lost by a sea peril be covered? The possibility of the destruction of vessels by marine mines might raise questions of even greater difficulty.

Lemon, qs. 1022, 1028

164. On the other hand we were told that the separation of sea and war risks was practicable, that it was common practice to separate them, and that the risk of falling between two stools though possible was small. Mr. Boulton explained that in time of peace it was the usual practice to take sea risks and war risks on the same policy, but that in time of war underwriters were sharply divided into two classes, viz., those who were willing to take war risks, and those who were unwilling to take them. He thought that questions under which policy loss should fall were always liable to arise, but that the difficulties of settlement in such cases were very much exaggerated.

Beck, q. 1483
Owen, q. 2211
Miller, q. 3524
Boulton, q. 1635

165. Mr. McArthur, in our opinion, fairly summed up the conditions that would have to obtain under any scheme of State indemnity, when he quoted the legal maxim that governs all policies of insurance at the present time, viz., "causa proxima non remota spectatur." In his opinion the marine underwriter would be liable for aggravation of the marine risks caused by the existence of hostilities, and the Government would only be liable for the immediate and direct effect of hostile acts. He quoted previous decisions in the law courts to show his meaning. Thus, during the American Civil War the lights of the Hatteras Lighthouse were extinguished by the Confederates, and in consequence a vessel went ashore and was lost. It was held that this was a loss by perils of the sea, and not by a hostile act. Again, in the case of a vessel injured by a shot from the enemy, which yet escaped, but subsequently met a storm and sank, it was held to be a loss by perils of the sea, even though the shot might have contributed to the foundering of the vessel. He admitted that where questions of fact were in doubt, decision would have to be made by arbitration.

McArthur, q. 4507
McArthur, q. 4555
McArthur, q 4556–7
McArthur, q. 4557*

166. In our opinion it cannot be denied that the division of sea risks and war risks under a scheme of National insurance or National indemnity would occasion some risk of dispute and difference of opinion. And we admit that the position of a

Balfour, q. 63

person insured against marine risk by a private company, and against war risk by the State, might be less good than the position of one who was covered for both risks by the same policy. But we think that this difficulty may easily be exaggerated, and that if on other grounds a National scheme were thought desirable, it would not be insuperable. The additional marine premium that would be charged owing to the aggravation of marine risks would probably not be a serious matter, and the extent of the State's liability would seem to be sufficiently defined by the interesting statement of recorded cases supplied to us by Mr. McArthur in the course of his evidence.

Lemon, q. 1020

McArthur, q. 4543

Difficulties of Administration.

167. What has been said in the preceding section is sufficient to indicate the great importance which attaches to the question of values and the method by which they are to be ascertained for the purposes of any National Guarantee. Indeed, the practicability of any scheme may be said to hinge largely on the solution of this question, for it is here that we are brought directly in contact with the administrative difficulties which beset the proposal in any form, and with the machinery required for its execution.

168. In the ordinary course of business the value on which compensation is to be paid is a value agreed beforehand between insurer and insured. The amount at risk and all the conditions of the venture are known and declared in the policy, and the terms of the policy itself have been the subject of frequent decisions of the Courts until their meaning is very accurately and exactly known to all the parties interested.

169. The daily work of issuing such policies is carried on by large numbers of companies and individuals with representatives at every port. Some idea of the amount of work involved may be gathered from the statement of an underwriter that in peace time from 50,000 to 100,000 policies are issued every day in London alone. It is obviously impossible, even if we take the lower figure, that a Government office without previous experience, with at best only the skeleton of an organisation in time of peace hastily expanded under great pressure when war became imminent, should attempt to issue individual policies for each risk guaranteed and to cope with the gigantic burden of work, much of it of a very technical character, of which the 50,000 or more daily policies of London are only a fraction.

Boulton, q. 1655

170. Lord Balfour of Burleigh did indeed offer it as his opinion that there would be no difficulty in "ordering the shipowner who wishes to join in the advantages of it (an indemnity scheme) to take out from the Government Department concerned what would correspond to a policy in the case of ordinary marine insurance; and, in doing it, he might be required to hand in all necessary papers to establish the value of his ship." But he does not appear to have had present to his mind when giving this answer the case of cargo, and it was not put to him. We think he underrated the difficulty in the case of ships, but the difficulty becomes an impossibility when any attempt is made to extend his plan to the innumerably greater number of cases which would arise in connection with cargo.

Balfour q. 25

171. Is it possible then to devise any plan which would render unnecessary the issue of policies or certificates by the State? In other words, can values be determined after loss has been incurred with sufficient accuracy to enable the State to dispense with any preliminary agreement or document and to concern itself only with that small proportion of the total number of ventures in which loss was proved to have been incurred by the risks and perils of war? And if the State can be so safeguarded, would the resulting arrangement give satisfaction to the commercial world and suffice to enable commerce to proceed uninterruptedly in its usual course?

172. It is to these questions that we now propose to address ourselves. Their importance, which had been evident to us from the first, appeared to increase rather than to diminish as our enquiry proceeded. Much of the evidence deals with them, but here, as elsewhere, it unfortunately revealed considerable difference of opinion among those most competent to form a judgment.

Values.

173. We take first the question of the determination of values. In our draft scheme "A" we had contemplated that a simple notification of intended sailing should be the only preliminary formality, and compliance with the Admiralty directions the only condition for the admission of a British ship and British cargo to the benefits of the indemnity. Values were to be determined only after a loss had occurred, and were to be :—

(*a*) The value of the ship at the time of capture ;

(*b*) The value of the cargo at the port of shipment plus insurance and freight to port of destination.

174. In reviewing the evidence it will be convenient to deal first with ships, and afterwards with cargoes.

175. As to (*a*) (*i.e.*, the valuation of ships)—

176. The principal points raised were the basis on which values should be estimated and the persons to whom the valuation should be entrusted. There was much difference of opinion with regard to the basis to be taken, and the views of witnesses on this point and on the difficulties in the way of a settlement that should be acceptable both to the State and to the possible beneficiaries under a scheme of indemnity are therefore stated with special fulness. Thus, Mr. Leverton Harris considered that the question of a valuation that would be fair to the State, to the shipowner, and to the cargo-owner, in case of loss, was the greatest difficulty involved in any scheme of National indemnity. It would be greater than that of fixing values for insurance purposes, because in an indemnity the State gave something without payment, whereas for the ordinary purposes of marine insurance the assured value of the ship was a matter of arrangement between the underwriter and the shipowner. In his opinion the value for which a vessel is ordinarily insured for marine risks would be no indication of the vessel's real value, since it was often "50 per cent." higher, and might be much lower. He said that the practice in peace time was for the shipowner to declare a low value in order to pay as little as possible in premium, whereas the underwriter encouraged over-statement of value up to the point at which "moral hazard" was reached in order to gain on the sum total paid as premium. He cited the case of a shipowner owning sister steamers, one of which had been very fortunate, and the other very unfortunate in her trading. The fortunate vessel would have had large sums written off her value, and might be insured for the comparatively small sum of £20,000, while the other would not have been written down, and might have been insured for £40,000, in order that the capital of the company should be kept intact in case of loss. Supposing that indemnity was paid on marine insurances, and both these vessels were captured, one would be able to claim only £20,000, while the other obtained £40,000, a difference which would lead to great complaints.

Harris, q. 536
Harris, q. 537
Harris, q. 654
Harris, q. 655
Gow, q. 2467
Harris, q. 537

177. Mr. Harris thought that the value to be taken should be the value at the commencement of war, and should be fixed before the sailing of the vessel in order that mortgagees should know how much they would receive in case of loss. He explained that mortgagees lend money on the value of the vessel and do not take trading risks, and might refuse to allow a vessel to sail unless they knew the extent to which they would be indemnified in case of loss.

Harris, q. 665
Harris, q. 677

178. With regard to valuation for the purposes of the State, Mr. Harris thought that there would be no difficulty in obtaining expert opinion from those whose business it was to sell or value steamers, which would be within 10 per cent. of the real value. He gave a week or two as the time required for making the necessary arrangements, but added that "in nine cases out of ten" this would not hinder business. He would have offices established for the purpose in London, Liverpool, Newcastle, and other places.

Harris, q. 656
Harris, qs. 670–1
Harris, q. 668

179. At least three of the underwriters who were examined were with Mr. Harris in thinking that the values insured against marine risks were an unsafe basis for payments under a State indemnity ; Mr. Boulton holding that if an owner wished to

Beck, q. 1314
Boulton, q. 1637

have his ship captured for the sake of indemnity he would increase the value insured against sea risk "to any extent," unchecked by the underwriters, who would know that this risk was of the slightest, and would profit by the premiums paid. In this way he might insure for many times the real value by paying a few shillings per cent. for the marine insurance on the chance of being given a war indemnity at the same figure. Owen, qs. 2383-4. Boulton, q. 1637

180. Others, of whom two were underwriters, thought that values for marine risks might safely be accepted, though it was suggested that a committee should be appointed to review and consider the values declared in case they should be excessive. Roberts, q. 966 Lemon, q. 1163 Brightman, qs. 3195–6

181. Mr. Lemon and Mr. McArthur feared that the question of values would lead to much contention, since shipowners who had suffered loss would say that it was not the money so much as their ships that they wanted, and would complain if they were not very fully indemnified; though in Mr. McArthur's opinion a committee or board would find no difficulty in fixing a fair value to be placed on a ship after hearing evidence. Mr. McArthur added, however, "whether that would satisfy the person guaranteed is quite another matter. My experience rather goes to show that it would not." Mitcalfe, q. 4354 Lemon q. 1061 McArthur, q. 4518 Lemon, q. 1065 McArthur, q. 4518

182. Mr. Owen contended that a shipowner should be entitled to more than he would obtain if his ship was sold, since the mere fact of the ship's loss involved him in other incidental losses. Thus he could not at once replace his lost ship, he would have to have one built, and meanwhile he would be without the earning power of the vessel. Owen, q. 2251

183. Mr. Bolton insisted that the basis of value should be settled in advance, and saw no serious difficulty in defining it. He said that shipowners would be satisfied with any reasonable basis if stated before the scheme came into operation. Shipping might be taken at the original cost to the existing owner, less a certain percentage per annum for depreciation calculated on the original cost of the ship. He thought that no transfer to fresh ownership within a given time previous to the outbreak of war should be recognised, so that excess values occasioned by the prospect of war should be avoided. Bolton, Appendix and q. 2737

184. Mr. Miller said that the Government should insist on an annual declaration of values from shipowners, with the object of preventing inflated values after war had broken out; though he admitted that it would not work fairly in every case. "You may have an old steamer which is written down in the books of the firm who own her to about as low a value as they can possibly write her, still she has a market value of some description, and if you sold her you might get a few thousand pounds for her in excess of the book price." In his opinion the scheme most acceptable to shipowners would be that which fixed the value when the ship was captured. Miller, qs. 3522, 3539 Miller, q. 3518 Miller, q. 3548

185. Mr. Maclay, a shipowner, said that "it would be the greatest mistake possible" to trouble at all about the value until the ship was lost. Maclay, q. 4072

186. Others favoured Mr. Bolton's suggestion of valuation at cost price, less depreciation at a fixed rate per annum, Mr. Hill saying that the advantage of taking cost as compared with value lay in the fact that it was capable of exact proof, whereas "value" must always be a matter of opinion. He thought that owners would not be entitled to consider themselves badly treated if compensation was based on the cost, less depreciation at 5 per cent. per annum, since few ships ran for more than twenty years; at the same time, he would leave them a certain latitude for covering any additional values at their own expense. Hill, q. 3704 Gow, q. 2586 Hill, q. 3707

187. But it must be admitted that values fixed on depreciation would be only a rough test, since a ship may be worth more than she has cost a few years after building, and, on the other hand, she may be worth only half her original cost. It was thought indeed that shipowners would not submit to such a condition; and again in time of war the market value of individual ships may rise considerably. Mitcalfe, q. 4442 Binning, q. 1820 Roberts, q. 890 Gow, q. 2447

188. Mr. Gow in order to overcome the difficulty of defining insured value for the

purpose of assessment after loss, said that the proper insured value to take was the insured value of the ship as defined by the Marine Insurance Act of 1906, rather than the value of the ship at time of capture. The object of the clause in this Act was to fix the value in case no value was agreed in the policy. It runs as follows: "In insurance on ship the insurable value is the value, at the commencement of the risk, of the ship, including her outfit, provisions and stores for the officers and crew, money advanced for seamen's wages, and other disbursements (if any) incurred to make the ship fit for the voyage or adventure contemplated by the policy, plus the charges of insurance upon the whole. The insurable value in the case of a steamship includes also the machinery, boilers, and coals and engine stores, if owned by the assured, and, in the case of a ship engaged in a special trade, the ordinary fittings requisite for that trade." Mr. Gow, however, admitted that considerable difficulty was experienced in arriving at the value under this clause.

Gow, qs. 2506–9

Gow, q 2512.

189. As to (*b*) (*i.e.*, the valuation of cargoes):—

Harris qs. 540, 1 Roberts, q. 890 Beck, q. 1312 McArthur, q. 4520

The valuation of cargoes was declared by several of the witnesses to be a more simple matter, since in all the great cargo trades prices are regulated by everyday quotations, and the invoices of purchase, and other shipping documents would be available.

190. The difficulties to be contended with appear to be:—(1) inflation of values, since, as one witness pointed out, "in these days of cables it would be known perfectly well" what the position was over here, and a very high value would be put on cargoes that were likely to be in danger of being captured; (2) the amount of departmental work that would be entailed in examining claims and making payments to the various distinct interests in any cargo; and (3) the question whether or no a reasonable profit should be allowed for in the indemnity.

Binning, q. 1870

Boulton, qs. 1528, 1532 Lemon, q. 1094 Boulton, q 1604

191. In the case of cargo it appears to be a very general practice to take the value at invoice cost, plus the freight and 10 per cent.; and Mr. Boulton thought that the "arrived" value, *i.e.*, the value with profit attached, should not be entitled to compensation, so that an owner should have an extra incentive to insure the arrival. He explained that an owner would expect to obtain, say, 100 per cent. profit provided the cargo arrived, whereas if it were lost he would only have 10 per cent.

Brightman, q. 3209 Hill, q. 3704 Harris, q. 542 Maclay, q. 4070 McArthur, q. 4522

192. In the opinion of Mr. Brightman and others it would be reasonable to take the value at the port of shipment, plus insurance and freight to port of destination, as the basis of value, and it was suggested that the amount paid for freight should be the freight at the shipowner's risk at the time of loss, minus the cost of earning it from that time.

193. Mr. Gow thought that this section might be made clearer by substituting after the word "shipment" the words "plus ordinary free of capture and seizure insurance" (*i.e.*, ordinary marine insurance) "and freight to port of destination so far as prepaid."

Gow, q. 2514

194. We think it results from the evidence that no simple rule of thumb is available for calculating ships' values. To take the prime cost of the ship less a fixed annual charge for depreciation would not be fair either to the State or the owner. For the reasons already given it would be equally unsafe to trust to the values declared for marine risks, and in any case this test would not be available in the case of companies and firms which are their own insurers. We have already expressed our conviction that to issue a policy in advance in each individual case for an agreed value is a physical impossibility, and we are driven to the conclusion that the only feasible plan is that foreshadowed in Scheme A—namely, to define as accurately as may be the basis on which values are to be calculated, and to leave the application of these general rules in particular cases to be settled by an expert board or boards sitting in the principal ports, to whom would be entrusted the duty of deciding on the amount payable wherever a loss had been incurred.

195. How far it would be possible to constitute such boards efficiently is a difficult question to decide. They must be composed wholly or mainly of experts accustomed

to the business of marine insurance, and familiar with all its technicalities. Whether it would be possible to withdraw a sufficient number of such men from their ordinary business at a time when that business was necessarily peculiarly exacting and anxious is a question on which the opinions of witnesses differed. Probably a satisfactory arrangement could be made, especially if a retaining fee were offered in peace time to those whose services it was desired to secure in war. But it must be admitted that such a system would differ fundamentally from the whole custom of marine insurance as hitherto practised; that it would be foreign to the habits and traditions of all concerned in it; that it would introduce an element of uncertainty into a transaction, the main object of which has been to eliminate risk, and would thus, to some extent at least, frustrate the very purpose of the guarantee. We think that if the experiment were made it would give rise at first, at any rate, to much grumbling and dissatisfaction. It might, however, be accepted by shipowners and merchants if no contribution were expected from them in return, and if they were left free to supplement it by such other private arrangements as they thought fit. But we believe that any attempt to render it compulsory, to prevent other war insurances supplementary to it and to levy a contribution to the cost from the assured, would be certain to arouse great opposition, and would not be supported by the majority of those interested.

Settlement of Claims.

196. It may be advisable to deal rather more fully with the question of the Tribunal which would have to be appointed to adjudicate upon claims.

197. We had originally contemplated a single small board, composed almost entirely of experts and sitting in London. We suggested that their decision should be final. But this proposal did not meet with entire approval from the witnesses.

198. In Mr. Owen's opinion the Board of Claims should consist of nine underwriting experts and three trustees of the "National War Indemnity Fund"—which Mr. Owen proposed to raise by enforced contributions from ship and cargo owners in time of peace. He thought that on principle the board should be formed as nearly as possible on the lines of a marine insurance company, so that merchants might feel confidence in it, and that in practice a board of this kind would be found to be less liberal in dealing with other people's money than with their own, because their individual reputations for generous dealing would not be at stake. Owen, App. Owen, qs. 2158–62

199. Mr. Beck recommended the employment of average adjusters, and Mr. Bolton advised a majority of underwriters because "they are about the only people who would understand the work that would come before them." In Mr. Bolton's opinion twelve responsible men might be chosen, of whom two would give one day each week by arrangement among themselves. He thought that a number of men was not required for the settlement of claims, and that with the addition of a representative of the Government, making three in all for ordinary meetings, with an occasional meeting of a fuller board to settle cases of special difficulty, the work required would be satisfactorily accomplished. Beck, q. 1245 Bolton, q. 2744 Bolton, q. 2745

200. On the other hand, Mr. Mitcalfe, who has had exceptional experience in dealing with claims in connection with the North of England Indemnity Association, thought that the work involved would be very heavy, and added, "You have nothing to teach a merchant as to making claims." Others spoke equally strongly with regard to the amount of work entailed, and the establishment of Boards of Claims in Liverpool, Glasgow, Newcastle and London was recommended. Mitcalfe, q. 4386 McArthur, q. 4516 Boulton, q. 1655 Jeans, qs. 4177, 8 Hill, q. 3708

201. Opinions were divided as to whether or not appeals from the decision of the board as to the validity and the amount of claims should be allowed, it being held on the one hand, that they should be forbidden, since the decisions would be arrived at on the best expert knowledge available, and that no better tribunal could be found; and, on the other, that it would not be satisfactory to the mercantile community if the prescribed department, or the boards appointed under it, were enabled to give a decision against which there was no appeal. Miller, q. 3446 Brightman, qs. 3207, 3303 Maclay, q. 4076 Wright, q. 2018 Owen, q. 2158 Bolton, q. 2753 Hill, q. 3709 McArthur, q. 453 Strachey, q. 493

202. Mr. Bolton said that unless an appeal was allowed both to the assured and the Government the banks, upon whom the greater part of the business of shipowners and merchants depended, would look askance at the policies brought to them. If there were no appeal it might happen that both the State and the marine underwriter would deny liability in the event of loss, and no bank would consider a document satisfactory under which this was possible. Mr. Hill found a further objection in the fact that the hands of the board would be tied as to the manner of investigating claims if they were placed in the position of arbitrators.

Bolton, qs. 2748–50, 2753
Hill, q. 3709

203. It is, we think, clear that a single tribunal sitting in London would not meet the necessities of the case and the requirements of claimants. The need for prompt settlement of claims was recognised and enforced on all hands, but where the values, &c., have not been agreed upon and a policy issued beforehand this involves proof of British register and of compliance with the Admiralty regulations, proof that the loss was due to a war risk and not to any ordinary peril of the sea, and examination and assessment of value in the case of each separate interest. A single board would be overwhelmed by the task and it would be necessary to constitute similar boards in all the principal sea ports.

204. But to correlate and bring into harmony the possibly conflicting decisions of these local tribunals an appeal would have to be allowed to some central authority whose decisions would be binding on them all. While to meet the case put by Mr. Bolton and to give such security as would be required by bankers and others it would seem necessary that that appeal should go directly or ultimately to the Law Courts.

205. It will be seen that a very formidable and not inexpensive machinery would have to be created for the administration of the scheme. We doubt whether it would be possible for the State to organise successfully on the outbreak of war the large staff which would be required.

Position of Bankers, Bill-Brokers, Discounters, &c.

206. But assuming proper tribunals could be constituted and that the security as above defined were sufficient to satisfy shipowners and merchants, there still remain other interests, and those most important ones, to be considered.

207. By far the greatest part—it might almost be said the whole—of the cargoes coming to this country, are financed in transit by bankers, bill-brokers, or discount houses, who advance a greater or less proportion of the value against bills with shipping documents attached. These documents include the ordinary policy of insurance against marine risks, and in time of war would naturally embrace an insurance against war risks also. The question, therefore, arises how far would a general guarantee of the kind indicated above, which bore no reference to the particular consignment and guaranteed no definite value, be acceptable to and accepted by this very important factor in British trade as now organised.

208. On this point the witnesses chiefly interested were unusually unanimous, and the need for some form of policy was insisted on, since policies are invariably used as securities for raising money, and it would be necessary to see that bankers were properly protected. We were assured that bankers and discount houses would require to know that a certain value of ship and cargo had been accepted under the indemnity before negotiating advances; and in each case there would have to be some transaction, as regards the particular ship and particular cargo between the Government and the persons concerned. Mr. Estall even put in a claim for a "practically unconditional policy," saying, the greater the difficulties, the less the value of the guarantee, and the greater the restriction on trade, and that bankers would require to be informed of the tenour of Admiralty instructions before advancing money, since it was conceivable that the instructions given would be so stringent as to prohibit the transaction of business.

Beck, q. 1317
Nugent, qs. 3595–3596
Estall, q. 3852
Jeans, q. 4176
Toomey, q. 4654
Estall, qs. 3924, 3849, 3850

209. Mr. Jeans, speaking with special reference to the Australian trade, said that it was the custom for the insurance on cargoes to be paid for by the consignee, and

that under an indemnity the consignee would expect to receive a document showing that his interests had been covered by acceptance of the State's conditions. In his opinion each venture, and each interest in the venture, would require the Government to issue a separate certificate, which would be a difficult business, and require a very large staff. He feared that there would be an enormous amount of labour entailed in issuing policies, and that Government would find a difficulty in obtaining the services of competent men to take up what must be but temporary employment. Jeans, q. 4173 Jeans, qs. 4176–8 Jeans, qs. 4239–40

210. We think it is evident from the above that under existing circumstances, and the customs which now prevail, no scheme of indemnity or insurance unaccompanied with provision for the issue by the State of a policy guaranteeing a specified value in the case of each consignment would meet the requirements of trade. We have already called attention to the apparently insuperable difficulties in the way of the fulfilment of this condition owing to the magnitude of the task and the enormous staff which it would entail. On the other hand, it is possible that if a scheme of indemnity commended itself to the public on general grounds, means might be found for overcoming the difficulties in question.

Part IV.

Summary of Conclusions.

211. Having finished our survey of the evidence, and having passed in review the principal points which arose in the course of our inquiry, we are now in a position to summarise the conclusions at which we have arrived. We have already stated (paragraph 16) that the evidence on almost every point was of a most conflicting character. From the nature of the inquiry committed to us this was inevitable. Material for forming a conclusive judgment is not available, and the major portion of the evidence given by witnesses dealt necessarily with matters of opinion on which others equally competent might, and often did, express diametrically contrary views. We recognise that in the mass of evidence given before our Committee, or recorded in the Blue Books of the Royal Commission on Food Supplies, there is much which would support a different conclusion from that at which we have arrived; but, after giving full weight to these diverse opinions, we are of opinion that it is not desirable that the State should undertake to make good to shipowners or traders the losses incurred by them through the capture of shipping by the enemy in time of war.

212. The advocates of such a proposal argue that in the absence of a National Guarantee the shipping industry and oversea trade of the United Kingdom will be thrown into confusion on the outbreak of naval war between this country and any other great naval Power; that shipping will be laid up or transferred to neutral flags; that insurance against war risks will be impossible, or possible only at prohibitive rates; and, consequently, that the prices of food stuffs and raw materials will rise to such an extent as seriously to affect the national life; whilst the strategic dispositions of the Admiralty will be hampered and perhaps over-ridden by the clamour of public opinion alarmed at the interruption of our trade, and inflamed by the scenes of distress to which that interruption would give rise.

213. In our opinion these apprehensions and the efficacy of the suggested remedy are exaggerated. We think, for the reasons already given, that, assuming the maintenance of an adequate naval force (17a and 82–90), there is little danger of British shipping being laid up on any large scale at any rate for any long period (48–a). There is more likelihood of transfers to a neutral flag being attempted, but when due allowance is made for the difficulties of the operation and for the uncertainty surrounding the question of contraband and the consequent insecurity of neutral ships and their cargoes, it seems improbable that they will affect any considerable proportion of the mercantile marine (48 b–d).

214. Some loss must, however, be expected under each of these heads, and in so far as it takes the form of transfer, it might be permanent and attended with some loss of trade (48–e).

215. As regards the ordinary facilities for insurance it does not appear that there was ever real difficulty in securing a quotation in the past, and though it seems to be supposed in some quarters that rates have often been fixed too high, and that underwriters have been accustomed to make unduly large profits out of them, the evidence we have collected does not bear out this view. Nor has it been proved that in future wars the market would be so restricted or the rates so prohibitive as to necessitate interference by the State (56 and 63–64). It is impossible to give any estimate of what the rates are likely to be in any future war in which we may be engaged, or to state with any approach to exactness what the extent of the facilities would be. They will vary with the circumstances and the episodes of the particular struggle. That the rates will be sometimes high enough to handicap seriously particular trades must, we think, be admitted as probable. This will almost certainly produce some increase in the cost both of living and of manufacture, which may even at times be serious.

216. But it is obvious that any National Guarantee for losses offers a very imperfect remedy for this particular evil. Such a guarantee would tend to prevent shipowners from laying up or transferring their ships, but could not of itself secure the safe arrival of ships and cargoes. This is the work of the Navy, and the Navy alone, and it is important that nothing should be allowed to obscure this vital portion of its duty (89-90). For prices, in so far as they are affected by sea risks, will in the main depend not upon the number of ships which put to sea, but on the proportion of voyages which are successfully completed. The fact that the merchant or the shipowner was compensated by the State for his loss would afford no relief to the nation which was deprived of its supplies. At best it could only relieve the consumer of that portion of the enhanced cost which represented the actual amount of the premiums otherwise payable ; but in our opinion this would be only one, and by no means the most important, of the factors controlling prices (70).

217. At this point, therefore, we reach the conclusion that the dangers to be apprehended from our present situation, and the advantages which could under any circumstances be secured by a National Guarantee, are neither of them so great as the advocates of such proposals have generally supposed. We admit, however, that these dangers do exist to some extent, and that a suitable scheme of National Guarantee, if such could be devised, would diminish, though it could not absolutely remove them.

218. Can, then, such a scheme be devised, and do the advantages which it is capable of conferring, outweigh the disadvantages which are inherent in any proposal of the kind ?

219. It will be seen from the preceding paragraphs of this Report, and from the Minutes of Evidence, that we have given no small portion of our time and attention to these two questions, for it is upon the answer which is made to them that the final decision upon the subject of our Inquiry must turn.

220. As it appeared to us (48 d and 95) that the war charges on neutrals would be not inconsiderable, and that the offer of a free indemnity would not merely prevent the owner of a British ship from being unduly handicapped in his competition with the neutral, but would actually place him in a better position than he occupies in time of peace, it was natural to prefer a contributory scheme if such could be devised. Several plans of this kind were suggested to us. They are examined at some length in paragraphs 96–127 of this Report ; but the conclusion to which we are forced is that they are none of them practicable, and that if a National Guarantee is to be given at all, it will be necessary that it should take the form of a free indemnity (128).

221. This is in itself undesirable, for, as already stated, it gives the guaranteed something more than on any view of the case he is entitled to claim ; but this objection is not in itself conclusive. If, however, the whole cost of the losses of ships and cargoes is to be transferred from the shoulders of the owners to those of the taxpayer, it becomes additionally important to form some idea what the extent of this burden would be. Unfortunately no materials exist for such a calculation. The various estimates laid before us started from widely different hypotheses, and differed

largely in amount. There is little to guide anyone desirous of making a choice among them, which at best can only be the result of a number of assumptions, any one of which may be disputed. We confine ourselves therefore to the statement of our opinion that though the proportion of losses may be small, the aggregate amount involved might be considerable. Spread over the vast volume of our mercantile marine it might form but a small percentage of the total, and might involve on the average only a moderate rate of insurance; but regarded as a sum which it would be necessary for the Chancellor of the Exchequer to provide from taxes or loans at a time of great financial stress, it would be a very formidable addition to the burdens of the taxpayer and the difficulties of the Treasury (129-30). Nor can we admit the validity of the plea urged by some of the witnesses that the total loss to the nation would in any case be the same, and that it would be more fairly distributed through taxation than if left to find its way to consumers through the ordinary channels of trade (131). It is difficult to apply this argument to the case of imported luxuries, such as diamonds or ostrich feathers; for it is obviously unfair to keep down the price of these for the benefit of the comparatively few wealthy people who purchase them at the expense of the whole body of taxpayers throughout the kingdom. Yet it was generally admitted that no distinction could be made in practice between luxuries and necessities. Both are important to the maintenance of our shipping, as affording freight, and both affect the interests of the labouring population, either as consumers or as workers. But there is another and a stronger objection to the transfer of these liabilities to the State. Shippers and shipowners have full control over their ventures; the taxpayer can at best exert but an indirect and imperfect supervision. Shipowners and merchants may make heavy losses, but they may also expect correspondingly high profits on successful ventures. If the transfer be allowed the losses will fall on the taxpayers at large, but the profits will be retained by individuals. Lastly, the taxpayers who would be thus called upon to make good the losses of individuals concerned in a particular form of trading would themselves be in many cases large sufferers from the same causes; but, as in their case the loss took a different form, they would receive no compensation (135–136).

222. To these objections must be added the effect of an indemnity in tending to cause the transfer of goods from foreign to British ownership before instead of after the voyage (137–142), thus increasing the amount of British property at risk; the influence which the knowledge of the existence of such an indemnity must almost inevitably exercise upon decisions in the Enemy's Prize Courts, by increasing their tendency to condemn and by weakening the inducement to neutral owners to prosecute vigorously their claims for release of their goods when seized in British ships (143–145); the difficulty of exercising the necessary Admiralty control over voyages, and its probable bad effect on the initiative and enterprise of masters of vessels (146–150); and the serious danger of fraudulent claims, against which the State would be unable adequately to protect itself (151–160).

223. No one of these objections is necessarily fatal by itself to the idea of a National Guarantee, but their cumulative effect is formidable. Taken together they outweigh, in our opinion, any possible advantages, limited as we believe these advantages to be, which might be derived from such a proposal. But if any doubt still remains as to the answer to be given to the question referred to us, we think it would be resolved by a consideration of the administrative difficulties inseparable from any scheme of National Guarantee which are discussed and developed in paragraphs 167 to 210 of this Report. The immense difficulties attendant on the determination of values, and on the settlement of claims are themselves a serious obstacle to the adoption of any scheme. The more closely they are examined, the more formidable do they appear, and we are unable to discern any solution of them which is not open to serious criticism and even to grave abuse

224. If the dangers by which our commerce and industry are threatened were as great as they appear to the advocates of such schemes, or if the remedy provided by a National Guarantee in any form were complete, it might perhaps be worth while to face the enormous administrative difficulties involved in the adoption of a scheme, to accept the risk or even the certainty of having to pay some fraudulent claims, and take the financial leap in the dark involved in accepting an unknown, but in any case

considerable, financial liability. But this course could only be justified if the case against inaction were overwhelming and the remedy certain and complete. In our opinion neither of these conditions holds good, and we are therefore unable to recommend the adoption of any form of National Guarantee against the war risks of shipping and maritime trade, except that which is provided by the maintenance of a powerful Navy.

225. We desire to record our obligations to our Secretary, Mr. George H. Duckworth, for the very valuable assistance which he has given us both during the progress of our inquiry and in the preparation of our Report.

*RESERVATION BY SIR CHARLES OTTLEY.

I have signed this Report and share the opinion of my colleagues, on the one hand, that the difficulties in the way of State action have been found to be more considerable than had been anticipated, and, on the other, that amongst the important classes more immediately interested there does not at present exist any such clear-cut and universal demand for a national guarantee of war risks of shipping as would, in view of these difficulties, justify State intervention.

The only point on which I wish to enter a Reservation is this: I think it would be very regrettable if our inability to recommend State action to-day should come to be regarded as definitive proof of the uselessness and impracticability under any circumstances in the future of any scheme of National Guarantee.

I regret that owing to absence at the Hague Conference I did not have an opportunity of putting questions to certain of the later witnesses, and in consequence I am sensible that I have not had quite the same opportunities as the rest of the Committee in forming an opinion. But a careful study of the evidence leaves me in full agreement with Sir George Clarke that "many of our witnesses were evidently unprepared by any previous study of a somewhat difficult subject."

In any case our Committee will not have laboured in vain if its Report serves to attract public attention to a matter which is of some moment from the point of view of national interests.

C. L. O.

24/3/08.

* Subject to reservation.

MEMORANDUM BY SIR GEORGE CLARKE.

As I shall unfortunately be unable to take part in the discussion of the Report, I trust that my views, as explained in the following notes, may be recorded in an appendix.

1. The measure of risk to our Mercantile Marine in war depends on the losses which an enemy could inflict. Unless British shipping is laid up, the only possible restraints upon these losses must be sought in :—

(*a*) Direct naval action applied to control the movements of hostile warships, and

(*b*) Organized arrangements for the transmission of information in order that shipping may obtain the maximum amount of protection from the naval dispositions at any given time.

The relative risks of individual ships will evidently depend to some extent upon their speeds, but this cannot affect the above general propositions.

2. Whether the movement of the Mercantile Marine in war can be maintained to the extent necessary to secure the food supply of the people and to avert economic disaster, is therefore essentially a naval question. Only a sufficient and efficient Navy intelligently handled can guard these vital interests. Unless these conditions are fulfilled, any system of National Guarantee will be futile.

3. It is impossible to forecast with any approach to accuracy the probable loss in a war with any assigned Power or Powers; but history—our only guide—plainly shows that :—

(1) Our losses in war have never been large except when the Navy has been over-strained by great combinations of naval Powers.

(2) When the Navy has been distinctly superior to its antagonists the volume of British trade has increased during war.*

(3) Warfare against commerce has never been effective in the long run except when the battle fleet of one combatant has been defeated or kept under full control. The protection of commerce, therefore, depends ultimately upon the battle fleet.

4. It may be claimed that these historical lessons, being drawn from sailing days, are now valueless. It is my strong belief that, in modern naval and maritime conditions, it is easier to protect commerce than formerly, and such experience as is available appears to confirm this view. At least it may fairly be said that there is no reason to assume the contrary. I regard Captain Mahan's estimate of $2\frac{1}{2}$ per cent. loss of British shipping during the wars of the French Revolution and Empire as somewhat misleading; but his general contention that our losses were moderate appears to be beyond question.

5. Whatever may be regarded as a reasonably probable estimate of maritime losses in any hypothetical war, it is certain that, at the outset, the tendency would be towards wholesale exaggeration of the risks. For more than ninety years this country has had no experience of a war in which its commerce was endangered. There have been, however, plain indications that excessive estimates of risks would prevail, and having regard to the extreme complexity of modern trade, and the many interests dependent upon it, panic with far-reaching consequences might easily be engendered.

6. As has been pointed out (Paragraph 2), it is vital that the movement of British shipping should be maintained in war, and whatever estimate of captures may

* Notably in the case of the Seven Years' War and the wars of the French Revolution and Empire.

be adopted, the number of ships which will reach port safely must evidently depend upon the number that go to sea. The main question that presents itself for consideration is, therefore: Will the apprehension of loss be so great as to prevent ships from sailing in sufficient numbers to guarantee the minimum movement necessary to ensure our food supply and to avert economic disaster?

7. The only justification for any form of National Guarantee of the war risks of shipping and cargoes is the strong presumption that excessive or violently fluctuating insurance rates might have disastrous effects upon the shipping and mercantile interests, and through them upon the nation at large. Unless it is clear that such excess or fluctuation would :—

(*a*) Unduly check the movements of shipping.

(*b*) Cause the laying up of shipping on a large scale, or

(*c*) Lead to a considerable transfer to a foreign flag,

there can be no sufficient case for a National Guarantee.

8. We have little evidence to show that (*c*) is probable or possible on a large scale, and, in my opinion, this consideration may be dismissed.

9. As regards (*a*) and (*b*) the evidence is not altogether satisfactory, Many of our witnesses were evidently unprepared by any previous study of a somewhat difficult subject. It was, therefore, natural that they should have freely contradicted each other, and, in some cases, themselves. There is, however, a large majority of witnesses in favour of some form of State guarantee, and in certain cases emphatic opinions in this sense were forthcoming. Evidence given before the Royal Commission on Food Supply also tends to support the view that there is real danger of a serious check to the movement of shipping from the undue rise or fluctuation in insurance rates, from shrinkage or the closing of the war insurance market, or from a fall in underwriters' credit, which, by restricting bankers' advances upon policies, might cripple maritime enterprise.

10. Even upon such a point as the capacity of the insurance market to deal with war risks, there is a direct conflict of evidence. Thus Mr. Frederic Bolton (underwriter and insurance broker at Lloyd's) considers that the effect of losses would be to stop war insurance, and that the Government would eventually be forced to take action. (Qs. 2843 and 2765.) On the other hand, Mr. A. W. Roberts (underwriter and insurance broker at Lloyd's) holds that the market would be able to deal with war risks, and Mr. J. T. Binning (chairman of the Liverpool Underwriters' Association) believes that there is no danger of commerce being checked by reason of high insurance rates. (Q. 1944.) These are typical instances, among many, of the irreconcileable views of witnesses belonging to the same profession.

11. Having regard to the opinion of the majority of witnesses, to the strong support of the Royal Commission on Food Supply, to reasonable probability, to the representations of Chambers of Commerce, and to such actual experience as is available, I have come to the conclusion that State action is necessary. I believe that the exaggeration of war risks leading to excessive and violently-fluctuating insurance rates, to the weakening of the values of policies or securities, and possibly to the closing of insurance markets, might, by imposing a serious check upon the operations of the Mercantile Marine, entail grave national danger. After the early stages of war have passed it is to be expected that estimates of maritime risks will begin to approximate to true standards. This early period, during which insurance is, as one witness admitted, a system of betting against capture, must, therefore, be regarded as critical. If the State can succeed in steadying rates until they rest upon a reasoned basis, all that is necessary will be attained. From the national point of view, it is the overestimate of risk, with all the consequences involved, that has to be feared, not the actual captures, which, if the Navy is maintained at an adequate strength, and is effectively directed, will not reach such dimensions as to constitute a public danger.

12. Whatever steps may be taken in the direction of a State guarantee of the risks of shipping, it is clear that the general financial disturbance to which war will

certainly give rise must affect the whole economic position of the country, and react upon maritime interests. In Sir R. Giffen's view, this disturbance will be so serious that difficulties caused by high insurance rates would be relatively trivial. I agree that a war between two great commercial and industrial Powers would, in present financial conditions, produce convulsions in the money markets to an extent of which past experience supplies no indication Whether our financial position can be rendered less vulnerable than it has now become is a question which lies outside our reference, and remedies, if they can be devised, must entail a modification of financial conditions in peace. On the other hand, interference with the peace conditions of maritime commerce appears impracticable, while support to the operations of shipping, by any means which did not throw undue liabilities upon the State, would tend to mitigate the economic disturbance arising from causes independent of an enemy's attacks on our trade routes

13. The forms which a State guarantee might assume may be classed under two heads :—

A. Free indemnity.

B. Purchased indemnity, including any system under which the ship and cargo-owner contributes.

14. The Committee has placed before the witnesses the outlines of alternative schemes under which either the whole liability for war losses would be assumed by the State, or guarantees would be given to ship and cargo-owners on payment of an *ad valorem* percentage charge. The evidence was most conflicting. Some representative shipowners (Messrs. Leverton Harris, H. R. Miller, A. N. Hill, J. S. Mitcalfe, C. McArthur), urged the advantage of free indemnity, which Mr. J. P. Maclay regarded as the more favourable arrangement from the point of view of the State. Of the witnesses who advocated State action, a small majority was in favour of purchased indemnity, and some who supported the alternative agreed that this system, if practicable, would be an improvement on existing conditions. Moreover, the preference given to free indemnity was, in some cases, due to a belief that no plan of State insurance based on premiums was workable.

15. A system of free indemnity appears to be open to the strongest objections. It would necessarily tend to over-statement of values ; it lacks all elasticity, and its apparent simplicity vanishes on investigation. In war every interest would suffer, and it is by no means clear that the shipping interest, as a whole, would suffer most, since enhanced profits would certainly be made on successful voyages. The popular illusion that war raises prices was dispelled by Sir R. Giffen, and it is a fact that prices tend to fall except when the production of special commodities is directly checked by the exigencies of belligerents. On the other hand, freights are certain to rule high.

16. The suggestion that the competition of neutrals would seriously restrict the profits of British shipping during war appears to be ill-founded. Hostilities between two great maritime Powers would render the shipping of both liable to capture, and there would not be sufficient surplus tonnage in possession of neutrals to take over any considerable proportion of the carrying trade of the belligerents after providing for normal requirements. Moreover, unless a rigidly restricted definition of contraband can be embodied in international law, it is evident that neutral shipping will not be immune, and must be insured in many cases. Great commercial powers are also great naval Powers, and in the case of a war with a minor commercial Power, the British Navy would be able to protect our trade so effectively that no form of State guarantee could be needed. Finally, it is certain that if Great Britain were involved in war a large amount of mercantile shipping would be taken up for naval and military purposes at liberal rates.

17. While there might be heavy losses to individual firms during the early stages of war, there will be certain compensations, and there is no reason to believe that the shipping interests, as a whole, would suffer to such an exceptional extent as to justify the adoption of free indemnity. I consider, therefore, that this system would be regarded as grossly inequitable by the general public, and must be unhesitatingly dismissed as lying outside the scope of practical politics.

18. On the other hand, experience has shown that a material rise in war risk premiums does not check maritime operations, and, as a small majority of witnesses agreed, there is no valid objection to the principle of a limited *ad valorem* contribution levied on shipping and cargoes. A system based on this principle, must, however, be thoroughly practicable, and ready to come into use whenever the necessity arises without dislocating business methods, or imposing harassing conditions on the trading community.

19. I consider that it is absolutely impossible for the State to set up an Insurance Department at the outset of war. The magnitude and multitude of the transactions involved would alone suffice to render any such scheme impracticable. Government Departments have no experience of insurance business, and it would, therefore, be necessary to invoke the aid of a large body of experts, who could not be expected to examine the situation with the anxious care which is necessitated by personal liabilities. Moreover, if under such a system insurance rates fluctuated considerably from day to day, the advantage from the point of view of the maritime interests would be heavily discounted. It is, therefore, natural that many witnesses, who conceived of no alternative except a State Insurance Department, should have declared for free indemnity.

20. On the other hand, if the State were to lay down a schedule of rates corresponding to zones of voyages, and to empower established insurance offices to issue policies on commission, the practical difficulties will be found to disappear.

21. It is obviously impossible, even if it were necessary, to devise a schedule of rates so adjusted as to balance receipts and losses, because neither can be estimated with any approach to accuracy. The object of the State is not to make a successful speculation, not to guard itself against possible loss, but by enabling the ship and cargo-owner to know their maximum liability to prevent maritime enterprise being checked by a sudden rise of rates which might be out of all proportion to the actual risk, or to the risk as modified by suitable precautions.

22. The term "market rates," which is sometimes applied to war insurance, will be found on examination to be meaningless. War insurance being based upon conditions of which there is little experience, it may be expected that any heavy loss to a section of the market would instantly react upon the whole and cause a sudden general rise of rates. The alarm would be general, although the actual loss might not indicate a real increase of risk, and might quite conceivably lead to an immediate diminution of risk. Meanwhile, however, shipping would be heavily penalised, and vessels might consequently be kept in port. Thus it is the effect of loss upon the resources of the individual underwriter, not the true measure of the risk which may fix the insurance rates. In other words, the so-called market rate is determined, not by the proportion of loss to shipping afloat but by the incidence of the loss. If captures occurred at regular intervals, moderate rates might prevail. If two or three sensational captures occurred within a few days a sudden and excessive rise would be inevitable. War insurance is not a science, not even a business in the strict sense of the term, but a psychological process.

23. The object of the State being simply to prevent excessive fluctuation of rates by laying down a limit, I consider that a schedule on the following lines would fulfil all reasonable requirements :—

(*a*)	Vessels crossing the English Channel or North Sea	½ per cent.
(*b*)	Vessels entering the Baltic	1 ,, ,,
(*c*)	Vessels passing through the English Channel	¾ ,, ,,
(*d*)	Vessels passing through the Irish Channel	¼ ,, ,,
(*e*)	Entrance of English or Irish Channel to Gibraltar	¾ ,, ,,
(*f*)	Mediterranean	½ ,, ,,
(*g*)	Entrance of Channels to Cape or South America	1 ,, ,,
(*h*)	Entrance of Channels to North America or West Indies	1 ,, ,,
(*i*)	Suez or the Cape to Australia or the East	½ ,, ,,

Under this schedule a vessel and cargo proceeding from London to Australia would be charged $\frac{3}{4} + \frac{3}{4} + \frac{1}{2} + \frac{1}{2} = 2\frac{1}{2}$ per cent. via the Suez Canal or $\frac{3}{4} + 1 + \frac{1}{2} = 2\frac{1}{4}$ per cent. via the Cape.

24. The application of the principle of fixed rates on certain zones would provide extreme elasticity, and while taking account of the length of voyage, and also roughly corresponding to the comparative risk, would meet the case of war with different Powers. Thus the ship and cargo-owner would be able to avoid all charge on portions of the voyage which might be regarded as safe in particular circumstances. The Government schedule would not come into play unless underwriters' rates had risen to its level or doubts as to their solvency had diminished the value of policies as securities ; and whenever the underwriter was willing to quote lower the business would lapse into private hands.

25. The State rates should be open to all ships under the British flag at all times, in order that the ship and cargo-owner might avail himself of the system if better terms could not be obtained during a period when the outbreak of war was expected

26. Witnesses informed us that there was no special difficulty in estimating the value of a ship, and that cargoes might be taken at the values accepted for purposes of marine risk insurance. The production of a marine risk policy issued by any reputable Firm might be made a condition of the issue of a State policy under the schedule. Another condition inscribed on the State policy would be that instructions received from State Agents at any port must be observed. A Board for the settlement of claims would have to be established at the outbreak of war. Its decisions should be final, and it should be so constituted as to command full confidence.

27. Although I gave an outline of this scheme ten years ago, it was new to the witnesses, and to place it before them in the course of examination was necessarily difficult. To underwriters especially the principle of fixed rates would naturally appear, at first sight, to violate all canons of insurance business. It will be found, however, that in some cases the answers were distinctly favourable to this scheme, and one witness to whom it was afterwards explained admitted the advantages.

28. The following objections disappear on examination :—

(1) There is no scientific basis for such a schedule of rates as is indicated in Paragraph 23. This applies with greater force to war insurance as now conducted. The State, however, has a definite object in view—that of steadying rates, of maintaining credit, and of preventing such a rise as might check the movements of shipping. These conditions will assist in framing the schedule, and should the rates be fixed at a height exceeding the estimate of risk, the ordinary market would absorb the business. On the other hand, if the rates are fixed too low, the State will carry all the risks, but will receive all the premiums. Unless, therefore, the captures were far greater than there is any reason to assume, assuming an adequate Navy, effectively handled (paragraph 3), the net loss to the State cannot be excessive, and would be of the nature of expenditure applied to make good unforeseen naval requirements. In any case, if the object is fully attained, some loss would be justified.

(2) The market would secure the good risks, and the bad risks would be thrown upon the State. It is obvious that the insurer will select the cheapest rates available ; but the bad risks of one day may be the good risks of the next, and *vice versâ*. The captures will, therefore, frequently falsify the estimate of risk, and the State will not necessarily incur an undue share of the loss.

(3) The shipowner who purchases a State indemnity will secure little advantage, because the State instructions (which he is bound to observe) will, with a view to save loss to the State, be so tightly drawn as to prohibit movement in an area regarded as dangerous.

It was generally admitted by witnesses that complete discretion as to navigation could not be permitted under any system of free or of purchased indemnity, and this objection must apply to all schemes of this nature. As, however, it must be the first object of the State to keep trade routes open, there must evidently be reluctance to impose serious delays upon shipping or to add to the marine risks.

29. The system of indemnity at fixed rates appears to me to provide the only practical means of fulfilling requirements which witnesses have stated to be imperative. Other suggestions have been put forward, such as a bonus on shipping and cargoes which completed the voyage to or from this country; free indemnity paid for by special tonnage dues imposed in war; small fixed premiums paid in time of peace to build up an indemnification fund; the State to guarantee the solvency of underwriters and companies. I consider that there are insuperable objections to all these proposals.

30. While the system of indemnity at fixed rates is the only one that I am able to support, I desire to emphasize the view that such a movement of shipping in war as is vital to our national needs can be secured by naval means alone. No system of State indemnity can do more than provide a safeguard against the effects of an exaggerated and violently-fluctuating estimate of risk which might prevent our shipping from going to sea with the grave results entailed. The extreme sensitiveness and the liability to panic which characterise modern commerce suffice, in my opinion, to justify the measures advocated. If the essential condition—that effective naval protection will be forthcoming in war—is fulfilled, as I believe it can be fulfilled, no undue burden will be thrown upon the State.

31. I think it necessary to point out, however, that some of the naval evidence appeared to be far from satisfactory. It was plainly intimated that the whole force of our fleet ought to be brought to bear upon the fleet of an enemy in war, and that no special arrangements to safeguard commerce would be made, at least in the early stages. I regard such strategy as misconceived, and not supported by the experience of wars in which our commerce has been at stake. Unquestionably the primary object must be to defeat or to assert full control over the enemy's fleet; but our naval strength should be such as to provide, in addition, means of affording some direct protection to commerce at the very outset of war. Further, it is essential that the whole question of the defence of commerce, and therefore of inspiring confidence, should be carefully and continuously studied in time of peace, and that all arrangements for the distribution of warships with this object, and for the communication of instructions to the Mercantile Marine, should be thought out in advance. It is true that the best plans are liable to be upset in war, but if no reasoned plan exists, and if the means of protecting commerce remain matters of controversy until the outbreak of war, the losses will inevitably be far in excess of what the country ought to be called upon to bear. I consider that the defence of commerce requires the permanent attention of a special branch at the Admiralty. The work involved is so important that this branch should be presided over by an officer of great experience, who should be in close touch with the interests concerned, and should command the full confidence of the maritime and mercantile community.

September 5th, 1907. G. S. C.

NOTE BY THE CHAIRMAN.

A copy of the Chairman's draft Report having been sent to Sir G. Clarke at Bombay, he forwarded the following observations, which it seems desirable to record, although some of the criticisms have been anticipated by the alterations made by the Committee before adopting the Report.

A. C.

March 24, 1908.

NOTE BY SIR GEORGE CLARKE ON THE DRAFT REPORT.

1. While I agree in great measure with the draft Report, I consider that it does not do full justice to my scheme, or bring out all the advantages that may be claimed for indemnity purchased at rates fixed by the State.

2. Ample allowance must be made for the fact that this scheme was new to the witnesses, who did not wholly comprehend its nature. I endeavoured to bring the points before them in cross examination; but this method was not very satisfactory, and it is clear that much misunderstanding prevailed. Thus Mr. Gow thought that the fixed rate might be "grossly exaggerated" and that the State "might be overcharging for" the risk. As the open market would obviously be resorted to if the State rate proved, at any time, higher than the risk demanded, there could be no possibility of "overcharging." Similarly the objection that the State rate might be "grossly inadequate" is easily disposed of. Again, Mr. Strachey was of opinion that the scheme "would have good results and would be much better than nothing," but thought "it would be simpler" for the State "to assume the whole risk." A little consideration would have revealed the fact that the real complication arises in the computation of values, and is, therefore, equally entailed by free indemnity. Moreover, no valid reason can be alleged for saddling the State with risks towards which nothing is contributed, thus creating in time of war a privileged class.

3. In spite of the general failure to realise the nature of the working of my scheme, I think that the opinions referred to in Paragraph 116* of the draft Report must be regarded as distinctly favourable. I am also convinced that further reflection, based upon an adequate conception of the principles of the scheme, would have led to a larger measure of approval from such witnesses as were neither solid in favour of free indemnity nor convinced that no form of national guarantee was required. I submit that the draft Report does not sufficiently indicate the significance of some of the concessions made in cross-examination.

4. Turning to the criticisms of the Committee (125), I am not able to admit that the State rate could not be fixed on "a reasoned basis, or any stable or arguable foundation."† It is, I believe, possible to frame a schedule of rates on rational grounds, while the elasticity of the system would enable it to adjust itself to developments which could not be foreseen. I may point out that the schedule quoted in Paragraph 115‡ was suggested only as a model, and was not intended to be regarded as a final proposal.

5. In my note of 5th September, 1907, I have dealt, I hope effectively, with the "objection" (126) that the scheme "would leave the State with all the bad risks and the market with all the good ones."

6. I venture to think that the apparent inconsistency alleged in Paragraph 126† in the cases of the Australian and the cross-channel voyages does not really exist. It is, on my naval hypothesis, wholly inconceivable that the Channel passage should be endangered for "300 days." The probability is that this particular voyage would either be safe or too risky to be attempted. In the one case, the ½ per cent. would not be paid. In the other, the Admiralty would either bar the passage

---

* Now Paragraph 117. † Since amended. ‡ Now Paragraph 116.

at State risk altogether, or would make special arrangements to safeguard it. In any case, however, the ship or cargo owner would not pay the State rate if the market offered better terms, and neither could have any possible grievance.

7. In Paragraph 164*, Mr. Estall is quoted as saying that "there would be a tremendous opening for fraud," and that "Government would not be able to compete with the tried machinery of Lloyds." In Paragraphs 167† and 168† the Committee appear to endorse this view. It is, however, an essential feature of my scheme that values should be taken from those accepted by any reputable Insurance Firm for the purpose of marine risks, and that the production of a policy issued by such a Firm should be a condition of the granting of a State war policy. Thus the "tried machinery" would operate for the protection of the State. Some witnesses, if I remember right, admitted in cross-examination that Government valuations might thus be arrived at.

8. Lastly, I disagree with the conclusion expressed in Paragraph 117‡ of the draft Report, which conclusion must, naturally and rightly, have influenced the Committee in deciding not to recommend any form of national guarantee. I am convinced that the outbreak of war with a strong naval Power will cause a disturbance in the insurance market of which we can form no adequate idea, and that this disturbance will re-act upon our whole economic structure with grave results. If the Navy is sufficient and efficient, the critical period will not be of long duration; but, meanwhile, irreparable injury may be inflicted. The scheme I have ventured to suggest would, I believe, serve to allay panic and to steady the operations of shipping until the naval situation was assured. The insurance of war risks would then be taken up by underwriters, who would be able to form a fair estimate – previously impossible—of the risks involved.

G. S. CLARKE.

Bombay, 3rd March, 1908.

---

* Now Paragraph 156.

† Now Paragraphs 159 and 160.

‡ This does not refer to the present Paragraph 117 but to a paragraph which does not appear in the Report, it having been struck out on consideration.

NATIONAL GUARANTEE COMMITTEE

TERMS OF REFERENCE

(1) Whether it is desirable that the State should undertake to make good to shipowners and traders losses incurred through the capture of shipping by the enemy in time of war;

(2) If so, whether such indemnity should be granted gratuitously, or should be coupled with the payment of premiums calculated to recoup the State—either wholly or in part—for the cost to be incurred;

(3) What conditions should be attached to the grant of the indemnity, and what arrangements should be made for the proper working of the scheme.

MEMBERS OF THE COMMITTEE.

The Right Honourable Austen Chamberlain, M.P. (*Chairman*).

The Right Honourable Sir R. B. Finlay, K.C., G.C.M.G.

Sir Thomas Glen-Coats, Bart., M.P.

Sir J. L. Mackay, G.C.M.G., K.C.I.E.

Sir George Sydenham Clarke, G.C.M.G.

Sir George H. Murray, K.C.B.

Captain Sir Charles L. Ottley, R.N., K.C.M.G., M.V.O.

Mr. H. Llewellyn Smith, C.B.

Mr. Edward Beauchamp, M.P.

Mr. Henry Neville Gladstone.

Mr. Frederick Huth Jackson.

Mr. Arthur Lindley.

Mr. George H. Duckworth (*Secretary*).

LIST OF WITNESSES

in the order in which they appeared before the Treasury Committee.

NOTE:—A précis of the Memorandum submitted by each witness in anticipation of his evidence has been drawn up by the Secretary, and is inserted at the beginning of the evidence. These précis are intended to give a clue to the line taken by the witness. They do not, of course, cover all the points on which the witness was examined, nor have they been used as "evidence" for the purposes of the Report.

Date.	Name and Qualification of Witness.	Number of First Question.	Page.
1906.			
First Day, 4th December - - -	The Right Hon. Lord Balfour of Burleigh, K.T. (Chairman of the Royal Commission on Food Supplies in Time of War).	1	1
Second Day, 11th December -	*Mr. T. G. Bowles. [No. III.] - -	68	8
Third Day, 12th December - - -	Captain Harry Jones, R.N., Assistant-Director of Naval Intelligence.	250	24
1907.			
Fourth Day, 19th February - -	Mr. F. Leverton Harris, M.P., Underwriter at Lloyd's, Director of the firm of Messrs. Harris and Dixon, Shipowners and Insurance brokers.	493	34
Fifth Day, 26th February - - -	Sir Theodore Angier, Shipowner - -	694	44
Sixth Day, 5th March - - - -	Mr. A. W. Roberts, Insurance broker, and Underwriter at Lloyd's.	845	50
	Mr. R. B. Lemon, Underwriter to the Marine Insurance Company.	1013	58

MINUTES OF EVIDENCE

TAKEN BEFORE THE

TREASURY COMMITTEE

ON

NATIONAL GUARANTEE FOR WAR RISKS OF SHIPPING.

FIRST DAY.

Tuesday, 4th December 1906.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir GEORGE H. MURRAY, K.C.B.
Captain C. L. OTTLEY, R.N., M.V.O.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. FREDERICK HUTH JACKSON.
Mr. ARTHUR LINDLEY.

Mr. GEORGE H. DUCKWORTH (*Secretary*).

The Right Hon. LORD BALFOUR OF BURLEIGH, K.T., called and examined.

The Right Hon. Lord Balfour of Burleigh, K.T.
4 Dec. 1906.

Lord Balfour, in a preliminary memorandum,* had submitted:—

(1) That the Royal Commission on Food Supplies in Time of War had been practically unanimous in suggesting that a Committee should be appointed to consider details, and to frame the conditions under which any scheme of insurance or indemnity should be undertaken by the Government.

(2) That distinct meanings should be attached to the terms "Insurance" and "Indemnity."

(3) That of the three suggestions submitted to the Commission, viz.:

(*a*) That the cost of insuring against war risks should be reimbursed to the British shipowner or merchant by the Government;

(*b*) That the Government should take the place of underwriters, and insure shipowners and shippers against war risks at premiums which, as there would be no question of making a profit, could be made much smaller in amount than if undertaken as a commercial enterprise;

(*c*) That the Government should make good to shipowners and shippers all or part of their losses by capture in war;

(*a*) may be dismissed as open to insurmountable objections, (*b*) may be described as National Insurance, and (*c*) as National Indemnity.

(4) That National Indemnity is preferable to National Insurance.

(5) That the object of a State Guarantee is "to minimise so far as possible, or even to eliminate altogether, the amount by which war insurance would increase the cost of commodities, and to prevent British shipowners being compelled, owing to the disadvantageous position in which they might find themselves with reference to neutral competitors, either to lay up their ships or transfer them to a neutral flag." (R.C. Report, Para. 229.)

(6) That the difficulties in the way of effective transfer are so great as to make such transfers impracticable.

(7) That a combination of insurance and indemnity by means of a fixed maximum payment as suggested to the Commission by Mr. Wilding, deserves the attention of the Committee.

(8) That although the question of insurance or indemnity came primarily before the Commission as a means of securing supplies of food and avoiding fluctuations of price, its effect upon our export trade is equally important.

(9) That the arguments in favour of a State indemnity are:—

(*a*) That payment would only be necessary for the actual losses incurred by capture.

(*b*) That the rise in prices due to increased freights and insurance under the apprehension of war would be wholly avoided in all cases in which war does not supervene. (*Cf.*, Penjdeh and Fashoda scares.)

(*c*) That the Admiralty would have a freer hand in the direction of naval policy.

(10) That it is fairer to place the cost of an indemnity on the taxes than to leave the indi-

* *Vide* note, p. iii.

The Right Hon. Lord Balfour of Burleigh, K.T.

4 Dec. 1906.

vidual consumer to pay as best he can, and that the consumer and taxpayer may, in this case, be regarded as convertible terms.

(11) That a State Indemnity should cover all classes of goods, and also payments for freights.

(12) That the question for decision appears to be whether the advantages of National Indemnity are sufficient to counterbalance the risk that a Government Department could not properly control its administration.

(13) That absolute control should be given to the Admiralty, so as to protect the Government against extravagant losses from unjustifiable risks.

(14) That it would be possible to maintain by special regulation a fair distinction between marine risks and war risks.

(15) That the legitimate business of marine insurance would not be interfered with to any extent, since it appears that the market for war risks is a small one.

---

1. (*Chairman.*) As we know, you were the Chairman of the Royal Commission on Supply of Food and Raw Material in Time of War?—Yes.

2. In the course of the evidence which you took, you had various schemes for national insurance or indemnity laid before you?—Yes.

3. You therefore gave some attention to the matter, and in your Report you made a recommendation, of which this Committee is really the outcome?—So I understand.

4. We have asked you therefore to attend to-day, in order that we might have the benefit of your judgment on the proposals laid before your Commission for guidance in our inquiry. You will have seen that three questions are referred to us, the first being "Whether it is desirable that the State should undertake to make good to shipowners and traders losses incurred through the capture of shipping by the enemy in time of war." I gather from your Report that you would answer that question in the affirmative?—Yes, I should answer it in the affirmative. Perhaps I should add that in paragraphs 226–247 and 266, 267 and 268 in Part IV. of the Report, we say what I think may fairly be said to be the unanimous opinion of the Commission; but it is discounted to a certain extent in paragraph 71, 72 and 73 of the Reservations signed by five of my colleagues, which should be read in connection with the main Report. But they all signed the main Report, and even in their own Reservations they conclude with an emphatic recommendation for the appointment of a Committee to consider the scheme in detail.

5. Though the minority who signed those Reservations do raise some objections on grounds of principle, still, their objections are mainly directed to the practicability of the scheme, are they not?—I read them as such.

6. That is to say, they have not themselves seen their way to a practical scheme. Taking it for a moment that it is desirable to have some scheme, perhaps you would tell us briefly on what grounds you think it is desirable?—I speak, of course, on these matters with very great diffidence, because I know practically nothing of the details of marine insurance, and all that I have learnt upon it I have learnt from the witnesses who came before the Royal Commission. Therefore, whatever I say now must be taken as being put forward as the opinion of one who desires to be modest in the matter and not to speak or dogmatise on things which are beyond his personal knowledge.

7. Could you give the Committee, briefly, the reason which led you to think that a scheme was desirable?—I would respectfully refer you to the Report, but it is primarily to get rid of some of the difficulties which I foresee owing to the change in naval warfare. In old days—taking the last time we were at war with a naval power—convoying was a principle duty of ships of war. I suggest that the change from sail to steam has made convoying practically impossible. Many of the shipowners do not seem, I think, to have grasped that, because some of those who came before us prefaced their evidence by the assumption that the Admiralty was going to protect them in the future as in the past, and in the same sort of way. Now, convoying, I am sure, is a thing of the past, on account of the clouds of smoke that would attract attention, and on account of the difference in the speed of the ships. Speaking again with very great diffidence, and summing up as far as I can judge the evidence of the expert naval witnesses, they will endeavour to protect shipping, not by convoying them about, but by bottling up, so to speak, the hostile navy in their own ports.

8. Two distinct objects have been suggested as reasons for some scheme either of indemnity or of insurance. One is to keep down the prices of food-stuffs and raw materials as near as possible to a normal level; and the other is to prevent the transfer of British shipping to a foreign flag. The two things overlap, but they are not the same. Am I right in understanding from your Report that you attach more importance to the question of keeping down the prices of food-stuffs and raw materials than to the question of the permanent transfer of British shipping to a foreign flag?—That would be so, very distinctly. Again I speak from what I have learnt from other people. This is a matter of law, and to a Committee, of which Sir Robert Finlay is a member, I should speak subject to anything he may say. I am a profound disbeliever in the effective transfer of shipping from our flag to another. In the first place, I do not believe it can be done in a hurry. I do not think that the prize courts of other countries would be easily induced to accept a transfer. They would use all sorts of technical pleas and difficulties as to the efficacy of the transfer; and I doubt very much whether capital could be got to insure that it was really paid for, and I do not see how delivery can be given when ships are all over the world. There are all sorts of other technical difficulties which I know deeply impressed our legal member, Professor Holland, who distinctly thinks that it is not a danger which need be seriously apprehended. I do not want to go far into it; but the cant example which is given to us is that of what happened to American shipping in the time of the war in the sixties. Now it was pointed out to me,—though a great deal of it was not put into our Report or into our evidence—that there was probably another cause for that which has been insufficiently attended to. That happened to be synchronous with a large change from wood to iron, as well as from sail to steam, in shipping; and the opinion of those who spoke to us was that the loss of American shipping was just as much because they did not keep pace with the new forms of iron building. There was a great boom in their affairs, they had other things to attend to and they did not do that; so they lost ground and have never regained it. It was quite as much from that as from the relatively small damage which was done by the two or three Confederate cruisers that escaped.

9. Passing now to the second heading of the reference to this Committee, let us assume that there is to be some form of either indemnity or insurance; will you tell us which form you would prefer?—I prefer what I describe as national indemnity. I attach great importance to the use of distinct phraseology, and to the same phrase connoting the same thing, because before us, people came in and talked of national insurance when they meant indemnity and so on.

10. Perhaps you would draw the attention of the Committee to the three forms of schemes that were suggested?—If the Committee will refer to paragraph 228 of the Report, that will show that three different suggestions were put before my Commission, and during the course of the inquiry, all of them were referred to by one witness or another as national insurance. The first of the three was that the cost of insuring against war risks should be reimbursed to the British shipowner or merchant by the Government. The second was that the Government should take the place of underwriters, and insure shipowners and shippers against war risks at premiums which, as there would be no question of making a profit, could be made much smaller in amount than if undertaken as a commercial enterprise. The third was that the Government should make good to the shipowners and shippers all or part of their losses by capture in war. I dismiss the first of these suggestions, as open to every objection which may be brought against either of the other two, and others besides. I propose, if the Committee will allow me, to follow the phraseology of our Report, and to describe No. 2 as national insurance and No. 3 as national indemnity. Personally, I prefer national indemnity, but I do agree that the object of all who have advocated either of these proposals may be said to be the same, and that object

is described in paragraph 229 of our Report. The exact words to which I refer are these: "To minimise, so far as possible, or even to eliminate altogether the amount by which war insurance would increase the cost of commodities, and to prevent British shipowners being compelled, owing to the disadvantageous position in which they might find themselves with reference to neutral competitors either to lay up their ships, or transfer them to a neutral flag." I have dismissed the question of the transference to a neutral flag, but I do think that the risk of a certain part of our shipping being laid up is serious, unless something of this kind is done, because the slower the ship, obviously the less chance it has of escaping the attentions of a hostile cruiser. I think the practically unanimous opinion of the ship-owning community is that if there is no convoy and no indemnity, the temptation to lay up the ships and keep them here will be very great, which would then cause an economic rise in the price of freights.

11. You did have a suggestion made to you at the Commission, I think, for something in the nature of a combination between insurance and indemnity—a kind of half-way house?—Yes. One witness, Mr. Wilding, suggested a scheme which I think might fairly be described as a combination of the two ideas underlying national insurance and national indemnity. That was that a premium of a fixed amount should be paid to the Government. The particular figure suggested by him was 5 per cent., and he attached importance to some figure as a guarantee for the fairness of the claims which would ultimately be made in the event of loss by capture, because payment of a premium of 5 per cent. would involve the stating of a sum as capital value on which the premium would have to be calculated.

12. Were you inclined to accept his view?—I was not personally. Of course, I cannot speak for the whole Commission; the majority, I think, distinctly agreed with me, but there were others who took a slightly different view. I think I am entitled to urge that we must take care we do not raise unnecessary difficulties of phraseology because when you come to think it out, if the premium charged for the insurance is one which is not calculated to recoup the cost to the Government, it is indemnity practically in everything except the name, although it does not go quite so far.

13. So that in your view the higher the premium and the more self-supporting the scheme the more it approaches insurance?—That, I think, is certainly so. I should like to point out that the higher the premium the less you do anything to get rid of what was very important for our particular purpose—namely, the economic rise in the cost of freight on bringing into this country the stuff that we want to live upon.

14. When you speak of the economic rise I am not quite certain that I understand the exact significance of the term?—I venture to refer to Part II. (3) of our Report. I took some pains with it, but it was very nearly cut out as too long and too complicated. When I speak of the economic rise I mean this, that if freights go up either from scarcity of transport or from the cost of insurance, the cost to the consumer of the article brought must rise, because the consumer must be the person who will pay all that it cost him. No one will bring it in as a philanthropist, and the consumer will therefore ultimately have to pay. I distinguish between that which I call the economic rise, and that which I will call the panic rise. I may say here privately that it was the object of some of those who promoted our inquiry to magnify the risks and get up a scare, and they brought working-class witnesses and others who said, "The price will go on to 80s. a qr.," or "It will be 160s.," and one man put it at 200s., and so on. We do not know what it will go up to because the stuff may not come in, and if there is a report of a naval disaster, and it is thought people are going to be starved as there is only a few weeks' supply in this country, there will be corners formed and up will go the prices. That I distinguish from the economic rise as the panic rise. Personally, any one who reads our Report will see that I am a profound disbeliever in the effect of that, or at any rate in its duration for any long time. The telegraphs will correct it. I do not believe you can blockade these islands, and—I speak strongly—I think it is absurd to say that wheat could remain at anything like 50s., 60s., 70s., or 80s. a qr. here, when it was at 30s. on the Continent, a few hours distant, and we have ports all round the country to which things would be brought.

15. Is there any other preliminary observation you would like to make?—Only this: Our instructions were to consider the conditions affecting the importation of food and raw material into the United Kingdom, and to advise whether any measure should be adopted in addition to the maintenance of a strong fleet by which the supplies can be better secured and violent fluctuations avoided. Those were the terms of our reference, and the question of insurance or indemnity in any form came primarily before us as a means of securing our supplies and avoiding those fluctuations. But there is another aspect to the question which was borne in upon my mind very strongly, and that was the probable effect of war prices for freight and insurance upon our export trade. I admit it was somewhat beyond our terms of reference, and it was upon that ground that, as a Commission, we did not go exhaustively into the subject. We confined ourselves to the recommendation which will be found in paragraph 268 as to the appointment of an expert committee. This point, the effect of war prices on our export trade, is, I venture to suggest to this Committee, at least as important as the other one.

The Right Hon. Lord Balfour of Burleigh, K.T.

4 Dec. 1906.

16. Generally, would it in your opinion be true to say that all the arguments which make for a scheme of insurance or indemnity in regard to the import of food supplies and raw material, equally make for such a scheme to protect our export trade?—I think so.

17. Perhaps I may ask you to tell us briefly your reasons for advocating a scheme of national indemnity?—I must start with the assumption that it will be admitted that the consumer will ultimately, in one form or another, have to pay practically all the extra cost of what he consumes. I think that is especially true of articles which I describe as necessaries, for example, food and raw material; and I suggest that in this matter the consumer and the taxpayer are convertible terms. Whether you call him the consumer or the taxpayer, in one form or another he will have to bear any extra cost that is chargeable as part of the costs of war. I suggest that it is better to put it on the taxes rather than to leave the individual consumer to pay it as best he can. I say that with diffidence, for I see Sir George Murray present, but I think that it is arguable in this way. Assuming only that we are dealing with the economic rise of prices, the ordinary insurance upon necessaries, such as food—and also the raw materials for manufacture, but take it on the food—would fall most heavily on the poorest class of the consumers. If you go into any form of national indemnity the cost would fall on the taxpayer, and its amount can be spread over a longer period by means of a war loan, or of taxation, to which all classes will contribute according to their means. You would get rid of that part of the rise which benefits no one but the underwriter If anyone has looked through the history of the scares for the last 15, 20, or 25 years, take, for instance, what is known as the Penjdeh Incident or the Fashoda Incident, or apprehensions of that kind, he will find that the insurance of war risks went up without war breaking out. Of course, if there was no outbreak of war and no capture, the whole of that, *qua* war insurance on the ordinary marine insurance, was profit to the underwriter; but the consumer had to pay. If any scheme of this kind was gone into, it is quite clear that nothing would have to be paid until a capture had actually taken place, and therefore there would be no justification for a rise of freight in respect of the war insurance until war actually broke out.

18. You have spoken especially of food-stuffs and raw materials; would you confine the scheme to those classes of goods, or would you make it applicable to all classes?—I would make it applicable to all classes of goods. Mr. Runciman, whose opinion is entitled to great weight on account of his practical skill and knowledge, wanted to make a difference between the importation of luxuries and of necessities. I do not think that is practicable; he stood alone in it, and I do not think it is worth while arguing. I think we must make a clean job of it, and indemnify or insure everything. But, passing that by, I attach very great importance to that side of the question which deals with our export trade and I suggest that if our export trade has to pay any increased cost for insurance in time of war it will be seriously handicapped in markets in which we are competing with other manufacturing nations, and perhaps we shall be driven out of those markets, in which even now competition is very keen. I should be much more afraid of these markets once being lost not being recovered than I should of the shipping being transferred to another flag. It follows, does it not, that if we lose our export trade there would at once be a loss of em-

The Right Hon. Lord Balfour of Burleigh, K.T.

4 Dec. 1906.

ployment at home and a consequent distress, just at the moment when it is most important that employment should be preserved and panic averted? I do not think I need develop that further unless I am asked questions upon it, because it seems to me obvious. The point I reserve is as to the expediency of indemnifying the exported goods. I am afraid of going a little beyond my depth, and you will stop me if I do. This is the point which is under the first head of your scheme where you use the expression "cargo liable to capture"; I do not quite understand what is intended by the phrase "cargo liable to capture." Is that intended to be equivalent to contraband, or is it is intended to touch on the question of the ownership of the goods? The ownership is, of course, a very important point, and it is a very complicated point. The ownership of the stuff we are bringing in, consigned to us, is probably ours, and therefore, being the private property of a belligerent, would be liable to capture by our opponent. If the stuff is being exported and is the property of the person to whom it is going, presumably a neutral, it perhaps would not be liable to capture because it is his property. Where the exact point occurs at which the export or import is transferred from the foreigner to us or from us to the foreigner would, of course, be a question for the Prize Court. It might be very complicated, but even if it were decided in favour of the person to whom the goods were going, still the delay and annoyance consequent on being taken to a Prize Court would handicap the man, because he would not get his goods at the time that was desired; and therefore, although it is an interesting point of law, it does not seem to me, whichever way it is decided, to be a point against the scheme of indemnity.

19. Of course, you understand that these two schemes, scheme A and scheme B, in no way represent any conclusion of the Committee at the present time; but we thought it was desirable to have something on paper to form a basis for discussion?—I understand that perfectly, and I am not going to use them. It is only as they were sent to me I thought I was not doing what would be useful to you unless I said everything, even if it was against my own view, because after all, there are difficulties, and they must be faced.

20. I think the schemes justify themselves in their object, in that they have enabled you to raise points of this kind?—May I say that so far as import or export to our colonies is concerned, whether going from us or coming to us, being to or from our colonies, they would be liable to capture. Therefore it strengthens my view in favour of an indemnity, because if we were sending goods to Argentina they might be the property of inhabitants of Argentina, and might not be liable to capture, but whatever was going between this country and the Cape, or Australia or New Zealand, either way, would, I take it—I speak with deference to the law—be subject to capture.

21. It has been suggested to us, and I think it was suggested to your Commission, that the granting of a national indemnity would affect, or might affect, in the opinion of Prize Courts, the nationality of the goods; and that therefore if you gave an indemnity on all goods the captor might argue that the loss would fall, not only on the nominal owner of the goods, but on the British Government under its indemnity; and that that makes the goods practically the property of the British Government and makes them liable to seizure, though had it not been for the indemnity they would not have been liable to seizure?—There is nothing a lawyer will not argue, and there is nothing which a probably hostile Prize Court will not decide if it suits them as a matter of policy. I am afraid I am one of those who think the canons of international law are liable to be strained if *force majeure* is on the side of those whose interest it is to strain them. Therefore, all I could say in answer to that objection which I have heard is this, that when all is said and done, supposing you give an indemnity and so much is captured as is likely to be captured, so long as we have a strong fleet and maintain our position as mistress of the seas I think you had better take it and do it, for the sake of the greater advantages of the freedom and safety of your population at home and your trade abroad. That is generally my answer to it.

22. May I ask you a question arising out of Scheme A paragraph 1. You will see that the suggestion there is that the indemnity should be confined to shipping registered in the United Kingdom; would you be disposed so to confine it, or would you extend it to all British shipping?—I do not know what would be involved, but I think there would be great jealousy and difficulty in discriminating. I should have thought that that was exactly one of the sort of questions which might be fairly put to our colonial fellow-subjects at any conference or anything of that sort which may take place. Personally, I do not believe in the greatness of the risk which we are asking the State to assume. I am prepared to give a calculation of it in detail hereafter, which may be useful. My own belief is that the overwhelming importance of making the Admiralty feel that they have everybody behind them in their policy would justify us going even to a greater risk than I think you are likely to do in the matter.

23. I gather that you do not think that the risks of fraud which would be incurred by the State are so grave as some of the witnesses before your Commission were afraid?—I suppose there is a risk, some people will try to make money out of us in any emergency, but I think that the penalty upon being found out would be so great if you take reasonable ordinary precautions, and public opinion would back you so tremendously in very drastic dealing with any person who did that sort of thing, that I would risk it. There is another objection, I do not know whether that was also in your mind, namely, that short of fraud, shipowners would be inclined to run what I would characterise as unjustifiable risks in the event of feeling that they were to be indemnified. I suggest to obviate that, which I do think is a risk, owing to the speculative and sporting instinct of the human race, that the control on the part of the Admiralty ought to be made very stringent. I think that a shipowner should understand that by telegraph or otherwise he was absolutely to obey the Admiralty as far as route was concerned, and that the Admiralty in these days of telegraphs should be able to give at very short hours' notice pretty good information as to where risks lay. It shows how far afield one is taken, but an ingenious person suggested this difficulty to me: Supposing the Channel was unsafe and you could not get to London through the Straits of Dover, and we wanted food from the West, I am putting the hypothetical case from either Canada or the United States, and the Admiralty said you must not go round the South of Ireland, but you must go round the North of Ireland, and you must take the Pentland Firth and come down the East coast of Scotland; supposing they encountered a storm in the Pentland Firth and the ship was wrecked; then the wreck of that ship in the Pentland Firth if due care in navigation was taken, would be a marine and not a war risk, but then that marine risk would never have been run except for purposes of war. Therefore I should be inclined personally, provided due care in navigation was exercised, to include that as a thing for which the man should be indemnified. But I gather from one paragraph in this scheme that whoever drafted it is inclined to take the contrary view. I do not think it is a very big point, and I do not think it is worth hunting at this particular moment. I only mentioned it to show that in studying the question, I have tried to go as far as possible into all the difficulties that were raised.

24. In order to protect the British Government against the shipowner running undue risks you would rely, as understand it, upon Admiralty instructions, compliance with which would be a condition of the indemnity?—That is my suggestion.

25. Have you considered in what way you would protect the State against unduly high claims? Assume that the risk was not an undue risk, and that the ship was properly navigated and so on, have you considered how the State should be protected against fraud—perhaps fraud is too strong a word—injury, I will call it?—On that point I admit that there is a danger to be guarded against, and it was very ably argued by Mr. Gow, who was a Liverpool underwriter. His evidence will be found in Volume II. of our Report and his memorandum in Volume III., page 234. One of the points of objection is that the ordinary marine insurance valuation would not be for the purpose of the war risk, because it is usually in excess of the actual value of the ship. He quite admits that there is nothing fraudulent about it, because it is done, as I understand, mainly for the convenience of the underwriters. I hope those who are interested in these things will feel that I am speaking with great diffidence and only from what I know from our enquiry. If anyone will look at question 10470 in Volume II of our evidence he will see the concrete case which Mr. Gow gives. He says that underwriters do not dislike a larger valuation than is absolutely defensible because they want to bring in a greater number of people to be liable in case of partial damage. The case he gives is, supposing

the real value of a ship is £30,000, they will not mind its being put in at £40,000, because they will bring in 40 people who take £1,000 each, instead of 30 people who take take £1,000 each, and then in the case of partial damage, which I understand is much the more common thing, the risk is more spread. But even assuming that a system of indemnity was chosen, I do not myself see any difficulty in ordering the shipowner who wishes to join in the advantages of it to take out from the Government Department concerned what would correspond to a policy in the case of ordinary marine insurance, and in doing it he might be required to hand in all necessary papers to establish the value of his ship, and the Department would have powers to call for further particulars, and would therefore, if they chose, have time to establish the value, at any rate very near the proper figure, before any question of paying an indemnity could arise. I ought, perhaps, to say that in studying this matter I was rather surprised to see in yesterday's *Times* a long paragraph about the marine insurance market which seems to controvert Mr. Gow's suggestion that ships are overvalued. The grievance there for the underwriters is that they are beginning to realise by painful experience that ships are under-valued, and that when they are totally lost they have to pay much more than they ought to do. I would like to call attention to this paragraph; but really the whole subject is so technical and difficult that I do not feel that I can be of the least use to the Committee about it. I should like to hand this paragraph to the Secretary; I have no doubt others round the table have seen it and know much more about it than I do [*handing in same*].

26. We may leave that point perhaps. I think you said just now that you had made some calculations which you were prepared to give the Committee as to the risks which the State would be running?—Yes, I did. The results are rather interesting. If you look at paragraphs 241 and 242 of our report you will see what we say about it. The conclusion is that if 1 per cent. of our shipping were lost the cost would be £1,800,000, if 2½ per cent. were lost it would be £4,500,000, if 5 per cent. were lost it would be £9,000,000, and if 10 per cent. were lost it would be £18,000,000. I am told that the complete loss of shipping in any previous war, so far as calculations can be made, was never more than 5 per cent., and Captain Mahan calculates that there was not 5 per cent. or anything like it of the Federal shipping taken by the Confederate cruisers. That paragraph has been a good deal criticised, and some people have asked for the details. I have in my hand the exact calculation we made, and it is as follows:—

Our total foreign trade in 1903 was:	£
Imports (from foreign countries and British Possessions) - - - -	542,600,289
Exports (to ditto, ditto, including both British goods and foreign and Colonial re-exports) - - - -	360,373,672
Total - -	902,973,961
or, roughly,	£900,000,000.

We assume that about two-thirds of this was carried in British ships, or £600,000,000; and we are justified I think in that because of the total tonnage entered and cleared with cargo in 1903 in the United Kingdom ports about two-thirds was British. The total British tonnage entered and cleared at United Kingdom ports in 1903 was 58,000,000 tons, and as the cargo carried was worth £600,000,000 (as estimated above), the cargo carried per ton of British shipping $= \frac{£600,000,000}{58,000,000}$ or about £10 5s. The total British tonnage engaged in foreign trade in 1903 was 8,900,000 tons, which may be valued roughly at £10 per ton, and we have already calculated that the amount of cargo carried per ton of shipping = £10 5s. Therefore the total amount at risk would be—

	£
Value of shipping (10 × 8,900,000) =	89,000,000
,, ,, cargo (£10 5s. × 8,900,000) =	91,000,000
	£180,000,000

For the other calculations at 1 per cent., 2½ per cent. and 5 per cent. it is a simple matter of arithmetic. I should add that naturally I am not making myself responsible for those figures lightly, but I got my secretary, Mr. Clark, of the Board of Trade, who is now private secretary to Mr. Lloyd-George, to go into it with the officials at the Board of Trade, and these are the details of the calculation on which we found those two paragraphs.

The Right Hon. Lord Balfour of Burleigh, K.T.

Dec. 1906.

27. I would like to put one question as to that calculation. You arrive at the total value of British shipping afloat, and you add to it the value of the cargo at risk at any given moment; but is not the value of the cargo at stake on which the Government risk would be run, not the cargo afloat at any moment but the total amount of cargo afloat during the year?—I think not, because some cargoes would succeed others. The voyage does not last the whole year.

28. But the ship is the same ship, and the Government can only make a total loss on it once?—Yes.

29. The cargo is a different cargo each voyage; one cargo might get through and the next voyage the same ship might fail?—So far as it goes it tends to minimise my calculation, because if you have only lost one ship you can only lose one cargo.

30. Is there anything you would like to add, apart from the specific questions I have put to you?—There is one thing referring to Mr. Gow which I think would meet his objections. I speak of Mr. Gow with great respect, because he was an extremely able man, he gave his evidence very well indeed, and he thoroughly understood the subject. On page 324 of Vol. III., he took this objection, that, if a system of national insurance or indemnity were adopted—and these are his words—"It is perfectly evident that the most hazardous voyages would be selected by shipowners for the employment of their vessels." He says that it is difficult for an underwriter to realise that any system of insurance could exist without proper "classification of risks"; in other words, I understand him to mean, where the same rate of premium (or, as in the case of indemnity, no premium at all) is charged for voyages where the degree of risk would not be the same. I may just premise the explanation by saying we did not go into all these things in our report because we thought they were beyond our terms of reference; but as this evidence was given before us and may be referred to, I should like to give what seems to me to be the answer. I suggest there is some confusion in Mr. Gow's mind as to the result of this in inducing shipowners to select hazardous voyages by preference. I suppose that he means they would do so because such voyages would be the most profitable, and would allow them to charge the highest rates of freight. What he seems to me to forget is that the principal element in war freights would be the insurance against war risks, and that, *ex hypothesi*, if that is to be borne by the State there would, so far as war risk insurance is concerned, be no reason why shipowners should charge higher freights in war than they do in peace, and the same factor, namely, competition, would keep their charges down. In addition to that, I see no difficulty in the Government taking powers to receive complaints from shippers of excessive freight charges, and, if that was to be substantiated, to inform the shipowner that he would forfeit his right to indemnity, or to exact some other penalty.

31. That would be a large extension of the Government's duties, would it not?—It would be an extension, and I only put in it for your consideration. I do not think the thing will arise, because if you presume the case that I presume, that the shipowner is to obey the Admiralty as to directions, the Admiralty can get out of the question of the hazardous voyages by simply saying to him, "We do not choose you to go there just now; we do not pay for it."

32. (*Sir George Murray.*) That is a complete answer to the objection from the indemnity point of view, is if not, that the Admiralty control will be absolute?—I think so.

33. I gather that you do not think there is any substance in the objection which has been raised, that a system of national indemnity would be a special protection for the benefit of a particular industry at the expense of the whole community?—My answer is, that the safety of the State is the supreme law, and if it is necessary to us to get in our food, that must be risked; but I do not think it would occur, because if I am right, and all our shipping would be kept at sea, the natural competition of one shipowner with another would keep down the freight to the point of just enough profit.

34. And the moment you include the cargo as well as

The Right Hon. Lord Balfour of Burleigh, K.T.

4 Dec. 1906.

the ship in the indemnity, does not that become a justification for making it a national charge?—That is the great justification. It is only done to get the cargo, and the ship is the mere means of bringing the thing we want.

35. Therefore it should not be represented as a special benefit conferred on a particular industry?—Personally, I do not think so.

36. Have you considered whether the indemnity should cover trade between neutral ports in British ships?—You are taking me very far into international law. I would rather leave that to the skilled members of the committee.

37. I am putting it as a question of whether the indemnity should cover that kind of trade?—I am afraid that I have run away with the idea that this indemnity is as useful to us as a much stronger fleet would be; and so long as we can keep command of the sea, I think the moral effect of the indemnity in making things go on as they would in peace time is so great, and the risk of real loss so little, comparatively speaking, that I would risk a great deal for the sake of having a uniform scheme.

38. Would your uniform scheme include voyages of British ships between neutral ports?—It would have to, would it not, as far as the ship is concerned; or else the ship would be laid up?

39. That, of course, is one of the arguments in its favour?—I would say at once that the importance of the cargo going between two neutral places is not so great to our people as that you should make our taxpayers pay for it.

40. Then you would not include the cargo on these voyages in the indemnity, but only the ship?—At the moment, as you are asking me over the table, I do not think I would.

41. The probability is that the cargo would not be owned by British subjects in that case, is it not?—If it is owned by British subjects, of course, it is liable to capture.

42. And would you think it ought then to be covered by the indemnity?—May I take refuge in saying that that is rather a technical point which I have not really considered?

43. (*Mr. Lindley.*) One question with regard to the number of tons entered and cleared at United Kingdom ports in 1903, which you mentioned as being fifty-eight millions. That fifty-eight million tons would probably include, say, one ship coming in half-a-dozen times over?—I think so.

44. Therefore if any calculation is to be made with regard to the value of the shipping, that would have to be considerably reduced?—I think so. I would like to suggest to the Committee that they should not take these figures upon my reputation or credit. I only put them forward as being the details which seemed to justify our estimate. If the Committee think of going into the question, I should assume that, as a matter of course, they would call for their own estimate of the risks which the public were going to be asked to incur, and that they would have the command of the most recent figures at the Board of Trade.

45. The same remark, of course, applies to the amount of British tonnage engaged in foreign trade?—Certainly, that would be so.

46. (*Mr. Jackson.*) You mention that one of the conditions of the indemnity or insurance would be the strict observance by the shipowner of the instructions he would receive from the Admiralty; that would put the cargo, would it not, in a very awkward position, supposing for argument's sake the shipowner or the captain of the ship did not observe the Admiralty instructions?—I go back there at once and say that the shipowner must look after his own servants.

47. What about the cargo?—In course of time it would obviously work its own cure, because if a shipper found that a shipowner could not control his servants, and they would not do what they were bid, he would go to another shipowner.

48. But then the cargo would be lost already, would it not?—I can say in answer to that that if the cargo owner is perfectly innocent, if he has done his best, and taken all the precautions that he can, then I think he should get his indemnity. I do not think you should penalise a man unless it is his own fault. But if you find that the same cargo owner and the same shipowner were often having their servants running these sort of risks, I should strike them both off ruthlessly, because, after all, this is for national safety and not for the profit of an individual.

49. I take it, therefore, you would be of opinion that the owner of the cargo who is not responsible, who has no control over the shipowner or the captain of the ship, should be indemnified, even if the captain and the shipowner did not observe the Admiralty instructions?—I should certainly allow a first offence, but if I found a cargo owner repeatedly, say two or three times, coming for the same sort of indemnity for the same sort of cause, disobedience of regulations on the part of others, I should be inclined to take a rather severe view of him.

50. You said, I think, that you considered that imports coming in British ships would be considered as British cargo?—I did suggest that and put it forward.

51. Supposing it were argued that it was not British-owned cargo, would you still extend the indemnity to it?—I think so. Take the case of wheat. Supposing we were bringing wheat from America, there might be a point as to when the wheat became subject to capture, and when it was transferred to the ownership of the British subject from the American wheat merchant. I should indemnify for this reason—that after all we want the wheat, the overruling thing is that we must have it, and we cannot allow our people to starve while the question whom the wheat belongs to is being discussed by the Prize Court.

52. You would also apply that to exports from this country, would you not? You spoke of the expediency of indemnifying exported goods; do you not think that the same argument would apply there too? After all, we wish to keep our export trade also in full swing; do you not think therefore that indemnity should also be given to the owner of those exported goods as well as to the owner of imported goods?—Personally I do, subject to this—that if you get the name of piling up all that you are going to pay for, regardless of the feelings of the people who are going to pay for it, you may break down the whole scheme by the argument that we are running undue risks, and you may set people against what I believe to be a good scheme. If our calculations are right, that the real probability of capture is so small, as I think it is, then I think it would be better to take that risk rather than lose the export trade. I am tempted to refer to the paragraphs in the Report which attempt to argue the question of whether steam as against sail has not increased the chance of escape. Personally I think it has increased the chance of escape, and I set out the reasons there which influence my mind. They are the result of communications made by the Admiralty.

53. Although I do not wish to draw you into technicalities which you rather feel that you should not be taken into, may I carry that point a little further? You expressed an opinion in answer to Sir George Murray, but you gave it only as an expression of your personal opinion, that the insurance of cargo carried in British ships between two neutral ports should probably not be covered by the indemnity?—Yes, I did; on the assumption that the cargo in all probability would not be British-owned.

54. Is it not possible that a great deal of the cargo which goes between two neutral ports is eventually destined for the United Kingdom, and would it not be very difficult to define it so as to differentiate in any way between the two?—It may be so, but that is a question of exchange of trade on which I should not like to express an opinion.

55. Would it not also to a certain extent lay up those ships which were trading between those two ports?—Yes, except that if they could not trade between those two ports they would enter into competition to trade between British ports with British goods, and that would tend always to keep down the economic rise of freight which might be caused by the absorption of some of our shipping for war purposes, that is, for our own transport purposes.

56. (*Captain Ottley.*) What I understand from what you have told us already is that you are quite of the opinion that some form of national guarantee is desirable?—That is so.

57. And you have gone further than that; you have said that in your opinion the advantages of indemnity are very much greater than the advantages of insur-

ance, and therefore you think that indemnity pure and simple is the better scheme?—I think so.

58. I should like to go on, on that assumption, to ask you whether our scheme of indemnity or insurance, whatever it may be, should not be such as should give us what we want at the minimum cost to the taxpayer?—Clearly. I have enough sympathy with the Treasury to answer that at once in the affirmative.

59. Arising out of that question I should like to ask whether in your opinion, if the State made a guarantee of the kind which I am going to state directly to the shipping community at large, including the underwriters, the insurance agencies and the owners of ships, such a proposal as I suggest now would be sufficient to keep our shipping and our cargoes at sea. The proposal I suggest for your consideration is that the State should say frankly to the whole shipping community, We are prepared to pay every *bona-fide* loss on a ship that is lost, either captured by the enemy or driven on shore by the enemy, and on the cargo that it contains, so far as that cargo is liable to capture—in other words, so far as that cargo is British-owned. I ask you whether you think that such a guarantee as that would be sufficient for the purpose in view? I suggest for your consideration that if possible it would be a most enormous advantage to us from the economic standpoint if all the other subsidiary risks were thrown to the winds, or rather were left to be insured against between the insurance agencies and the shipowners themselves?—May I ask what you mean by "all the other subsidiary risks"?

60. I think I should describe demurrage, for instance, under that head, and loss of markets, by having to diverge, and so on. What I ask you to give your opinion to the Committee upon is whether you think if the Government took the larger risk, that is the risk of capture, that then the subsidiary risks which would be left to underwriters and insurance agencies would be of such a comparatively small amount as to enable our shipping to continue running in war without being driven off the markets by neutral competition?—If I was quite sure that it would be comparatively small I should answer your question in the affirmative without qualification, because I am one of those who are extremely anxious to leave everything that is possible to individual action rather than to State action. I always think, if I may say so, that there is a strong presumption against State action if you can get the individual to do it. The only qualification I make is, are you sure that these other risks will be so small that the risk of demurrage and of the other things will not be put in by the insurer at such a premium as will tend to defeat the real object you have in view, which is to cut away from the alarmist people any excuse for saying the Navy is not big enough and you must spend another million a year on the Navy? It is not certain that we shall be able, under all circumstances, to avoid a disaster everywhere. I suggest this particular idea of an indemnity as the cheapest method of getting rid of war scares.

61. I quite understand that you would give an unhesitating affirmative reply to the proposal that the State should limit its insurance to the actual net capital loss on a ship and its cargo if the indemnity offered by the State was sufficient to keep the ships at sea. If the Government took this large capital risk, namely, the risk of a large loss of capital due to the destruction or capture of a ship, and the destruction or capture of the cargo, the question for the experts is then whether, if the State took that, there would remain risks of so serious a character as to make it practically impossible for British shipping to keep at sea?—That is, of course, a point of difficulty. Our double object is to keep the ships at sea and to get the stuff in, and my test of the efficiency of your scheme is whether it will really produce such confidence in the ship-owning and cargo-owning mind as will make things go on during war as near as possible as they do in times of peace.

62. Will you assume for the moment that there is that case which I have stated, and it is agreed by experts to be a sufficiently good one? The insurance agencies perhaps would tell us that whereas in any individual case the war risk would be 5 per cent. upon ship and cargo, when you have done away with the risk of actual capture or actual destruction it would fall, we will suppose, to 1 per cent., which perhaps the experts would tell us is a sufficient fall in the rate of insurance to enable British shipping to compete. What should you say upon that?—If your hypothesis is correct, I should say yes, but you must make sure that your hypothesis is correct.

The Right Hon Lord Balfour of Burleigh, K.T.

4 Dec. 1906.

63. I agree. We have just had in the Intelligence Department of the Admiralty a most interesting case of insurance very much on the lines of the alternative scheme to yours—the scheme which, I quite understand, you do not advocate. The Admiralty, in point of fact, took advantage of a huge insurance policy for £10,000,000 to insure the shipping which took part in the naval manœuvres this year against not actual war risks, but against some of the risks which were inherent in the manœuvres which took place during this year. In effecting that insurance we found that the difficulties were very great. We found that whereas concrete cases which could be settled by the Admiralty themselves without going to the insurance agencies were easily settled; one particular case occurred where a ship diverging from her course came into collision with another vessel. This risk, we were told, was part and parcel of the manœuvre risks; and that one single case which has had to be settled by the insurance agencies has absolutely defeated the purposes of the Admiralty at the present moment, and we have not been able to carry it out. We think, as arising out of that, the difficulty of insuring the whole of the British mercantile marine will be an enormous one, and we want if we can to avoid that. I would ask you first whether you think it would be possible for the Government to merely make this announcement to the mercantile marine at large in time of peace, We will indemnify you against the risks of capture and the risks of destruction, but against no other risks; and then do you think if that were done it would be possible to let the insurance agencies and the underwriters and the shippers, as between themselves now in time of peace, to settle upon the forms of insurance policy for the remaining war risks? Would that be a practicable scheme?—I do not see how you can divide war risks into two classes without great risk of dispute and difference of opinion. If you are to get into an argument between the Admiralty (or the Treasury or whatever Department it is that has to pay) and the private companies that have insured, I am afraid the Government will come out second best, and great delay will occur. I do want to press this point very strongly, that one of the chief advantages of such a scheme as generally is put forth in these papers seems to me to be that you would have great promptitude of payment. I am certain that the shipping community will value immensely great promptitude of payment, instead of having to fight and haggle over the claims. They want to get on with their business, and they want to put out their money again in a way to earn a profit upon it, and if they have to fight technicalities of claim I am sure that will defeat the object.

64. That rather brings us back to the position which the Admiralty have already taken up. The Admiralty find that where the question has to be settled outside the Little Claims Committee (it seems to me that it would be so under all the schemes we could have), the moment these claims have to be settled outside the Little Claims Committee you get all these delays. The Admiralty, I feel sure, would like to ask you whether you think this concrete loss, the loss of the ship and cargo, would be sufficient?—I do not like to express an opinion further.

65. (*Chairman.*) In answer to Sir George Murray you used the phrase, I think, that you regarded a scheme of indemnity of this kind as being as useful to us as a much stronger fleet?—Yes, I did.

66. I am not certain whether I rightly understood that as being explained by a later answer to Captain Ottley, in which you suggested this as the cheapest method of meeting scares?—I will put it briefly in this way, that I think unless the fleet is maintained at what I call and suggest is an extravagantly high rate compared with others, you will be liable from time to time to scares on the food point, because at certain seasons of the year the supply of food in this country gets down at its worst to merely enough for six or seven weeks, that is generally in June, July, or August, just before our harvest. It does not do so at other times of the year, but you will be liable at times to this sort of panic. Of course, I am now going very far into policy, but it seems to me that it is bad economy to be raising and lowering expenditure by

The Right Hon. Lord Balfour of Burleigh, K.T.

4 Dec. 1906.

the Admiralty in consequence of these sort of panics, which no Government can always very well resist.

67. At any rate, your answer pre-supposes the existence of a sufficiently strong fleet?—I start on the assumption that that is what underlay the reference to me, that the fleet is to be strong enough in the opinion of our advisers to maintain the command of the sea. It is not to be, as I understand it, so strong as that we are never under any circumstances to expect a single ship to be captured; but it follows obviously that if our fleet were mastered there would almost certainly be a scare. That is argued very fully in the Duke of Sutherland's and Mr. Chaplin's Reservations from our Report. I do not mean so strong a fleet as that we are never to suffer a reverse under any circumstances, because if it were to be so we should never be able to take a forward policy for fear of a reverse; but, generally speaking, I should say strong enough to maintain the command of the sea.

SECOND DAY.

Tuesday, 11*th December* 1906.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Captain C. L. OTTLEY, R.N., M.V.O.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. FREDERICK HUTH JACKSON.
Mr. ARTHUR LINDLEY.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. THOMAS GIBSON BOWLES, called and examined.

Mr. T. G. Bowles.

11 Dec. 1906.

Mr. Bowles, in a preliminary memorandum,* had submitted:—

(1) That the apprehension that in war British merchant ships would be driven off the seas, and would be transferred to neutrals, that freights and insurance would rise, that supplies of food and raw materials would be stopped, and that a rise in prices would result, originates in the second Article of the Declaration of Paris (1856). It is assumed that the Declaration of Paris would subsist in war.

(2) That the decision of the Privy Council in the "Baltica" case is conclusive in showing that there would be no legal difficulties in the way of transfers from the British register.

(3) That the need for a National Indemnity is a question of prices.

(4) That specific wars with specific single States must be considered separately in order to test the need for an indemnity, and that the conditions that are to be expected in the case of war with the United States, France or Germany, deserve special consideration.

(5) That the apprehensions that freights, insurance and prices will rise, and that British vessels will therefore be transferred, do not consist with each other, since if freights rise, British vessels will not be transferred, and if vessels are transferred freights will fall.

(6) That a rise in freights does not necessarily mean dearer food, and that prices in general do not necessarily rise in time of war.

(7) That indemnity would only mean a transfer of the burden; that war premiums are not always exaggerated; that it is less equitable that the taxpayer should pay the cost than the consumer; that the rise in prices will not be prevented; that the mischief of free ships, free goods will remain; and that indemnity will not prevent loss, but encourage it.

(8) That the annual charge for the naked war risk on 1 per cent. of losses would amount to £28,000,000.

(9) That an increase in the Navy would be more effective than an indemnity.

(10) That a State Indemnity Department would be inadequately worked, and liable to be defrauded.

68. (*Chairman.*) You have given considerable attention, I think, to the laws of maritime warfare?—I have.

69. And you have formed very strong opinions upon the subject?—Well, definite opinions.

70. I need not tell you that we are not empowered to consider such questions as the wisdom or otherwise of our Government having acceded to the Declaration of Paris; we are only concerned with the effects of war under the present international position?—I quite understand that.

71. The suggestion which has been referred to our Committee is that the State should make good to British shipowners and shippers the losses which they incur in war when their own State is a belligerent. I think that is a comparatively novel suggestion, is it not?—It is quite novel, I think. Hitherto it has been held that all the loss the subject incidentally incurred whether of his property or of his life, through the existence of war, must fall upon him. If a man were a citizen of a bombarded town, and were killed by an enemy's shell, or if his property were devastated by that shell, it has always been understood to be his loss, which, as a good citizen, he must hold to be his own as a sacrifice to the State. This suggestion, therefore, I think is quite new.

72. The suggestion is that under the conditions of modern warfare there would be a great danger at once of the transfer of British shipping to a foreign flag, and, partly as a result of that, of a great rise in

* *Vide*, note p. iii.

freights, and, consequently, in the price of food and raw materials. Have you been led to study that question?—Yes. The question of the transfer of British ships in case of war to a neutral flag arose really the moment the Declaration of Paris was signed—in 1856. Previously to that Declaration a British ship was just as safe or as unsafe for British goods which were enemy goods as a neutral, and the goods were equally liable to capture under either. Therefore the question of the possible general transfer only arose when it was agreed that the neutral flag should cover the cargo; that immediately gave a very great advantage to the neutral ship in case of war.

73. We are obliged to assume, for the purposes of our inquiry, that the Declaration of Paris will remain unaltered?—I quite accept that situation. I understand it is the position that the Committee takes up.

74. What, in your opinion, is the danger of transfer?—I have ventured to give you a paper which I have written which really contains the whole of my considered views upon this subject. I have been down in the country, being one of the unemployed, and I have been able to give considerable attention to it. I have gone very thoroughly into it. That paper really represents the whole of my view. With regard to the possible transfer of English-carrying ships, merchant ships, to the neutral in time of war, I must begin by saying that this word "war" is used in far too general a sense. People talk of war—some of them—as though we were to be at war with the whole world—a thing which, I think, never was possible for long with England, and which is less possible now than it was at any time. England never was at war for more than six months or a year without drawing to herself allies; and the probability that that would be so is greater now than ever it was before, in my opinion. But even if I am wrong there, you must consider what particular war you have in your mind. Wars differ infinitely, and that which would be a great danger in one war would be of no danger at all in another. If you were at war with Greece—I am repeating a good deal that will be found in my paper—if you were at war with Venezuela, or if you were at war with Turkey, in my opinion there would be no danger whatever of any transfer of British ships to a neutral flag, because of the danger they would be under from the enemy. But if you were at war with other Powers, the thing might be wholly different. I conceive, therefore, that before I am asked, or anybody can be asked, to say what the danger would be of the transfer of English ships to neutral flags in time of war, I must be told what war you mean. In the consideration I have given to the subject I have ventured to go into the question of certain different wars. I put aside as a determining cause for the transfer of English ships almost all the Powers of Europe. If you were at war with Austria, I do not think there would be any danger of any transfer of English ships to neutral flags; there would be very little with Italy; there would be a very great deal with France; there would be enormous danger in the case of the United States; and there would be a very considerable danger in the case of war with Germany. So that you see my answer must be special. When I am asked what I consider is the danger of this transfer I must make it depend entirely upon the particular war. This much I will say: That I think the danger of transfer has been represented as greater than it is, and I think it has been dealt with too generally—that is to say, gentlemen who have spoken of it seem to have had in their minds war in general, and preferentially war with the whole world, and they have assumed the danger to be equal always. I think there is a great danger in certain instances; but even in those I do not think it is so very immense, nor would it be so very fatal as many persons think, or as even I myself had thought before I came closely to the subject.

75. Perhaps you could make your views on the question of the risk clearer by taking one or two specific cases and developing them more fully?—That our merchant ships would in fact be largely transferred to neutrals on the outbreak of any war whatever is to me inconceivable. That they would be so transferred in the case of a war with any important European power, which I think is what the Committee of the House of Commons of 1860 suggested, say with Austria alone, with Italy alone, or even with Germany alone, is in my mind unlikely. That such a transfer would, however, be made in the case of a war in which the United States or France were among our opponents is more than probable. First of all I perhaps may deal with the difficulties that have been suggested in transfer. I think Professor Holland rather suggested that the difficulties of transfer would be so great as in themselves to be a bar to such a transfer. I think that is entirely untenable. The legal difficulty does really not exist. The Privy Council decided in the case of the "Baltica" in the Russian war that a good transfer was made. Now the "Baltica" left Libau in war and went to Copenhagen and was transferred during her transit while she was on the seas, *flagrante bello* as they call it—in an open state of war. She was taken in possession by the neutral to Copenhagen, was sent to England, and was captured on her way. The Privy Council ordered her restitution on the ground that the transfer was good. I am speaking from memory, but I believe I am accurately representing the case. The legal difficulty does not really exist. As to the financial difficulty it has been suggested that it would be difficult for people to find the money to buy all these ships. But the transaction would finance itself on the supposition that is made, because the supposition that is made is, here is a great trade to be done, the ships which ordinarily do it are laid up through being unable to sail under the belligerent flag, and they are to be had cheap. Therefore there would be no financial difficulty whatever. In adition to that there is this fact—I am still on the point of difficulties—that this very transfer was made in 1898 by the United States. I read in Mr. Wilson's book, "The Downfall of Spain," that on the outbreak of war the insurance rates on American vessels ran up as much as 50 per cent., and that for a very special reason, namely, because Spain had not signed the Declaration of Paris, and therefore was able to send out privateers. The Americans consequently felt that there was a special danger to their ships from Spain, because although Spain had not great naval power she might send out quasi-naval ships, privateers, which, by the way, are really public ships, as they carry a public commission, and so forth. The insurance on American vessels, as I say, ran up to 50 per cent.; and then Mr. Wilson points out that a considerable proportion of the American vessels were taken into the Government service as auxiliaries of some sort—transports, and so forth. Then he says this: "The few ships of the American lines running to Europe were transferred to a foreign flag, the Belgian." I submit that there is no legal difficulty, that there is no financial difficulty, and that, as a matter of fact, there is no difficulty at all, as shown by that immediate transfer of the American liners to the Belgian flag. It is quite clear, I think, that this Committee owes its existence to the assumption that our vessels could be and would be so transferred in time of war. The suggestion is that the British ship could not continue running, and that she would consequently have to be transferred, and that, as a result of all that, freights would rise, insurances having already risen and determined the transfer, and prices would rise. I think that must be the assumption, because on the contrary supposition there is no case for a national indemnity. If British ships were not transferred—if they continued to be run as usual, and, as usual, brought up supplies—there would be nobody to indemnify. If they do continue running it must be because they continue to get cargoes. If they continue to get cargoes, it must be that both the ship and the cargo feel that the risk is not so great as to prevent them from facing it. So I respectfully submit to this Committee that it does follow that this Committee is investigating the matter on the supposition that that transfer will be generally made. But at the last what does it come to? It is not the transfer that we should mind, if it did not affect prices, nor the rise in insurance if that did not affect prices, nor anything else. Assume that the gravest apprehensions of the most timid person have been realised, and that our ships were transferrd in whole or in part, owing to the insurance, and all that; that would not affect us, nor, I submit, would it affect the final thing this Committee has in view, if prices did not rise. Prices is the whole question.

76. Not quite the whole question, is it? It was the

Mr. T. G. Bowles.

Mr. T. G. Bowles.

11 Dec. 1906.

whole question before Lord Balfour of Burleigh's Commission on the Supply of Food and Raw Material in Time of War, you may say; but the question of the loss of the British mercantile marine by transfer is a distinct question. Suppose prices did not rise, that freights were not proportionate to the risks run under the British flag, and that therefore the vessels were transferred to neutrals, but the goods still came in and prices were still being kept down, yet the British mercantile marine might have ceased to exist?—Certainly. If this were a Committee to consider a special indemnity for shipowners there would be something to be said for indemnifying the shipowner, even though nobody else required indemnification. But I understand the scope of this Committee to be wider than that. I understand it to be really to deal with a national loss, and not with a loss of a class of merchants or of shipowners. The picture presented to my mind, in short, after reading not only the whole of the evidence before the Royal Commission, but the suggestions that have been made, is that of this country, being in a state of war, receiving all its supplies undiminished, and consequently, I assume, necessarily at the same price. "All its supplies undiminished," and "no diminution," I think are the terms used by the Royal Commission. There will be the same supplies, the same prices, but a great feeling of apprehension, which it is desired to meet by national indemnity. I, for myself, cannot conceive that on that assumption there is a great case for the indemnity. It seems to me entirely to resolve itself into a question of prices. If you have the same prices, it does not seem to me a right thing to deal with the scare that might arise from an apprehension of a rise in prices. Therefore I submit to this Committee that it is at last a question of prices. If freights are not likely to be doubled or trebled, nor prices likely to rise to the famine level often predicted, the gravity of the question is greatly lessened. If they are not likely to rise greatly or for more than a short time, the question becomes of small importance compared with those other questions that every war must raise. If they are not likely to rise at all, it becomes of no importance whatever. All this, again, as I have said, resolves itself into the question of whether we shall get our supplies practically undiminished, for if we do prices cannot reasonably be expected to rise. Price, therefore, in my view is the final point. Now we have to ask whether war would stop our supplies of food or raw material; whether, either through captures by the enemy or by the laying up of our own ships or their transfer, the war would so diminish our supplies as to cause a distressing rise in their prices; and whether in that case national indemnity is a good way of meeting it. To every one of those questions I think it right to tell the Committee that, in my opinion, a generally negative answer must be given, although with important exceptions. Here again I come to the war. The case will vary with every war, and we must ask, therefore, what war? Here again another *caveat* has to be made. For nearly a century we have not known what real war is—war which put a stress upon us which involved our lives and our fortunes. Such a war has not been known since the end of the great French War. When we did know such a war we waged it under the old conditions, which exposed to our naval power the whole of the sea-borne trade of the enemy, which made a British ship carrying British merchandise as safe, or as unsafe, if you please, as a neutral ship—at any rate, put the two upon the same ground, and therefore as yet unexposed to the special risk now imposed upon it. These old conditions of war, in fact, resulted, after 20 years, not in any loss of British shipping or trade but in the doubling of both the shipping and the trade, while the shipping and the trade of the enemy were lessened by two-thirds, and for the time ruined. The experience of our next war will be different. It will be waged under new rules. We are therefore—and this is my excuse for any uncertainty there may be in my conception of the circumstances of the next war—mainly reduced to conjecture in seeking to determine what the state of things will be under the new rules. Now as to the word "war." As I have already said, it is spoken of very vaguely and very generally, as though it implied war between Great Britain and the whole of the world at once. That I think is quite inconceivable, and history shows, and the present political pressures and necessities and conditions show, that England would never long be at war without having an ally at her side against her enemy, whoever that might be. Therefore that is the first qualification. It will not be war against the whole world, and it will be a war with a strong probability of an early ally. I have got to imagine a war, and that I conceive for these purposes must be imagined to be a war with one single considerable State. There are, of course, other things which we must reject. There is the probability of its effect in gaining allies to us. Great as that is, it must be left aside I think. Then there is the further effect of the war in bringing upon us a land war on our vast frontiers in India and in Canada. That, I think, for these purposes must be left aside. I therefore am driven to conceive of a maritime war alone waged with a single State of such importance as would raise these questions. If the Committee has done me the honour to follow me it will see that I have gone upon a process of eliminating everything but that which will really raise the question before us. When this is done, I think we may perhaps arrive at some forecast. I exclude the smaller States, such as Greece, or Venezula, or even Turkey. I exclude also Russia, Austria, and Italy, because none of those would really raise this question in an acute form. Then, on the same ground and on other grounds, too, I exclude Holland, Denmark, Norway and Sweden. We must exclude Portugal because Portugal is inconceivable as an enemy; we have guaranteed the whole of the Portuguese possessions not only in Europe but over the whole world. Belgium, too, necessarily must be excluded because we have guaranteed her neutrality. We are left then with three principal Powers to consider—the United States, France, and Germany. I think that those wars would differ vastly in their general effect and their special effect as regards the transfer of British shipping. War with the United States, to my mind, would be by far the most serious of all. Their enormous sea-board, full of splendid ports on two oceans, their enterprise and ability, and the fact that they are not bound to the Declaration of Paris, which therefore would enable them to send out privateers under the old plan—the very reason why they refused the Declaration may be taken as a mark of their desire to preserve privateering—all those would give them great power against our carrying and carried trade. They could commission privateers under the old form, and they could capture British goods under the neutral flag. We, being bound, as they are not, by the Declaration could not retaliate by capturing American goods under the neutral flag, because, although we are not bound as towards America, we are bound as towards all the neutral Powers.

77. Are you bearing in mind the practice of the United States in the Spanish-American war?—Completely.

78. My impression is that though not bound by treaty, they did bind themselves by declaration on the outbreak of the war to act as if they adhered to the Declaration of Paris?—Yes; they waived the right for the duration of the war, but they maintained it. So did Spain. Both maintained their position as non-signatories of the Declaration of Paris, but both separately declared that for the moment they would waive their right. In the case of Spain, the temporary waiver was accompanied by a declaration of the permanent maintenance of the principle of the right to issue privateers. But to return to America. The United States if at war with us could capture English goods in a Belgian ship, but Great Britain could not capture American goods in a Belgian ship, because she is bound as towards Belgium, and also because at such a moment when at war with the United States England would certainly be looking for allies, and if any such ally was to be found it must be among the neutral States. Therefore England could not practically, in my opinion, exercise the old right of capturing American goods under a neutral flag. This, therefore, would give the United States, as I think the Committee will see if I have made myself clear, a stupendous advantage against England in a maritime war. That is why I think a war with the United States would be by far the most serious maritime war that we could face. But even that war would not stop our supplies. No war with any nation could stop the supplies coming to these islands—the avenues are too wide, as I shall show you a little later on. To come

back, this war would be the most serious, in my opinion, that we could engage in; and I am glad to see that, in the opinion of the experts at the Admiralty, this war is considered highly improbable. The Admiralty have given up all its stations on both sides of North America, and I conceive that is an indication that whatever other war we may fear, we need not fear one with the United States. Then I want to mention in passing the possibility of a war with Spain, only because in respect of the law of nations Spain would be exactly in the same position as the United States. Spain also is not bound by the Declaration. Spain also, therefore, could issue privateers. Spain also would have the right to capture our goods under the neutral flag, and we could not capture hers. But Spain has not the resources nor the energy of the United States, and Spain, therefore, I do not regard as a very serious enemy, although she would become one if she were in alliance with an astute enemy like the Germans. She would become then a very serious and formidable adversary on the seas. She has a splendid coast-line and beautiful ports, and she has these legal advantages. As the Committee will see, I have only spoken of Spain in order to dismiss her. There are great possibilities in a war with Spain in which Spain should be directed by an astute ally; but war with Spain alone I think may be dismissed. Then I come to war with France. War with France would be the next most dangerous war for us after that with the United States. She, too, has a grand sea-board on the Atlantic and on the Mediterranean. She has beautiful ports, splendid ports, although none on the Channel, none, indeed, until you get to Brest; but still from there there is a succession of magnificent ports in both seas. Then she has an unbroken and very fine naval tradition to which I, for one, attach the very greatest importance. To my mind Germany has no such fine naval tradition as France has, or as England has. But France has that tradition, and she, therefore, would be a very formidable antagonist at sea. But here again, for other reasons, I think a war with France, quite apart from the present *entente*, highly improbable. France has two things which prevent her, while they exist together, from going to war with anybody except for the defence of her territory. She has got universal military service, and she has got universal suffrage. The man that votes, therefore, is the man that has to fight—the same man. He therefore always votes against fighting; and I do not believe any French Ministry could live a fortnight that went to war for anything else than the defence of the territory, unless, indeed, there was some unexpected and certain chance of getting back Alsace-Lorraine, in which case the thing would alter.

79.* In the case of a war with France, would you distinguish as to what part of our imports would run risks?—Yes. There, I think, as I shall endeavour to show to the Committee, there would be no closing of our doors. In case of war with France, certainly the price of wines, silks, fancy goods, and all the fancy things that we get from France would rise, but I see no probability of a rise in the price of food or of raw material generally. Then I come to war with Germany. That I put third in importance for many reasons. Germany has not above 200 miles of sea-coast on the ocean; her other 800 or 900 miles (I suppose) on the Baltic is a very bad sea-coast, and is behind the Sound or the Kiel Canal, which comes into the sea, as the Committee know, in the Elbe, and therefore that is one door. Her coast-line is small, her ports are bad, and they are few; and that is very important. In addition to that, the German Navy, though it is very formidable in numbers and in equipment, and the men are well trained, still lacks what is essential to a navy—naval tradition. They have none of the old seamen traditions, and in my opinion it takes a long time in order to form those. If Germany were doubled with Holland she would be doubled in importance without adding materially to her fleet, because then she would have that grand Dutch nation incorporated with her, with all their seamanlike qualities and traditions. Germany with her powerful and growing Navy admirably equipped is still deficient in the slow-growing naval and seamanlike traditions; but her future is said to be on the seas. She has claimed the trident—the trident must be in her fist we are told; and she has claimed the Admiralty of the Atlantic. In addition to this, I cannot avoid seeing that all the recent redistribution of our fleet tends to a belief that there will be a danger to us in the North Sea which did not previously exist, or which, if it did exist, has become greater recently. Since, therefore, I have got to imagine some specific war, I take war with Germany, a war single-handed, the rest of the world remaining neutral, and a war which might last three, four, or five years. As I have already said, if Germany were doubled by Holland, then, indeed, the case would be very serious; then I should put the two on a level with France; but Germany alone I consider comes third. What is going to happen to us in the case of a war with Germany? I do not believe myself that there would be a great transfer of British ships to the neutral flag in case of a war with Germany. This is one of the curious things, that although privateering is declared to be abolished, it is not abolished, because it has been revived under the form of an auxiliary fleet. In the war of 1870 the Prussians formed an auxiliary fleet, and the Russians, as you know, have formed an auxiliary fleet, and in no essential particular would the vessels or the officers of this auxiliary fleet differ from privateers except in this, that they would be commanded by officers nominally as well as really naval officers. That is the only difference, and in all essentials they resemble privateers. They, like the privateer, must have a commission; they, like the privateer, are public and not private ships; they, like the privateer, bring in prizes which, as in the case of the privateer, enure to the Crown of the country, and may then be distributed as a reward to their crews in any proportion that may be determined. Therefore we shall always be exposed to privateering under its new form, the auxiliary fleet so called. It has always been one of my objections to the Declaration of Paris that we did not get the price supposed to be paid for it, which was the abolition of privateers. But they would not hurt us much with that, for the reason that I have already stated. They have a small poor coast-line with few ports, which on the whole are bad ports—ports which we could I think watch without a great deal of difficulty. I do not believe myself that even in the modern form their privateers would do us much harm, nor do I think their cruisers would. The Admiralty has I am sure very able strategists, and I conceive that one of the first duties of the Admiralty would be to have its eye upon every dangerous German cruiser all over the world—it has its eye on them I suppose at this very moment—and to be ready on the outbreak of war to hunt her down, run her out of coal, capture her and dispose of her finally by one of our cruisers. I venture to say that if the Admiralty does not do its work—and this is an essential part of it—and if it is found at any time that it has not done its work, I hope it would not be an Admiral but the First Lord that we should hang this time. I have dealt with the direct danger of the capture of our merchantmen. Now I come to the other danger of the stoppage of our supplies through fear of capture or hindrance of some sort. I boldly say that it is impossible to stop the supplies of this country. I say that the avenues through which these islands are approached are so large and so numerous that the whole navies of the world could not stop them. Nature protects us. The great avenues of approach to the British Islands—I call them avenues, but they are more than that—are wide indeed. From Norway to the Orkneys is 300 miles. From the Orkneys to the northern end of Ireland is 350 miles. From the northern end of Ireland to Cape Clear at its southern end is 300 miles. From Cape Clear to the Scilly Islands is 150 miles, and from the Scilly Islands to Ushant is 100 miles. This makes altogether 1,200 miles of sea, every mile of which must be stopped before you can prevent access to the British Islands; and that is the shortest line you have got to watch, observe. I therefore feel perfectly certain that whatever the war is—and I am now on a war with Germany—under no circumstances in any war whatever could access to these islands be effectually stopped. With a British fleet of preponderating strength on the sea and with moderately capable strategists at the Admiralty, even so much as any serious interruption of seaborne supplies is in the war supposed, war with Germany, almost unthinkable.

80. You would admit, would you not, that a very small percentage of loss might produce a very great result upon price?—No, I think not. I think a very small loss would produce a very immediate and startling effect upon the rate of insurance, but as

Mr. T. G. Bowles.

11 Dec. 1906.

Mr. T. G. Bowles.

11 Dec. 1906.

soon as the vessel that had captured or sunk ours was captured or sunk by one of our cruisers, the insurance would fall like a stone again immediately. Price, I think, would not be affected by a few small captures.

81. Let me put my question in another way. A very small shortage in supplies would send up the price out of all proportion to the extent of the shortage, would it not?—It might for a certain time. I confess I do anticipate that there would be a jump up, but there would be an equally quick jump down. After all we are dealing not with a week or two or a month or two, but with a year or two rather. In the year or two, I submit, that if the supplies are not diminished the prices on the whole will be unaffected. As you know, in time of peace prices vary; and they vary from an infinity of circumstances. Now we come to the protective power, which I venture to think is the most important of all considerations—the Navy. I expect the Navy to do its duty, and I believe that it is equal to the doing of that duty. I anticipate that if war were to break out with Germany, in a fortnight's time we should have got hold of every German cruiser that could in any way affect our commerce, or made her harmless somehow or other. Therefore, as the Committee will see, I neither believe that any of our supplies could be interrupted, nor do I believe that in the war that we have under consideration, war with Germany single-handed, such an effect could be produced by the Germans, either by means of the new form of privateer or by means of their cruisers, upon our seaborne trade as to necessitate a general transfer of our ships to the neutral flag. I may be wrong, but that is the conclusion that I have come to myself, and I believe the actual experience of actual war will bear it out.

82. So that your conclusion on the question of transfer is that there is no serious difficulty in the way of transfer?—Yes.

83. But that on the other hand it is almost inconceivable that circumstances should produce such a transfer?—In the case of war with Germany. But I make a difference. In the case of war with France or the United States I think there would be very considerable danger; but I am dealing now with the war to which I have reduced myself. As I said, I am profoundly convinced that in point of numbers the British Navy at this moment is, as it was not ten years ago I think, perfectly adequate to deal with all the questions that could arise on the sea in the case of a war with Germany, which I am still holding on to. I do not think it is necessary to go into the question (as to which I have grave doubts) as to whether the new system of training officers, and the new system of keeping men in barracks is good; but as regards the numbers, assuming that they are properly handled and the vessels properly manned, I believe the numbers are perfectly adequate.

84. For the purposes of this Committee we must assume an adequate Navy, I think?—Yes, I think so; but I would venture to submit to the Committee that it might be necessary not to asume it. However, the apprehension is that, in spite of all, although we believe in our adequate Navy, British freights would rise, insurance would rise, the prices of sea-borne stuff would consequently rise, and British merchantmen would largely be driven from the sea and either laid up or transferred to countries whose rates of insurance would be lower, since their flag covers enemy cargo, which the British flag will not do. Now, the reflection occurs that some of these apprehensions are scarcely consistent with each other. If British freights rise, that, surely, would induce not fewer but more British vessels to keep the seas. On the other hand, if British insurance so rises as to drive cargoes from British to neutral ships, then British freights must probably fall. But the final, the principal danger apprehended in war, surely—the principal thing with which this Committee has to deal—is neither freight nor insurance, but prices only. Scare is insufficient. I cannot imagine a position in which we are to have all our supplies in the same quantity and at the same price, and yet be called upon to incur a tremendous additional tax, or even a small additional tax, for the satisfaction of silly people who are scared without any ground for being so. If freights alone rose, or even if both freights and insurance rose, without resulting in a rise of prices, nobody would be injured; on the contrary, shipowners and underwriters would increase in prosperity, while the consumers and the nation at large would be left unaffected. It is therefore only to the apprehended rise in the price of food and of raw material that I submit attention need be given. This apprehension of rise in price is very great, according to the evidence given before the Royal Commission. Authorities in the corn trade think that on a declaration of war prices might easily run up to 100s., or even 200s., per quarter for wheat. In any case, it is almost universally assumed that even if the rise were not so great as this, it would be great enough to cause much suffering to the poorer classes; and hence the desire to do something with "a view to keeping down prices," and of keeping them at a steady level. Here, again, I submit the whole question is narrowed to one of prices, which, I think, may be again narrowed to that of prices on articles of prime necessity—articles of food, and articles of prime necessity in the way of raw material—cotton, for instance. I do not think this Committee could entertain a proposal to tax the subject at large in order to keep up the supply of ostrich feathers or perfumery. There is no distress in the loss of those. There is a something, perhaps, to be said on the ground of the price of raw material and of food. Now, with regard to freights, as I have already said, if the freights rose, that would make it easier for the British ship to continue running. She would have an extra freight for the extra risk—the kind of thing which the British shipowner is always prepared to take. It is a fall in freights that would induce British ships to cease running or to transfer to the neutral.

85. Or may I suggest a failure of freights to rise, coupled with a rise in insurance?—Yes.

86. That is to say, a rise in cost without an equal rise in remuneration?—Quite so; I am coming to insurance. As regards freights alone, if your freights rise surely you will go on running, and as regards freights alone, if your freights fall you will stop running. Then I come to insurance. Insurance affects much more the goods than the shipowner. Suppose insurance to be doubled, trebled, or quadrupled, that, at least, comes to a question of extra price, does it not? Really, the more one thinks about it the more one sees that the question of price is the real final determining point that has to be considered. Does a rise in freights mean a rise in the price of food? Not necessarily. In the South African war freights went up all round from 50 per cent. to 100 per cent. on 85 per cent. of the vessels; but corn went down. The price of wheat went down from 27s. 4d. in October, 1899, to 26s. 11. for the whole year of 1900. The Committee will, of course, understand that I am not pressing this argument; I am only showing that it does not necessarily follow that because freights rise prices will rise. I put it no higher than that.

87. (*Sir George Murray.*) Other things being equal they will rise, will they not?—They might. But you cannot make other things equal; prices contain an infinity of circumstances.

88. You have quoted the South African War, but the explanation probably is that other things were not equal then; is not that so?—I think that is the explanation, and I may almost go so far as to say that other things never are equal. Prices depend upon an infinite variety of circumstances. Now, as to prices generally, and the effect upon them of war: With great respect to the corn trade authorities that I have quoted on this point of prices, who think that corn might go up to 100s., or even 200s., per quarter—I suppose it is about 27s. or 28s. now—with great respect to them, I venture to submit that it is by no means certain that on the outbreak of war prices would necessarily rise, or that even at the end of, say, five or six years of war, they would be any higher than they are now, or than they were at the outbreak of war. Here I am obliged to traverse a good many of the facts that were placed before the Commission. Upon the authority of the only man whose authority is of any value, Mr. Tooke, in his "History of Prices," they were led to believe, and I am sure the gentlemen who quoted Mr. Tooke themselves believed, that the effect of the great French war was to produce a very great rise in prices. Here, I think, they are mistaken. I think Mr. Tooke's statistics, which are very numerous and very complete and very authoritative, have been misunderstood, as statistics are very apt to be. They have been given without their necessary qualifications and in a form which renders them misleading. I am going to quote Mr. Tooke himself. He says, in

volume 1, page 97, "It will appear, on reference to former periods of our history, that there is no observable coincidence of a rise of prices during war and a fall during peace. On the contrary, it so happens that in the case of the agricultural produce of this country there was for upwards of 100 years previous to 1793"—which was when the French war broke out, you know—"as low a range of prices during periods of war as during the intervals of peace. This has been eminently the case with respect to wheat." Mr. Tooke only excepts from this general rule "articles subject to a tax, such as malt," to "increased charges of importation, such as colonial and foreign produce," or to "extra demand for naval or military stores." The general rule, he states, as I have quoted, and he supports it by statistics, running from the year 1688 to the year 1783. He especially insists upon it in the case of provisions in general, using these words: "The prices of meat and other provisions were as low in the periods of war as in those of peace, and in some instances lower" and he adds: "The prices of wool would offer nearly the same result. Other articles might be enumerated as affording a similar conclusion." Finally, he says this: "After six years of war (1793-8), involving a gradually-increasing expenditure, defrayed by loans, much larger towards the later than at the earlier period, we see the prices of corn, after having been elevated by scarcity, obviously rising from the seasons falling upon the return of only moderate abundance to the level whence they had risen." I have dwelt a little upon Mr. Tooke, and quoted him in order to show that, so far from supporting the contention which has been based upon his figures, that prices necessarily and always rise in war, he is of an entirely contrary opinion.

89. (*Chairman.*) I think on that point I have clearly understood you, but do you suggest that the circumstances as affecting prices would be the same to-day as they were in the period with which Mr. Tooke was dealing?—No, by no means.

90. May it not be the case that the failure of prices to rise in the Great War was due to the fact that our supplies were drawn so largely from within our own borders? I suggest that the words which you quoted from Mr. Tooke point to that, for he excepts for instance, articles of colonial and foreign produce from the rule that prices do not rise?—Even articles of colonial and foreign produce fell here stupendously on the whole war, so that at the end of the war, though the French were always predicting we should be ruined because they said, "England is full of colonial produce which she has to sell at a low rate," yet in fact such an article of colonial produce as sugar we were getting at 6d. per lb. while the French were paying 6s. With regard to food, I do not think it is the case that such supplies of food as we then got were all from within our own borders. In 1801 we already imported one-fifth of our food supply from abroad, a thing which is very often forgotten. We imported 1,500,000 quarters of wheat in 1801, and they did not come from within our own borders, they came from America.

91. But the difference between the importation of one-fifth and nine-tenths might have a very material effect on prices in the case of war?—Clearly; but I should say myself that the increase in the number of sources of supply, especially of food, would make any effect the war had upon prices rather less than greater, whatever the result of the war, adverse or favourable. The Committee will, of course, understand that I am re-establishing the reputation of Mr. Tooke. He is our only authority, and it is very necessary that he should not be misapprehended.

92. In fact you are traversing the assertion that war would necessarily raise the prices of food?—Yes. To all this may be added the further fact—and this is a very remarkable fact—that in June, 1817, two years after the battle of Waterloo, two years after the whole twenty years' war had been finally ended and done with, the price of wheat in Mark Lane was 135s. per quarter. It had been down to something like 42s., I think, during the war. I only adduce this, as I adduced the previous fact, to show that prices do not necessarily rise in war. They may rise, as in this instance, after war. This brings me to the conclusion that I should have ventured to advocate, even before I had gone through Mr. Tooke, that prices depend upon such an infinity of circumstances so complex and so various—various in various places, depending upon seasons, depending upon corners, depending upon stocks, depending upon demand, and depending upon supply partly—that the circumstances which finally govern prices are so numerous and so complex that it is a very rash thing to predict what the effects of anything in the world will be upon prices. But I think if we may come to any certainty with regard to prices, one may say as regards our food supply that the increase in the number of sources from which we draw it, and the very greatly increased facilities of shipping have greatly improved the situation. I suppose that in the last 70 years you could bring a quarter of corn across a given surface of the sea for a twentieth of what it did cost. I believe that in 1837 it cost 12s. a quarter to bring it from Amsterdam, and you can now bring that same quarter for under a shilling from New York. Therefore, I should say that if there is any one thing we may conclude with regard to prices it is that probably in future prices will not be subject to such great variations, and that they will move within much narrower limits than they did before. As I have said, it is always necessary in dealing with these matters to remember—and the assumption at the moment is a war with Germany—that every modern war will be waged under different conditions, which a little affects this question of prices. One of the things which constantly lowered prices in the French war was the advent of an enormous amount of captured corn and captured provisions from the enemy. We got a good deal of our stuff in the old French war not merely cheap, but for nothing, because we captured it. There are recorded instances of a market having been very considerably affected by the advent of a large amount of captured provisions. But that is a small thing. Before I quite leave this question of prices, I therefore submit that history has shown, and Mr. Tooke has shown, that war does not necessarily involve an increase of prices with regard to anything, but especially with regard to food. Here, perhaps, I may quote what I admit are selected figures, which show that in a very remarkable way. In September, 1792, five months before the great war with France broke out, wheat in England was 53s. 4d. per quarter, but in September, 1793, when the war had already lasted seven months, it had not risen beyond the 53s. 4d., but had fallen actually to 45s. In fact, really if I might draw my own conclusion and express my own moral, it is that it is an extremely dangerous thing to predict anything whatever about prices.

93. I gather you would almost go further, and would say that as far as you may predict, the war risk would be the least important factor in fixing prices?—Of all the factors I think so. I think you might have any war risk you like, but if, nevertheless, you happen to have a bumper harvest all the world over and new corn territory coming into bearing at that moment, no war risk that you had would prevent the prices from falling.

94. But that assumes that we should get our supplies?—Yes.

95. Now we come to the question, should we get those supplies?—Exactly. As regards physical hindrances on the part of the enemy, that we could have our supplies imported I have already endeavoured to show; and I think that it is impossible that any member of this Committee can look at a map of these islands and see how splendidly and admirably they have been placed against Europe, with all their openings so wide and so unshuttable and so incapable of being closed, without seeing that that must be so.

96. That was practically, I think, the conclusion of Lord Balfour's Commission, was it not?—It was. I am very much struck by the conclusions and the most proper conclusions, as I think, that they came to. They said this, "It does not appear to us that any effort in this direction, which it will be possible for an enemy to make, would cause any material diminution in the oversea supplies of those articles of primary consumption which are necessary for our population." Then they go on, "the effect of the naval and shipping evidence is conclusive as to the point that while there will be some interference with trade and some captures, not only is there no risk of a total cessation of our supplies, but no reasonable probability of serious interference with them, and that even during a maritime war, there will be no material diminution in their volume, unless such a disaster takes place as . . . . . a reverse that would cost us the command of the sea." I go a little further. I say if you lose the command of

Mr. T. G. Bowles.

11 Dec. 1906.

the sea, your avenues of trade will remain open, and although your supplies may be to some extent interfered with for other reasons, it still will be impossible to close the sea avenues to these islands. However, I am content for the moment to go as far as the Commission goes; I take what they say. Now, observe, this covers all supplies whatever, whether of food or raw materials; and the Commission quotes the Board of Admiralty to the effect that "our supplies of wheat and flour would arrive in practically the same volume as they come at present," and finally sums up, "With a strong fleet we find no reason to fear such an interruption of our supplies as would lead to the starvation of our people, nor do we see any evidence that there is likely to be any serious shortage." That seems to me to conclude the major part of the question. No serious diminution, no shortage, no interference. How are you going to get prices higher under those circumstances? I cannot see it. It is very hard to suppose that with the same amount of stuff coming in, your prices are to rise appreciably, if at all. Once, therefore, you have arrived at the conclusion which the Commission has arrived at, the question of price seems to me to be entirely concluded.

97. The Commission, however, in spite of that fact, comes to the conclusion that there is a real danger of a rise?—Yes, they do; and very largely, I think, on account of the mis-presentation of my friend, Mr. Tooke. They, I think, were very considerably impressed by the figures that were quoted from Mr. Tooke to show that there had been an enormous rise of price during the Napoleonic war. There was one after the war, as I have shown; but the prices, as Mr. Tooke points out, fell again.

98. The Commission also attached great importance to scare?—Yes. That, again, is a new element. I do not think anybody thought much of scare in the old Napoleonic wars. The rule then was, if you got into a fight, to send the women down below till the fight is over. They did not think much of it. But that is a new consideration, which I think is really at the bottom of the new suggestion: The Commission are of opinion that "a rise of prices under apprehension of a maritime war, and still more on the outbreak of hostilities, seems to us not only possible or probable, but, at any rate for a time, practically certain." I do not know whether this Committee have read the Report of the Commission, but it bears, to my mind, manifest traces of patchwork; and this is one of the pieces of patchwork that have been, I think, added afterwards. It is a little inconsistent, not to say very, with the previous conclusions to which the Commission have come. That is the impression it produced upon me. Of course, I have no knowledge on the point; but, being a little in the habit of writing things myself, I can sometimes see where a paragraph has been interpolated—somewhat unfortunately, perhaps. It looks to a rise of freights and of insurance as the proximate cause of what it holds to be the certain rises in prices. Now, see this: The Commission have previously declared that there will be no material diminution in our supplies, and my conclusion has been that, if that is so, there can be no material rise in prices; but that is the Commission's view too. They say the opinions given in evidence indicate that "the addition to be made to the price of wheat in time of war under this head is relatively small as compared with that which might be caused by panic." They agree with me that the undiminished supply will ensure a practical steadiness of price, at any rate will prevent a rise in price; but then they say the rise in price will be relatively small, but there might be a rise in price caused by panic. Upon this apprehension of higher prices, the Commission therefore considered proposals for the storage of grain, which it did not entertain, and for a system, which it did entertain, of national indemnity against loss from capture by the enemy. It thinks that this "would operate both as an additional security to the maintenance of our over-sea trade, and as an important steadying influence upon prices." It adds that "a guarded and well-considered scheme of national indemnity would act as a powerful addition to our resources, because it would tend to keep down the cost of transport, and therefore would go far in the direction of preventing high prices in time of war"—and hence the recommendation of this Committee. We come at last to this: That, as regards supplies, no apprehension need be felt; that they will suffer no material diminution in quantity, and can therefore hardly suffer any material appreciation of their price; that the addition to price, if there be any, will be "relatively small"; and that, finally, it is not a question of price, but only of panic—not a question of scarcity, but only of a scare. To meet this the proposal is made of a system of national indemnity. Several systems of indemnity or of guarantee have been proposed, and it is for this Committee to consider whether it will recommend any of them, and if so, which. Some would include all British or even all Colonial vessels and their cargoes; others would limit the operation of the scheme either to cargoes alone or to articles of prime necessity, excluding luxuries.

99. It is obvious, from your previous evidence, that you disapprove of any scheme. Do you care to say anything about the details of the schemes under those circumstances?—I have read, with great attention and respect, the printed schemes which the Secretary did me the honour to send me, and I might make a few remarks upon them when I come to the end of my paper. But, really and truly, I think the Committee will be of opinion that I have said as much as I could usefully say when I have come to the end of my paper. There are one or two remarks that I should like to make, but I think my general view is covered by this paper.

100. Your objections are not objections of detail, but of principle?—Yes. Sir John Glover has a very particular scheme of his own. Sir John Glover, shipowner and underwriter, would, indeed, have the Government "repay the underwriters who take the risk." As though speaking *ex cathedra*, he says: "I recommend the State to take the risk." But he prefers to give no details; and, as to its cost, he thinks no estimate is "worth the paper on which it is written." So it is a litle difficult to consider Sir John Glover's plan. Now, his is not a plan to indemnify shipowners and cargo-owners, it is a plan to guarantee underwriters in their business. The State is to pay. Coming to the real schemes, Mr. Douglas Owen's is evidently the most serious and the most important, and is very ably thought out. It seems to me that there is a general agreement that the scheme should not be one of insurance in the usual manner, since no premium would be charged. At once I say that if you are going to charge an adequate premium, it will be far better to leave it to the underwriters who do it now, than for the State to enter upon so extremely complicated a business, in which the difficulties and the calculations are very considerable, and in which the State would be very greatly exposed to fraud. The plan practically before the Commission, I think I am right in concluding, was one under which no premium should be charged, but under which, in case of capture, the owner of the British ship, as well as the owner of the British cargo, would be indemnified gratis by the State. That is really what I take to be the proposal. I will at once say that all the schemes embodying that proposal seem to me to be unnecessary, vicious, intolerably expensive, and certain to open up a series of very grave dangers and embarrassments. I have already stated to the Committee that I think the schemes very dangerous, unnecessary, and objectionable; but I will at once admit that they certainly would probably, as the Commission says, give a "stimulus to the enterprise of British shipowners." But it would be a stimulus in the wrong direction—it would be a stimulus not in the pursuit of carriage, but in the pursuit of captors for their ships. If you give a man the certainty of being compensated if his ship is captured, surely you do give him a very strong inducement to get it captured, and there an end. You would not get rid of the national burden. All you would do would be to transfer it. The ship captured has gone to the enemy, and it is lost to the country. Who is going to bear the cost? At present, it is the consumer, who is reached by the insurance. In the future it will be the tax-payer. It would give a stimulus to the enterprise of British shipowners; but they would be stimulated, not in the pursuit of carriage by their ships, but, as I say, in the pursuit of captors for the ships themselves and of the consequent indemnity.

101. That assumes, does it not, that they would make a profit out of the indemnity? If it were a mere indemnity for the loss, they would be no better off by getting their ships captured, would they?—No.

102. And indeed they would be worse off, because they would lose their future earning power?—Yes,

but generally speaking, if a shipowner wants to be sure of making a good thing, the only certainty is to get his ship totally lost. Shipowners tell me that they go on from year to year struggling and striving against bad times in the utmost confidence that sooner or later that total loss will come. So, when you pay for a total loss you always put the shipowner in a good position. Then comes the question of over-insurance. The burden would be there. Freights and prices would find their level all the same. The difference would be that the merchant and the shipowner would be subsidised by the State in certain eventualities, which the subsidy itself would tempt them to court if not to create. Now I venture to come a little closer, if the Committee will allow me, to the arguments that are used in favour of a scheme of national indemnity. I have endeavoured to summarise them fairly. First, it is alleged that it would be "more economical than private insurance, because the country will only have to pay for actual losses." That you will find on page 53 of the Commission's Report. The State has never yet conducted any business more economically than private enterprise, but always, on the contrary, far less economically. The excess of premium over actual losses now paid would go but a short way towards the expenses of a new indemnity department. The Committee will observe that it is only the margin of profit that is here in question. Whether the loss is met as now by the underwriter, or whether it is met by the State, the loss itself is the constant thing; and the difference between the State doing it for nothing and the underwriter doing it for something would be the underwriter's profit. That is not so large as is sometimes assumed; and against the profit you have to put the losses, which are considerable. There have been many underwriters who have failed, and for large sums too. Therefore, I think you have to consider the loss as well as the profit. Yet, even if it be true that the country would only have to pay for actual losses, which is altogether doubtful in my opinion, it is also true that the country would receive no premium, and that the State, therefore, instead of dividing all the losses among all the possible losers—which is what the underwriter system does—would itself bear the whole of the losses. But the State being a pauper, except for the tax-payer, this means that it is the tax-payer who would bear the losses. Now the tax-payer is not identical either with the shipowner, or with the cargo owner, or with the final consumer; he is a different and a larger person. He includes them all, but he is not identical with them. There would be, therefore, a shifting of the burden of a very serious nature. The burden itself would be no less; but it would no longer be borne as it is now by all those interested in the goods in varying proportions which, by percolation, ascertain themselves, if I may use the term. At present the loss is represented by the insurance; that insurance goes on to the price of the goods and gets down at last to the consumer of those goods, but not to the consumer of other things—for the consumer of corn does not pay for ostrich feathers, nor the consumer of ostrich feathers for corn. Each bears his own share of the insurance. In my opinion that is right; but at any rate he does bear it, and it is the consumer and nobody else that bears it. You are now going to say, or you would say, by this scheme, that everybody shall bear it; whether you consume corn or ostrich feathers, you shall all bear the same proportionate share of this loss, and it shall no longer be the loss of the consumer or of the man who is interested in the goods, but it shall be everybody's loss, and you shall all bear it equally. So that it would be a transfer of the loss from the person who now suffers it to the tax-payer at large, which I conceive would be a very great and wanton injustice.

103. By the transfer of the loss you mean rather a transfer of the burden, do you not?—Yes.

104. Or rather a redistribution of the burden than a transfer, would it not be—but perhaps that comes to the same thing?—If I transfer your watch from your pocket into mine that is a redistribution of property, undoubtedly. I think it is a complete transfer, as I think the whole loss would be transferred. The second argument is that "War premiums are an exaggerated measure of the risk incurred," for "they contain a large scare element." I do not think they are an exaggerated measure of the loss incurred. I do not know that there is anything in which there is a keener competition than in insurance. Premiums are fixed competitively, and if one man asks 1s. per cent. too much, there is another man who will take that shilling off.

Mr. T. G. Bowles.

11 Dec. 1906.

105. (*Sir George Clarke.*) Is that in war insurance?—All insurance included. Practically there are the same underwriters who insure for war as those who insure for the ordinary risks.

106. There is a keen competition for taking war risks, is there not?—At a rate. If it were found that one underwriter was charging more than another underwriter thought it could be done for, that other underwriter would come in. All I mean to assert is that premiums are settled by competition.

107. (*Chairman.*) But the market for war risks is a much narrower one than the market for ordinary maritime risks, is it not?—I think that is so.

108. Much narrower probably because it is a much more speculative business?—Yes.

109. And fewer people care to engage in it?—Yes. Of course the Committee will understand that I am not an expert in underwriting, but I think certainly the ordinary insurer who wants a steady sea risk and no more, which is fairly well ascertained now, would be very likely to keep out of the war risk—or market, as I suppose it would be called. But even among the fewer people who deal in war risks there is competition. I do not think, therefore, it can be assumed that the premiums are an exaggerated measure of the risk. As regards the scare insurance, the insurance against that risk, that may be next to nothing. There, of course, the gambling element comes in even more largely than in what I may call the legitimate war risk. That scare insurance is confined, I think, to even fewer people; but they burn their fingers about it terribly, constantly. People instead of making money out of scare risks, have lost money by it. If I remember rightly, one of the underwriters before the Commission said so. He said that those who had gone into this scare insurance had done very badly by it; at any rate, that is so I believe, from inquiries I have made.

110. (*Mr. Beauchamp.*) When you speak of a scare in this connection, do you mean a scare which has not come off or resulted in war?—I was using it in that sense then. The insurance against a war risk in case of a war that is apprehended but has not yet broken out, for instance, I should call a scare risk.

111. Under those circumstances the underwriters have always made their money, because there cannot be a loss?—That would be so when the war does not come off. But then there is the scare risk of the war that does come off, and it is there that the underwriter loses. I was perhaps using the term incorrectly.

112. (*Chairman.*) I suggest that you were using it as meaning a war policy taken out in apprehension of war?—Yes.

113. Distinguishing it from a war policy taken out *flagrante bello*?—Exactly. I think before the Commission there was evidence to show that in the Spanish war the underwriters had rather burnt their fingers in some of the scare risks, using the term in that sense, which had become total losses. Now by the third argument national indemnity is said to be the most equitable mode of meeting war losses because "ordinary war insurance will fall most heavily on the poorest class of consumer," while national indemnity "will fall upon the taxpayer." But does not insurance fall *pro rata*, if it so falls at all, equally upon the poorest and the richest class of consumer according to their consumption?—Surely it must fall, if at all, on what the consumer consumes. It cannot be suggested that the consumer of corn pays the insurance or ostrich feathers, or the consumer of cotton that on perfumery; nor is it likely (seeing that there is no probable diminution in the supply of corn) that under the premium system the corn consumer would pay any war insurance thereon at all. If there is going to be no dimunition of supply and no increase of price, at any rate the corn consumer is not going to pay anything of the war insurance, whereas you clap it on to him. The proposed system lumps necessaries and luxuries, corn and cotton, perfumery and ostrich feathers together; the 190 million pounds' worth of food together with the 146 million pounds'

Mr. T G. Bowles

11 Dec. 1906.

worth of raw material, and the 191 million pounds' worth of luxuries and other articles not of prime necessity; and then claps upon the taxpayer the cost of all that may be captured. Whether ordinary insurance in its final incidence ever gets beyond the final consumer, rich or poor, of the thing insured is not pretended, and is indeed most doubtful. That, except in the articles consumed by that class, it ever reaches the poorest class at all is most improbable; that the insurance on ostrich feathers—I take those as a typical thing—would ever reach the poorest class who do not use them I think is most doubtful, in fact I should entirely deny it as a matter of opinion myself. But that all taxation does finally percolate and permeate down to the lowest class, I think is undoubted.

114. The interests of the poor in anything which is the subject of manufacture may be very real, because it may touch their employment?—Quite so.

115. And so the scarcity of luxuries may affect the poor, not as consumers, but as earners of their daily living?—Yes, as workers on the luxury, certainly. But whether that be so or whether that be not so, undoubtedly if you clap something on to the taxes at large, that is certain to touch the poor. It touches them in a hundred ways, some of them direct, others indirect. Double the burden on the people, and the chief part of it will really be borne by the poor in spite of all your efforts to get more out of the rich.

116. Those are the problems of taxation?—Yes, and perhaps I ought not go into these economic questions. I think it will be usually admitted that the poor at any rate do feel the extra burden of taxation. If so, if the argument I have used be well-founded, then instead of it being true that the substitution of a national indemnity for ordinary premium insurance would relieve the poorest classes it is rather the contrary that we should conclude. It would put an extra burden upon them hitherto borne by the particular consumer of the particular article; that is what I should say. The fourth argument is that national indemnity "will prevent an abnormal rise in the price of imported commodities, because there will be no war insurance to be included in the price." But we have already been told that there will be no material diminution in the supply of these commodities. If that be so it is hard to see how—war insurance or none—any abnormally high price can be got from the consumer. Again, if national indemnity does save the consumer from war insurance, it is only because it puts it upon the taxpayer at large. The loss is there and it has got to be supplied. The only question is whether you are going to allow it to be supplied, as at present, by the extra charge placed through insurance upon the consumer, or whether you are going to put it upon the community at large. The fifth argument is that national indemnity would obviate the mischief of the "free ship, free goods" clause of the Declaration of Paris by compensating British shipowners for capture, and by thus inducing them to avoid transfer of their ships to the neutral flag, and to keep these ships running. But is this so? Would not the risk, such as it is, remain exactly where it was? Would not the actual mischief remain exactly where it was? Would not the only difference be that the cost of the mischief would be borne by the taxpayer instead of being borne by the consumer, who would otherwise pay the war premium? Suppose the case of the risk and the consequent premium being so high as to cause the shipowner rather than pay it to lay up his vessel or to transfer it. What would be the difference then? Would it not be this—that whereas, had the shipowner been left alone with the present system of premium he would either lay up or transfer, if he is covered by the national indemnity he will no longer lay up nor transfer but will send his ship to sea at all hazards, being certain of his indemnity. Would it not be this, that the ship instead of being laid up would be captured, that the ship and its carrying trade would still be lost to the country, but that its full value, and probably something more, would be paid by the taxpayer? The ship will be gone all the same, the trade will be stopped all the same; and supplies to that extent would fail all the same; but a vast sum would be transferred from taxpayer to shipowner. The sixth suggestion is "Captain Inglefield suggests that the Admiralty would be much freer (under a system of national indemnity) as regards naval strategy than if they were expected to provide convoys or were otherwise subject to pressure from the shipping community." If the Admiralty fails in its duty and falsifies its strategy because of panic, not only the First Lord but all the Board ought to be hanged. But the shipping community will hardly want convoy if by national indemnity they are made sure of compensation, convoy or no convoy. Under these circumstances the only pressure that can be expected from them on the Admiralty will be, "Stand out of the way and let me go and get captured. I do not want to be convoyed." The shipowner will be put into the position which every shipowner desires to be in, and which otherwise in this world he never can be in—a certainty. He would be in a heaven of voyages without risk, with a certainty indeed of the fullest and most certain compensation there where the risk would be otherwise greatest—the risk of capture. He would be, as I say, in a riskless heaven. But where would the taxpayers be? In another place.

117. (*Captain Ottley.*) One point with regard to the argument you have just developed. It appears to me that the whole question of the shipowner's desire to get his ship captured turns upon whether he is going to make a profit by that or whether he is going to get just the bare bedrock price of his ship. The price which he has got to prove is the value of his ship at the particular moment of capture, is not it?—Yes.

118. If we assume that he was going to turn a few pounds by the capture of his ship, then I admit that the inducement exists, though I cannot admit that the inducement, unless it was a very enormous one, would compensate for the very real danger that the shipowner would run of being had up upon a charge of barratry and of the fraudulent giving away of his ship. As I understand it, the bedrock principle of any scheme, either to indemnify or to insure, would be that the shipowner should only receive the bare irreducible minimum of the value of that ship, and not a farthing more. The onus of proof would lie upon him. He might endeavour to show that the ship was worth £100,000, but the experts who would be arrayed on the other side, the average adjusters and other expert persons, who would form the committee of claims, would tax his bill down to the irreducible minimum. If that is so, then, I confess, I cannot see how the argument that there is an inducement for a shipowner to get his ship captured can be admitted?—I am obliged for your remark. On the subject of value, the Committee is probably aware that that is one of the most difficult points that have to be dealt with by underwriters and shipowners. I think I may venture to say this, that whenever a total loss is incurred and the shipowner is paid for a total loss, it is always to the advantage of the shipowner. As to the question of value, as I say, I believe it to be one of the most difficult questions. I do know this, and I know it from recent information which has come to me, but which I need not cite, that it is possible that there are ways of putting your value up beyond what it really amounts to, and that these are suggested to shipowners and can easily be carried out. In case of damage, for instance, as you know, probably, the underwriter only pays when the damage reaches a certain proportion of the total; I do not exactly know what it is. I believe it is constantly the case that damage, if it does not reach the limit which makes the underwriter liable, can easily be made to approach that limit. I am using this as an argument to show that value is a very indeterminate thing—a very elastic thing. I do believe myself that when you pay for a total loss, in 9 cases out of 10 the shipowner is extremely well compensated for it. He is fully compensated and usually makes a bit of a profit. That is my belief, but, of course, the Committee will remember that I am not an expert. I do not know whether these considerations may help you. They are not presented authoritatively.

119. Frankly, we have most carefully considered that point, but I think the fundamental principle upon which the Committee is inclined to work is that we should be absolutely certain that we did not pay a brass farthing more than the actual bedrock value of the ship; and unless we can do that I am afraid any system of insurance or indemnity must fall to the ground?—I quite understand that; but may I respectfully submit to the Committee the extreme desirability of their being quite sure that they can ensure that they will not be paying more. My belief is that it will be quite impossible.

Mr. T. G. Bowles.

11 Dec. 1906.

120. (*Chairman.*) I understand your view to be that it is practically impossible?—It will be, at any rate, very difficult, I think. Some other considerations arise whereof I will present you with one illustration. In February, 1902, a United States syndicate, then known as the Morgan Combine, which afterwards developed into the International Mercantile Marine Association, bought British ships of an aggregate of over 1,000,000 tons, which they capitalised at £39,000,000. All these ships, although they then ceased to be owned by British subjects, were—improperly and unlawfully, as I have always contended—allowed to retain their British registry, and have since traded, and are still trading, under the material advantage thence arising. All of them have retained the character of British ships; their alien owners have acquired the status of British shipowners; and they would all, I conceive—I think there can be no doubt about it—be certainly capturable by an enemy at war with Great Britain. Is the British taxpayer to pay for them? Is the British taxpayer to be called upon to pay either the £39,000,000 at which they were capitalised—to the alien, mind you—or the much smaller sum at which I should value them, say £17,000,000? If so, let the Committee consider what the temptation will be on the outbreak of war. There will be a strong temptation to the wily neutral to buy another million tons under these conditions, keeping them under the British flag as in this case, and when they are captured, coming down upon us for the £17,000,000, the £20,000,000, or the £39,000,000. Nay, the very enemy subject might do it. This is not extravagant if you consider the various frauds that have been perpetrated and attempted in the old wars. It is not impossible that the very enemy subject might buy a million tons of shipping, send it out for the very purpose of getting it captured, by his own cruisers, and then come upon us for compensation. I hope the Committee will not think this out of place. I am trying to reduce the thing to the absurdity which I think it is. But, as a fraud, that is not of such a character as to take it outside of the category of some of the frauds which have been attempted and perpetrated in previous wars.

121. (*Sir George Murray.*) What inducement would the neutral have to do that?—To get his cash—to get his 39 millions. He makes a speculation as Morgan did

122. (*Chairman.*) Would it be an inducement to him to pay 39 millions in cash to-day in order to receive back 39 millions in cash a month hence, when he has lost his ships?—No, for he would lose interest on the money then, at any rate. Morgan did not pay 39 millions in cash, but he is prepared to show, and, in fact, he spread himself out to show to the public that they were worth 39,000,000, and got subscriptions on that basis. Here, you see, the difficulty of value. I do not suggest that he would pay the 39 millions. He might get those ships for 20 millions and yet be able to prove to everybody's satisfaction that they were worth 39 millions, and then I should have to pay that. I only put this as one of the extreme cases that occur to one; I could have given others, but I thought that was strong enough. Nor is this all. At present the capture does not always result in loss. The owner or underwriter fights the case, and often, because of doubt or difficulties obtains restitution from the prize court, whereof, of course, there are numberless cases. But with a system of national indemnity no owner or underwriter need, or would, fight at all. All the cases would go by default. The utmost he can get from the prize court is restitution, and he gets that from the State—I mean, if condemnation ensues. The prize court itself would have a new inducement too, and a new justification for condemnation; for, under the proposed system, there would be no question of ownership, the British State owning all. The fact of condemnation would make the State the owner if it were doubtful before, and the ship and the cargo together would, for that very reason, be condemned *sans phrase* by the court as the property, if not of a belligerent subject, at any rate of the belligerent State. It would be made such by the condemnation.

123. Wherein would the fact that the property was indemnified by the State differentiate the case in point of law, from another ship where it was insured by an individual or company in that State?—It would not be differentiated in point of law, but the Court would have it in its mind. First of all, the Court would have nobody fighting for the ship. According to my view of the case, the man who would otherwise fight says: "I am not going to fight, because I shall get my indemnity anyhow." Secondly, the Court would have in its mind that if this were not the property of the enemy subject, nevertheless if we condemn it, it becomes thereby the property of the enemy State. I am dealing with the effect upon the mind of the Prize Court, and I think that would be the effect which would be produced. You would not have a defence made so that you would have the absence of defence and the extra element of State ownership introduced after condemnation.

124. I see your point, and it is a very serious one. I only suggest that the property does not change its ownership by reason of being insured or indemnified by somebody else, whether the State or an individual?—The strict legal situation would not be touched at all, and I am not suggesting that the Court could properly, with absolute propriety, allow itself to be influenced by the consideration that this ship by condemnation would be proved to belong to the enemy State; but that it would have a material influence upon the decisions I do think.

125. A moment ago, you said that if the case were fought, the most the Court would order would be restitution; in certain cases—I admit exceptional ones—the Courts have given damages also for delay, have they not?—True. They might order damages for delay, but even that, as you will see, is only restitution. I think I may say that the Prize Court especially deals with placing the man in the same position as he would have been in had no wrong been inflicted upon him by the capture; and therefore, if he has been delayed, these damages are really a restitution of his time in the shape of money.

126. It is only important because if it were not possible for him to do that, clearly it would be less profitable for him to win his case in the Prize Court than to make a total loss and get indemnity?—Prize Courts are very chary in giving, and have always been very chary in giving, compensation for anything beyond the bare value of that which has been taken from the man unlawfully. But to resume. Indemnity after loss would, after all, not prevent loss; indeed, it would rather encourage it, because it would be a subsidy from the taxpayer to the shipowner and the merchants. That may be good for shipowners or merchants, but that is not to the interest of the State. The interest of the State is not that supplies should be lost and paid for, but that they should be preserved and come into the country—not that shipowners and merchants should get cash, but that the nation should get the stuff. National indemnity would not ensure this, but rather the contrary. What the State requires is not payment after loss, but security against loss; not national indemnity, in my opinion, but a national Navy adequate in numbers (including cruisers), efficient in men, and set free once more to exercise all its powers. There remains the last and, perhaps, most important consideration of all; and that is the cost of a national indemnity. That has been somewhat lightly dismissed. I admit that it is difficult to come at it with any exactitude, but I do think that with diffidence some approaching forecast of it may be made. The value of the goods involved would be in each year all that was landed in Great Britain during that year, and all that was exported during that year—in fact, all that is afloat during the year, and therefore, exposed to capture at sea, and entitled to be covered. Here I may refer to the Statistical Abstract. In 1905, there was imported, that is, brought into our ports and landed from the sea, merchandise, diamonds, bullion, and fish amounting to a total, roundly, of 633 million pounds. By the way, I think you must cover diamonds if you are to cover other things. I do not understand on what principle some gentlemen have proposed to exclude diamonds and bullion. Surely they are the things that are most usually and most invariably insured, and your scheme would be extremely incomplete if you did not cover them. The imported merchandise amounted to 565 millions, the imported diamonds from the Cape of Good Hope alone amounted to 6½ millions, the gold and silver bullion in specie to 51½ millions, and fish to 10½ millions. Fish again you must cover. The fishermen are not exempt from capture, and they have been captured to an enormous extent. By the comity of nations, and by the kindness and humanity of States, they are often left alone to pursue their calling. As a matter of fact, in the old French war, they were the only medium of communication between the two

Mr. T. G. Bowles.

11 Dec. 1906.

sides. They used to smuggle our goods over, and they acted as spies for both sides. You must cover those therefore. That makes the total imports 634 millions. Now the exports of merchandise and gold and silver came to a total of 438 million pounds. Therefore, the total property afloat during the year 1905 was 1,072 million pounds. Of that it is shown by the Commission and by the expert witnesses that one-third was carried in foreign ships—neutral ships. Those, under the assumption on which we are working, would not be liable to capture, because they would be covered by the neutral flag. I therefore deduct a third of the value, which would be 357 million pounds of those which are not liable to capture, and that leaves me with property afloat during the year liable to capture of the value of £714,893,000.

127. Ought you not to make some deduction for the transhipment of neutral goods?—I did not go closely into that, but, generally speaking, under the old rule, if you found goods consigned to a British merchant in Great Britain, they would be *prima facie* enemy goods. I ought to mention another thing. In addition to these values which I have given you, there is all the coastwise trade, which is immense—almost as big as this, in fact—all of which would be liable to capture. There might, of course, be in this some property which might be capable of being proved to belong to a neutral, and therefore exempt, but I do not think there would be a large amount, and, as you see, I have deducted a third as being carried by neutral ships, and excluded the coastwise trade, which is immense. I think that estimate of 715 millions as the value of the property that would be liable to be captured in the year, is a very moderate estimate. That sum represents stuff which has to be covered by indemnity once in the year and no more, for it runs the war risk once and no more, in or out. But it is different when we come to the ships. There it is not the case of one war risk in the year, but of many. Each of them makes on an average some five round voyages, or 10 single voyages, in the year. That is drawn from Appendix B in the Report. The ship must be covered, therefore, not once only in the year, but for as many voyages as she makes, at so much per voyage, if she makes ten voyages then ten times. Now the navigation returns show that there were on the Register of the United Kingdom, on December 3, 1905, 20,581 British ships of an aggregate net register tonnage of 10,735,582. I will only take those that were employed in the year which were 10,597,761 net register tons. It is manifestly proper to take only those that were employed. In addition, there were vessels belonging to British colonies and possesions of a tonnage of 1,596,000 whereof there were employed (I have had to estimate this) 1,580,000 tons. Then, besides those, there are the British fishing vessels, which the statistician has left out, that is to say, there are some which are registered under Part I of the Act, and some which are registered under Part IV, and some which are not really registered at all. The statistician will certainly be in my debt before I have done with him; but I think I have got it right now. I have to add to the total tonnage 176,000 for the British fishermen, and that gives me a total net register tonnage of 12,354,000. If I want to get at the value of that, that is extremely difficult, most especially when you are dealing, as we are here, with net register tonnage. As probably many members of this Committee know, the real way in which shipping is dealt with is on the carrying capacity, and a ship of, I suppose, 2,000 net register tons would very likely carry 6,000 or 7,000 tons weight. That is the thing, the 6,000 or 7,000 tons, in regard to which ship dealings are really carried on, whereas we in our wisdom have got an abstract conventional thing called the net register ton, which is very much smaller. However, I have had to take what I can get. In estimating the value, I first of all went to Sir Henry Hozier, who valued 7,400,000 tons of all sorts of British shipping, "from fast liners at £40 per ton down to depreciated tramps" at £96,000,000, or £12 17s. per net ton all round. Then I made inquiries, for the preparation of my paper, of other authorities, who said they thought it was far too low. They pointed out that there were many vessels like the "Oceanic" which cost £100 per net register ton to build. Then I had the instance given me of a new tramp steamboat, of the cheapest type in the market, of 2,763 net tons, sold this last month of November to an American firm for £45,500, or £16 10s. per net ton. They conclude, therefore, that £12 17s. is far too low, and that £20 per net ton all round would not be extreme. With this difficulty among the doctors, I came to a sort of compromise of £17 per net register ton, which is more than Sir Henry Hozier estimates, and less than my shipping expert friends estimate. Taking then our total net tonnage at 12,354,000 tons at £17, say, we get a total value of the tonnage of £209,920,000. That is the value of the tonnage employed during the year; but since each makes an average of five round voyages, or ten single voyages out or in, each year, each must be covered ten times in the year at a rate per voyage.

128. (*Mr. Lindley.*) Including those who were lost on the first voyage?—No. I am assuming the vessel goes through all the voyages without being lost.

129. You are assuming she is not lost in the first one?—Yes. I am assuming the vessel would have completed her ten voyages. The whole value to be covered, therefore, is 2,099 million pounds for ships. Now add the value of the goods which I have already given, 715 million pounds, and that will give you the total value of ships and goods liable to war risks in one year as 2,814 million pounds.

130. (*Chairman.*) I do not quite follow the grounds for your multiplication of the value of the ship by the number of voyages?—I want to get at the cost, and the only suggestion of war risk that I have is war risk per voyage. I have not seen anywhere any evidence as to what war risk per annum would be.

131. May I suggest to you a *reductio ad absurdum*? It would appear on this calculation that we might lose 2,099 million pounds' worth of shipping in a year, but clearly we could not do so, because that would be to lose the whole of our shipping ten times over?—I know, and I have got that in my own mind. Take the "Lively Sally," who goes out on the first of her ten voyages, and is captured. We have not got to run the risk of the other nine voyages in her case. But I am dealing with the "Lively Sally" on the assumption that she completes her ten voyages, in each one of which she will have to bear the war premium, because the risk would be there.

132. That would be conclusive if you were to consider it as a question of what the cost of insurance to the owner would be. He would in that case have to cover each voyage that she makes; but we are considering—at least I thought that was the point to which you were directing yourself at the moment—what is the possible loss to the State?—I am coming to that. I am going to try to ascertain the real war risk in each case in each war. I am getting at the value in order to value my percentages; that is the real purport of my paper. Assuming that these vessels do complete their ten voyages, in each of the ten voyages they would be subject to their war risk and would be charged upon it, and for each of the ten voyages the war indemnity, such as it is, may have to be paid. As I have said, on my figures we have a total value of goods and ships of 2,814 million pounds. What now is the true measure of the war risk for this vast property, without reckoning underwriters' profits? What is what I call the naked war risk? Captain Inglefield, of the Naval Intelligence Department, puts it at 2½ per cent.—naked, without any underwriters' profits. Mr. Douglas Owen, secretary of the Alliance Insurance Company, puts it at from 5 to 20 per cent, but I am not sure that he means the naked war risk, I am not sure that he does not mean clothed with the underwriters' profits. But he says he would call it 10 per cent., and he strikes a sort of average. Then Mr. Leverton Harris, shipowner and underwriter, says he "will assume 5 per cent. per voyage on a tramp steamer crossing the Atlantic." He, too, I think, does not mean the naked war risk; I think he means the naked war risk clothed with the underwriters' profit. So that you see it varies—Captain Inglefield 2½ per cent, Mr. Douglas Owen 10 per cent., and Mr. Leverton Harris 5 per cent. Here again from my point of view it all depends upon the particular war. I think you cannot take a war risk without coming to the particular war you mean. In some wars the naked war risk, that is to say, the actual loss for that is what it comes to, and that is what this Committee is really dealing with, will be quite inappreciable. In others it would still be inappreciable for certain voyages, while for different voyages in the same war it might rise to the 10 per cent. suggested,

or even higher. I approach this very diffidently, but I have endeavoured to take account of the different situations of the different countries involved, and particularly of the three—the United States, France, and Germany—their coast-line, their spirit, their enterprise, their ports, their naval aptitudes, and so forth. I have endeavoured to arrive at the actual naked war risk, the loss by capture in each of these three cases. I think that in the case of war with Germany, for the reasons already given, and taking the present relative naval strength, seaboard, ports, and all into consideration, the true measure of the naked war risk would be even less than the lowest estimate of 2½ per cent. which is suggested by the experts. My feeling is, that when finally ascertained, it would not exceed, even if it reached, an all-round rate of 1 per cent. per voyage. In the case of war with France, I attach so much importance to that that I think it might reach 2 per cent. per voyage; and in the case of war with the United States, I think it would reach 3 per cent. As the Committee will see, my estimate of the naked war risk is far below that of the underwriting experts. They put it at 2½ per cent., 5 per cent., and 10 per cent., but my highest is 3 per cent., and in the case of a war with Germany I put it as low as 1 per cent. Now I come to apply it, and now perhaps the Committee will see why it is that I have been obliged to make some endeavour to get at the total property that would be exposed to war risk.

133. (*Sir George Clarke.*) The estimates that you are giving us now of the rates of insurance are your estimates based on what you think would be the total loss in a particular war, are they not?—Yes.

134. Your estimates, therefore, are not estimates of what insurance rates would be likely to be charged in the open market?—No. My estimate is an estimate of the naked war risk.

135. You are not putting before us the insurance rates which, as matters now stand, would have to be paid?—No. That is not my calculation. Of course, you will understand that it is a very imperfect calculation, and one that has to be put forward with great diffidence, but it is the best that I could make, and it is some attempt. Applying this to our ascertained 2,814 millions of property, in the case of a war with Germany, taking it only at my modest 1 per cent., the cost would be 28 millions a year; in the case of a war with France, at 2 per cent. it would be 56 millions a year, and in the case of a war with the United States there would be not only the 2,814 millions, which I should put at 3 per cent., amounting to 84 million pounds, but in this case the one-third of the property carried by neutrals, which I have hitherto excluded, would also have to be taken into account, because in the case of a war with the United States that too would be liable to capture. That is, therefore, another 10 million pounds which has to be added. In the result I estimate that in the case of a war with the United States the naked war risk would amount to £94,710,000 a year. Again, I would ask the Committee to observe that my estimate of the war risk is very considerably below, and, probably, dangerously below that which is estimated either by Captain Inglefield, who puts it at an all-round 2½ per cent., or by Mr. Douglas Owen, who calls it 10 per cent., or by Mr. Leverton Harris, who calls it 5 per cent. I have thought it necessary very strongly, for reasons which I have ventured to lay before the Committee, to differentiate between the different wars. The very lowest of these sums is staggering, and it is impossible not to ask whether it would not be at once cheaper and more efficacious and in all ways better to take the sum, whether it be 280 millions or 28 millions, and spend it on the Navy; whether it is not better to have naval insurance rather than national indemnity—better security for the stuff rather than tax-raised compensation for its owners. I think it is. These are some of the considerations which seem to me completely to condemn in principle the project of national indemnity as suggested. But there is one last objection to it which is scarcely less serious. It would of necessity involve the setting up of an Indemnity Department. This—unless it differed from all other public departments—would grow gradually but certainly and very seriously in expense, and would be an extra and an abiding burden upon the taxpayer for all time, even if for all time in future we should neither have war nor rumours of war. The probability of such a Government department managing adequately the tremendous and very difficult business with which it would be charged is small indeed—of managing it, that is to say, so as to protect the State not alone from the frauds, but also from the follies and mistakes of those shipowners who claimed against it. Frauds, follies and mistakes there certainly would be. It is probable—those who have followed the dealings of Government departments with telephones, telegraphs and savings banks will probably deem it certain—that the department would prove incompetent fully to deal with them. If so, if it were consequently to authorise compensation for anything more than actually unavoidable losses by that much more the cost would be increased to the State, by that much more the cost would exceed any finally ascertained market premium now levied, even in the time of the greatest conceivable scare. The indemnity, like the rain, would fall equally upon the just and the unjust, upon the wise and the foolish, upon the cautious man who always insures and the rash man who runs his risk without insuring. The case of the special ship specially indemnified by the Spanish Government, which steamed straight into the enemy's arms at Santiago, and thus easily earned her indemnity, would not be wholly unknown. The case of a vessel worth £30,000, whose insured value for national indemnity would be raised to £50,000, would also not be unknown. Certainly, the proportion of losses by capture, when encouraged by a certainty of full compensation, would be greater than if there were no such certainty. The extent of the risk to the State would be unknown. It would certainly be very great. It might be tremendous. It would unquestionably be such as could not prudently be added either in the shape of an immediate levy of taxation or in the shape of debt, to the burdens on a country already weighted with the increased taxation and swollen debt necessitated by war. It is for these reasons that I myself think that a scheme of national indemnity could not be reasonably entertained or safely adopted by the State.

136. I think I have very few supplementary questions to put to you. I gather that you do not attach any serious importance to the Admiralty regulations as a prevention of the wilful loss of the ship, or of the shipowners taking improper risks?—The whole question of Admiralty regulations—which, by the way, is one of the points in the schemes—is really a subject in itself. Generally speaking, I think the complications and the exigencies of modern trade are such that it would be impossible for that trade to submit itself to any Admiralty regulations as to when and where they should start, what they should do, and so forth. In regard to regulations as to convoy, I think, from a military point of view, convoying might be equally efficacious as it was in the old war, and probably, if coupled with a system of patrol and fixed points or stations at the crossings of the lines, it would be more efficacious. But to make Admiralty regulations that ships should gather together and wait—ships which are costing the owners perhaps £50 a day for demurrage—I think it would be impracticable, and would be equivalent to stopping the trade.

137. To take a typical case, which, I think, has been suggested to you, suppose the Admiralty told the ships that they must go north about instead of coming up the Channel?—I do not think there would be a great difficulty in that. Of course, a ship might in certain cases go into a navigation risk, which would be thus caused by the State.

138. It might again, under certain circumstances, practically close the Suez Canal for trade, and the Admiralty might say, for a certain time that route is not safe, and indemnity can only apply to ships that go round the Cape?—That is a regulation which I think would be one of the easiest of all to be enforced. I think there would be no difficulty about that at all. Where I see a tremendous difficulty would be in ordering ships to conform to certain places and dates, rates of speed and all the things that an admiral would like to have them do if he were to have to take charge of them.

139. I was not contemplating a system of convoy. I rather assumed partly for the reasons you have mentioned and partly for other reasons that that was out of date. What I was assuming was that the Admiralty would give certain directions which would at any rate exclude the State from having to indemnify for what anyone with reasonable skill and knowledge could have said beforehand was not a fair risk to run?—I think it would be much better to let

Mr. T. G. Bowles.

11 Dec. 1906.

the shipowner take his own way of avoiding the risk. They are cleverer and dodgier than the Admiralty would be. They probably could give points in methods of escape and methods of cheating, which are after all the methods of war. The methods of war are methods of deceiving our enemy, are they not? The shipowner is very good at them, and I think he would probably take better care of himself than any regulations could take care of him.

140. My point was a little different. It was not to suggest that the Admiralty would in such matters manage better than the shipowner or the shipmaster; but could you not conceive of the Admiralty laying down certain general rules of conduct of a wide kind such as those I have suggested, which at any rate would make it very difficult for the shipowner wilfully to throw away his ship on a hopeless errand, and yet to claim the guarantee?—I would back the shipowner against the Admiralty, if the shipowner meant to get the utmost out of the compensation. With regard to regulations I think that such a large and wide regulation as you have suggested with reference to the closing of the Suez Canal there would be no difficulty at all about. But I do not think Admiralty regulations would prevent the perpetration of fraud. I think that is one of the great dangers of the scheme. Barratry has become one of the fine arts, and I should be very sorry to expose the State and the taxpayer to what I think would be a very greatly increased danger of this kind.

141. (*Sir George Murray.*) Taking the very cheerful view which you developed at the beginning of your evidence about the prospects of our trade in time of war I do not quite follow the objections which you raise in the latter part to a system of indemnity. Surely the worst you can say of an indemnity scheme would be that it would be almost nugatory and cost nothing?—I have, as I think, reduced it to the naked risk. I have taken war with Germany at 1 per cent., whereas it is sometimes estimated at 10; but even then I show that the cost would be tremendous.

142. Is that consistent with the view developed in the earlier part of your evidence, that in time of war everything would go on almost exactly as it does now, that our supplies would come in with the same regularity, that no ships would be laid up and none transferred and so forth?—I think that even the 1 per cent. is higher than it would be, but call it $\frac{1}{2}$ per cent., that is only one vessel in 200 or one sovereign's worth in 200 captured by the Germans. I think it is very likely it would not be more than that. But I am taking a very much more moderate view of what would be our losses by capture than the experts, even though on my view they would be considerable. What is at the bottom of my mind is the very great extra risk beyond the real naked war risk that would be imposed upon the taxpayer by the temptation, not to put it too finely, for fraudulent claims. I think these claims could be increased immensely.

143. If you could eliminate fraud and all other considerations of that kind, your objections to the scheme would be a good deal diminished, I take it?—If the sky fell we should catch larks. I do not think you can eliminate fraud. It is one of the dangers in these cases.

144. (*Chairman.*) You do yourself a little injustice by speaking of fraud only, do you not?—Quite so.

145. Your fear is equally of recklessness the moment the check of possible loss is withdrawn, is it not?—Yes. Fraud is too strong a word I agree. I do not mean only fraud. I think it would be recklessness like the vessel that sailed into Santiago. "If she gets in, all right, if not, we are indemnified." There is no sort of risk you cannot get a shipowner to undertake. My real fear is of the very considerable addition that would be made, as it were artificially, to the amount the State would have to find. The real risk I think does not reside merely in the state of war.

146. (*Sir George Murray.*) It is over and above what the risk would be if it was met by ordinary insurance?—Yes.

147. It is the additional risk which a State scheme of indemnity brings in?—Yes.

148. (*Sir George Clarke.*) Have you considered how far the present doctrine of extending contraband affects your objection to the "free ship, free goods" doctrine? If contraband is extended, as it has been to food, coal and raw material, even to such matters as cotton, does that not very much affect the position of the neutral?—No doubt any extension of the doctrine of contraband does affect the position of the neutral.

149. As goods of almost all kinds have lately been declared contraband, does the point in the Declaration of Paris you object to hold as much as it used to?—I do not quite agree that almost every kind of goods has been declared contraband. I should put it, if you will permit me to say so, in this way—that governments have attempted to declare goods of many kinds contraband, but their declaration has constantly remained ineffective, because unsupported by the decision of the only authority, which is a prize court. Take the case of rice in the recent French war in the Far East. The French declared rice contraband of war, but that did not make it contraband of war. No French prize court was ever appealed to, and so there was no authority for it. I do not know whether I make it clear, but there is a very great difference between the statement of the government of a state that they regard a certain thing as contraband, and the authoritative decision of a prize court which alone constitutes it so.

150. We have seen some rather curious decisions of prize courts in Russia?—Yes, we have.

151. That might repeat itself?—Certainly.

152. Then I think you said no legal difficulty exists to the transfer of ships, and you quoted the "Baltica" decision. Is it not the fact that the principal laws of a great many countries absolutely prohibit it as matters now stand, and that the "Baltica" case cannot affect that?—Yes. Take the case of the United States laws. They will not accept ordinarily for an American register any vessel not built in the United States; but see the effect and how that has been evaded! The Morgan Combine has got a million of our tonnage. The law is evaded by keeping on the British register.

153. But that is not the same thing; it is not transferred to the American flag?—No, it is not.

154. There are not many countries that ships may be transferred to in time of war, are there?—I do not know that. They could be transferred to Belgium, to Holland certainly, to Norway, to Denmark and to Sweden. Then I think they could certainly be transferred to France and to Spain; we sell any amount of our ships to Spain.

155. In peace time?—Yes.

156. Those cases you presented to us were transferred to Belgium and Denmark, but of course no belligerent would recognise transfers to such countries as those in time of war?—Why not?

157. They could not permit it. These would be obviously not *bona fide* transfers, but transfers solely made in order to evade capture, and a strong belligerent would not recognize them?—Why should they not be *bona fide?* I am not considering pretended transfers. A pretended transfer would not be acknowledged, but in the case of a *bona fide* transfer of a ship that was paid for, I cannot conceive any belligerent refusing to acknowledge it. I do not think it has ever happened before.

158. It has never happened on a large scale, has it? Indeed it has.

159. Not on a large scale, surely?—Not on an immense scale.

160. (*Chairman.*) I think you have pointed out to us that it follows from the "Baltica" case that you need not pay cash down for the whole value of the ship?—The essence of that case was that she was transferred on the seas, which is often considered to be a great difficulty. She was on the seas at the time she was transferred.

161. Do you happen to remember the case of the "Ariel"?—I have heard the name.

162. That was almost at the same time, and I think it was a ship belonging to the same owner. Part only of the purchase money was paid at the time of the purchase, and the remainder was agreed to be paid out of the earnings of the ship. The Privy Council held that the non-payment of part of the purchase money did not create a lien on the ship in favour of the seller, so as to render the ship in the possession of a neutral owner liable to seizure by a belligerent?—I remember that case. For myself I cannot conceive

any belligerent refusing to recognise what is so ordinary and so accepted a thing as the *bona fide* transfer of vessels for cash.

163. (*Sir George Clarke.*) A transfer to avoid capture, not a transfer as a matter of business is what I am considering; and the question is if that were going on on a very large scale whether the belligerent would say, "This is rather too much, I do not recognise it," especially in the case of a transfer to such small countries as are the principal people whose laws permit transfers?—I confess I can see nothing in practice or in principle or in previous history that would justify or encourage a belligerent to refuse to recognise a transfer lawfully made.

164. Then there comes the question of the crews and the officers; are they to be denationalised, or would the ships be filled up with crews from other countries?—I think they would generally have neutral officers and men.

165. Or the crew would go over to the neutral flag, thus denationalising themselves?—I think the greater part of the crews would be furnished by the neutrals. But you must remember that in modern days the facilities for abjuring your allegiance and for taking on a new allegiance are very great. Our own belligerent crews might perhaps be tempted by high wages to ship in the neutral ship.

166. I think you told us that the United States transferred a ship or two to the Belgian flag because of the fear in the United States of the Spaniards using privateers; but you have modified that now, since the Chairman has explained that both Spain and the United States adhered, for the purposes of war, to the Declaration of Paris?—Pardon me, they did not. What they did was, they said they would waive the exercise of their rights during that particular war, and Spain expressly excluded the first Article of the Declaration of Paris.

167. Therefore these ships could not have been transferred from the United States flag to the Belgian flag owing to the fear of the Spaniards using privateers?—What the reason may have been that actuated those who made the transfer, of course we do not quite know; but the fact of the transfer, you will remember, I quoted from Mr. Wilson's book called "The Downfall of Spain," that is my authority. He says all the American liners were transferred to the Belgian flag.

168. Did they hoist it?—I have not followed it further than that.

169. I think that wants investigation?—I think the scare was of short duration. They very soon saw they had not much fear of Spain whether from privateers or from cruisers, and they probably re-transferred and re-hoisted the Stars and Stripes.

170. Then you refer to the big ships which the United States commissioned as auxiliary cruisers. Take the "St. Paul" and the "St. Louis"; why do you consider them in any way less efficient for the purposes of attacking our commerce than privateers? It seems to me that they would be the most dangerous antagonists to commerce that could be conceived?—I do not think them less dangerous; I do not think I committed myself to that.

171. You gave me that impression?—What I meant to suggest is that they are exactly the same as privateers.

172. Then the declaration about privateering is of no value?—It is of no value at all. It has been entirely evaded. The "St. Louis," for instance, which you took as an example, is exactly in the same position as a privateer. She is a private ship, but she is subsidised by the Government, and a small portion of her cost or her working expenses is paid by the Government. The essential condition is that she must be commissioned. Instead of being commissioned as a privateer she is brought into the navy and commissioned as an auxiliary. She is subject to all the regulations of war. Our privateers were exactly in the same position. The difference, if I may try to crystallise it, is that in the old privateer case it was a part venture for a part prize of war by an individual, as compared with a general venture for the general prize undertaken by the usual subjects out of war expenditure, that is, the naval expenditure. There is no essential difference between the modern privateer and the ancient one.

173. Therefore, you think the modern privateering in its new form is just as dangerous to commerce as was the old privateering?—Yes, I do.

174. It follows then, does it not, that that part of the Declaration of Paris does not matter, because the privateer remains in another form?—It follows that that part of the Declaration of Paris has never been carried out. That is the way I should put it.

175. It is inoperative?—Yes.

176. Therefore, privateering, though in another form, remains to this day?—Certainly.

177. You say war with the United States would not stop our supplies?—Yes, I do.

178. We draw a great deal of supplies from the United States; would those come through Canada, or would they stop altogether?—I was not dealing with it from that point of view. I meant that such a war would not prevent access to our shores.

179. I am thinking of the supplies coming from the United States?—Clearly they might put an embargo on corn. I think even then a great deal would come through Canada. But I was dealing with the avenues to these Islands, and the impossibility of closing them.

180. You did not mean an economic stopping of supplies due to a state of war, but merely stoppage by the United States of ships at sea?—Certainly.

181. May I sum up your general contention as it appeared to me: That insurance rates would never raise prices sufficiently high to affect the nation as a whole. Is that your view?—I took the conclusions of the Commission as to prices, and I draw the inference from their conclusions that supplies would come in practically the same amount, and that therefore there would be no rise in prices.

182. That is pretty much what I said. You think that insurance rates would never raise prices enough to affect the nation as a whole—because that is the point for us to consider, and if that contention is correct, *cadit quæstio*?—Insurance rates, whether high or low, I hold, fall upon the consumer alone, and consequently not upon the nation at large. That is what I have tried to put. You, the consumer of such-and-such an article, shall pay the increased price of the insurance of that article; I, who do not consume it, should not pay it.

183. But the insurance rates, you think, could never raise prices high enough to become a serious national question?—No; I do not think they would in case of war.

184. You do not think that insurance rates will cause British shipping to be transferred to a neutral flag?—In certain cases, as I have said—for instance, in case of war with the United States or with France—I think there would be very material and considerable transfers.

185. Because of the height of the insurance rate?—Because of the doctrine that the neutral flag covers the goods.

186. Because of the fear of great insurance rates?—That would be the final cause. The final effect would be the partial exclusion of our flag, so far as it could be excluded by international law.

187. I think you wish to impress upon us that it is not necessary to make any special provisions against a panic, even though the panic need not be a silly one. That is not a thing that we need take into our consideration?—May I remind you what happened when the existence of England depended upon it, and two policies were discussed during the French war? One was whether we kept our fleet, as Lord Howe desired, on these shores to defend us against the French and their allies (at one time the whole of Europe), or whether, as Lord St. Vincent desired, we sent them out to fight on the five-fathom line of the enemy's coast. Lord St. Vincent said: "The old women of both sexes want the fleet kept at home; I am for taking it to Toulon, and all these other places, and fighting on the enemy's coast." Surely that is the answer always to people who are affected by panic?

188. I am afraid that is not so, and I am afraid we are much more liable to panic than we were in the days of St. Vincent. Anyhow, you feel that we should not be justified in proposing any special measures merely to guard against panic?—I do feel that very strongly.

189. (*Mr. Beauchamp.*) You have almost ruled out as impossible a war between this country and America and France, and you have confined your investigations in this matter chiefly to Germany?—Mainly to that.

Mr. T. G Bowles.

1 Dec. 1906.

But I have not left America and France out of possible account, of course.

190. If we were at war with either the United States or France, I think we are all agreed that our supplies would not be stopped, but that they would be hindered in coming in?—Yes; I think they would be hindered—not to a material extent, though.

191. If they were hindered, would not that cause a rise in the price?—Yes; I think it is quite possible it might. I have based myself largely upon the conclusions of the Commission which took the evidence of persons much more competent to speak on this matter than I am; and they came to the conclusion that there would be no diminution in any war.

192. If that is so, the price would rise whether we had a system of indemnity or a system of an insurance or not?—Yes; but you see the Commission say that they do not anticipate any considerable rise in price. They look for a small rise. If you will pardon me for saying so, I have not thought it my business to go beyond the conclusions of the Commission in that respect. I have adopted them and I have worked upon them.

193. On the question of the rise of freights, you seem to think there would be no transfer in consequence of the rise of freights, and that the British shipowner would still go on because he would get a higher freight?—I should say so.

194. But if the freight only rises in proportion to the cost of the war insurance, the shipowner would not make any greater profit than before?—No; in that case he would be in the same position.

195. He would be in exactly the same position, would he not?—Exactly; the one would be compensatory of the other. And then I think he would still go on.

196. But the rise in the cost of the war insurance of British shipping would place him at a disadvantage in respect of the neutral, would it not?—Yes.

197. And therefore he would not be able to compete on equal terms with the neutral, and the neutral would get the carriage of the goods instead of the British shipowner getting it?—I am not sure. I think that again depends very largely upon the war, and upon the amount of pressure that the war exercised upon British shipping. Just see how we compete with the vessels of other nations, although they have easier conditions with regard to deck cargoes, cheaper crews, and everything else. Thus we are at some disadvantage; nevertheless we go on fighting them, and, on the whole beating them.

198. If we were at war with France, the war insurance of everything coming from the Black Sea, for instance, might—or would, I think—rise?—Yes; I put it at double the risk of a war with Germany. The Mediterranean trade would be seriously impaired.

199. And that, of course, would increase the cost of the article to the consumer?—Yes, anything no doubt that interferes with trade would. But as I have told you I have put it at 2 per cent. I look upon it as so much more serious than a war with Germany, partly in consequence of the Mediterranean.

200. Do you think that during a war with France the rate of war insurance in the Black Sea would be as low as 2 per cent?—No; I do not say that. Mine is a view of the naked war risk realised over several years of war. If I may use the illustration, it is what I think would correspond to the 2½ per cent. realised war risk during the 20 years of the Revolutionary and Napoleonic wars. On the whole, we lost 2½ per cent. of our trade then. I do not think we should lose as much now. I think it would be 2 per cent.

201. Two per cent over the whole?—Yes; but it might be 20 per cent. for a month or a year.

202. And in certain localities it might be much greater?—Yes, certainly.

203. Everything coming through the Mediterranean would have a greater risk of being captured than on any other route?—Certainly.

204. Assuming that on a vessel from the Black Sea the rate of insurance would be 5 per cent., which I think is not over the mark?—I think it might be that.

205. Assuming that the ship is of the same value as the cargo, then the owner of the ship would seek to recover the cost of the insurance of the ship by charging an extra rate of freight on the owner of the cargo, and assuming that to be equal, the cargo owner would have to pay 5 per cent. on the value of the ship and 5 per cent. on the value of the cargo, which would raise the cost of the cargo by 10 per cent?—Yes.

206. Do you quite agree with that?—I follow it. On those assumptions those consequences would ensue.

207. Do you not think that a rise in the cost of the article by 10 per cent. would be or might be a serious burden on manufacturers and on the consumers generally of that particular article?—Yes. But while I agree in that particular case that the assumption you make would be followed by the consequences you suggest, I still say that on the whole no such consequences would ensue, because there would not be on the whole any diminution of our raw material or of our food. Your ship that comes from the Black Sea with the extra 10 per cent. on her has to compete with another ship that brings the corn, if it be corn, as I suppose it would be, from the Argentine, which has no such 10 per cent. put on her. Then either the grower of the Black Sea corn has to put his prices down somehow in order to equalise it, or the ship stops running, and you get your supplies from the Argentine alone. That is the way in which the one thing compensates for the other. I do not think there would be any 10 per cent. generally all round.

208. It would only be with regard to those particular voyages which were subject to the greater danger?—With regard to the particular voyage there might perfectly conceivably be the 10 per cent., and yet there might be no general 10 per cent., because the bulk of the stuff might come from elsewhere. Then comes a battle and you smash the French fleet, if it is to be the French fleet, and then away goes your 10 per cent. and everything, and your insurance falls to the normal, and the trade is resumed.

209. You said shipowners always made a profit on a total loss?—That is a presumptuous thing to say, but that is my idea.

210. I do not myself quite agree with that statement. You say that in the case of a national indemnity, neither the shipowner nor the underwriter would go against the captor, and seek to get back either in specie or in bullion his loss. Could it not be made a condition of any indemnity that he should subrogate all his rights, and that then the State would be able to sue in the name of the owner of the cargo and get it back?—Yes, that could be done. I think if you had any system of indemnity it would be absolutely necessary to have that as a condition; but even then it would leave the State at a great disadvantage as before the Prize Court, would it not? Because the Prize Court would feel that it only had to condemn to make it the property of the enemy State.

211. But the action would be brought in the name of the original owner?—No doubt, only the Prize Court would know very well that condemnation meant a fine on the enemy Government.

212. The rights would still remain, however?—Yes, they would.

213. And that might have an influence on the Prize Court?—On the mind of the Court? I think it would.

214. I did not quite follow you in what you said with regard to the cost to the State under this scheme. Assuming that the loss is only 3 per cent. per annum, then clearly you have only got to reckon out the 3 per cent. on the 714 millions?—It is not per annum. It is per voyage.

215. But the loss is calculated during the year, is it not?—In calculating the loss of shipping some take 2½ per cent. and some 5 per cent. and some 10 per cent. per voyage.

216. The general assumption on the part of the Admiralty, I think, is that the loss is 2½ per cent. per annum. Some witnesses say it is 5 per cent., and some say it is 2½ per cent., but that is per annum and not per voyage, I think?—Mr. Leverton Harris, a shipowner and underwriter, whose words I have quoted, says, "Assume 5 per cent. per voyage on a tramp steamer crossing the Atlantic."

217. That is the premium he would charge?—Yes.

218. But Captain Mahan and all the authorities have said that the loss during the old Napoleonic wars amounted to 2½ per cent.; that is, 2½ per cent. per

annum?—It is 2½ per cent. on the whole war—that is 2½ ships out of every 100.

219. That is even better, because if it lasted five years and was only 2½ per cent. over five years, it would only be a ½ per cent. per annum?—On that assumption, yes.

220. (*Chairman.*) This is the point that I tried to put to you earlier. Is not that 2½ per cent. of the number of ships afloat, not 2½ per cent. of the number of ships multiplied by the number of voyages they make?—I was very careful on that point, and I think I could show the Committee that the contemplation of Mr. Douglas Owen and Mr. Leverton Harris, both, remark, underwriters, was a war risk per voyage.

221. (*Mr. Beauchamp.*) I am differentiating between the conjecture of any underwriter that the premium would be 5 per cent. and what actually happened in the old wars. In the old wars the loss was only 2½ per cent., or as some say 5 per cent. on the whole?—That is so. Do you suggest that when an underwriter takes all the risk for 5 per cent. per voyage, he means that the true naked war risk, as I venture to call it, would be 2½ per cent., and his profit the other 2½ per cent.?

222. No, I do not quite say that. I say that no man can estimate beforehand what the cost of insurance would be in any future war. Mr. Leverton Harris and Mr. Douglas Owen think that it might be 5 per cent. per voyage, which would naturally depend upon what the voyage was. I have taken what Captain Mahan lays down, that the actual loss to the British during those years was 2½ per cent. of their shipping; therefore, clearly the calculation ought to be based on the probable loss of our mercantile marine, whatever it might be, and, assuming that the loss of the mercantile marine was only 3 per cent., then I make out that the total cost to the State would be 27 million pounds?—May I say, first of all, that in the old French war we lost about a ship a day throughout the war? With regard to the figures I got from Lloyds, I was extremely anxious to get at some approximate estimate of the cost. I felt that it was not for me to invent the naked war risk for myself. I therefore took Mr. Leverton Harris's conditions and Mr. Douglas Owen's conditions as to the rate, and I came to the conclusion that the rates were much too high. I therefore put my rate lower, but I kept it on the same platform, if I may so speak, and I took it per voyage. It is manifest, as I have said, that the "Lively Sally," if she is captured on her first voyage, does not run the risk of the nine other voyages in the year; but if she completes the whole of her ten voyages she has still a 1 per cent. risk always hanging over her. Of course, you will understand that this is only an attempt to estimate.

223. I want to get at what the probable cost would be to the nation, supposing they adopted indemnity. Therefore, we have not to take into consideration what anybody thinks the premium might be, but we have to estimate the number of losses which would accrue, and by the evidence which was given before the Royal Commission on the Supply of Food and Raw Material in Time of War, it was variously estimated at from 2½ per cent. up to as much as 4 per cent., but I do not think it went over 4 per cent?—I am glad you have raised this point, because to me the only way of getting at the value of a risk is to take the premium that is usually competitively charged for it, and if you deduct from that the underwriter's profit, such as it is, that, to my mind, really does represent the value of the risk.

224. We have never had this war, and therefore no underwriter—and I am an underwriter myself—to my mind, can estimate what the premium would be for any particular voyage?—Then I put it to you, as an underwriter, here is 5 per cent. per voyage across the Atlantic; do you suggest that 2½ per cent. of that is underwriter's profit?

225. No, and I do not suggest that we should charge 5 per cent?—Then you do not agree with your brother underwriter.

226. It would depend entirely on whom we were at war with, would it not?—Entirely.

227. I can conceive that on a particular voyage you would charge 5 per cent., but that is not the same thing as charging 5 per cent. over the whole of your risks, because it would only be on that particular voyage. For instance, for the Black Sea it might be 5 per cent., but you would not pay 5 per cent. from Denmark to the East Coast, and the rate there might be very small?—Yes, and that is the difficulty.

228-9. I think the only basis upon which we can act is the probable percentage of loss in our mercantile marine?—No doubt. But if you send your mercantile marine on 10 voyages in the year it is ten times subject to the loss or to the risk of capture, whereas the merchandise only coming once, or going once, is only subject to risk once. That is the basis upon which I, very imperfectly no doubt, have endeavoured to work it out. My idea, as you see, is that the real risk is much smaller than Mr. Leverton Harris or Mr. Douglas Owen has estimated. I think they exaggerate the risk.

230. I do not know whether they went into all voyages or only into that one across the Atlantic?—We should not allow 2½ per cent. in a war with Greece, nor ½ per cent. I have done my best, that is all I can say, and I submit my work to the Committee.

231. (*Mr. Gladstone.*) You consider there will probably be a rise in freights in the case of a war with America or France, and that would probably prevent owners from transferring to neutrals; and I suppose you also think it would induce them to keep their vessels at sea?—If there were a rise in freights it would. But in a time of scare there would be a fall in freights, because people would say, I am not going to give you the same freight that I give a neutral. But, I think, if there were a rise in freights we should keep on.

232. (*Mr. Jackson.*) I think it is quite agreed, is it not, that the two points which are of importance are: (1) that there will be a fear of the transfer of vessels to a neutral, and (2) also a fear of a rise in the price of food and raw material?—Yes, those are the points.

233. With regard to the fear of a transfer to neutrals I take it that you differentiate very strongly between the fear of such transfer in the case of war with Germany and in the case of a war with France or the United States?—Yes, I do.

234. Surely the whole thing would be governed, would it not, by the freight-earning possibilities of British ships during the war? Is it not conceivable that even when we are at war with Germany, British ships would only get cargo by accepting lower freights, while at the same time the rate of premium on the risk would be such that they would demand higher freights? Is that not conceivable, and is not that a governing factor in all the considerations of the shipowner? Is it possible to differentiate between the one more than the other in such a way as you laid it down?—I should think so, clearly, because to me, whether the risk would be transferred or whether there would be lower freights, with all the sequence of consequences you have put, depends upon the real amount of risk that the shipping runs. If you have a war with Venezuela, for instance, there is no risk, and it can have no effect on trade.

235. I am only talking about Germany. You differentiate strongly, do you not, between Germany and the United States and France?—Yes.

236. Is it not conceivable that even in the case of war with France, the risk of shipping in a British steamer might be much greater than in that of a neutral steamer?—If it were conceivable that the German cruisers kept the sea and made captures, and, generally, that they would be able to terrorise all our ships, I think it would be so.

237. In that case the inducement to transfer to neutrals would be there if we were at war with Germany?—Yes. In that case Germany would be almost in the same position as France or the United States.

238. You recognise that the inducement is the difficulty of a shipowner under the British flag to obtain a cargo for his ship?—That is where it would come in, if at all.

239. With regard to the fear of a rise in the prices of food and raw material, I understand you to say that you did not consider that there would be any diminution in the quantity of food supplies or raw materials in consequence of any war?—That is what the Commission said; I quoted them.

240. And you endorse that view?—I do.

241. In consequence of that you draw the conclusion that there will be no rise in prices?—Certainly. If you have the same amount of stuff, I do not see how you are to have a rise in price.

Mr. T. G. Bowles.

11 Dec. 1906.

242. Is not the general price of an article governed to a great extent by the cost of the material?—The price is the cost.

243. Even if you had the same quantity of stuff, but it cost you 30 per cent. more to get it here, surely the price would go up by that 30 per cent.?—Not if you only have the same demand.

244. Would there be anybody who would be so philanthropic as to sell the stuff at below the price which it cost him?—I think they would be driven to do so, if they brought the same amount of stuff year by year that the people want. I think they would be incapable, *quoad* the war and *quoad* anything that runs from the war, of getting an extra price for it.

245. Then you do not admit that the cost of transport would have any influence on the prices of materials providing that the same quantity got here—that is what you are contending, is it?—I do not think I should like to commit myself quite to that; but I do commit myself generally to this, that if on the whole series of years of war you have undiminished supplies, I cannot understand how there can be any great increase in price.

246. Not although the cost of getting the stuff here was materially increased?—No, because then I think if it had any effect it would have the effect of stopping the supplies.

247. (*Chairman.*) I gather that in the main what you have said has been directed to a consideration of the general results of war spread over a considerable period, as our great naval wars were?—Yes.

248. But you do not exclude the possibility of considerable and even violent fluctuations of price within a limited period?—No; I think that is very possible.

249. I think you told us that you thought the fluctuations would be between narrower limits than was the case in the old time?—Yes, because of the increased sources of supply. When you only had the Black Sea to get supplies from, your Black Sea case was a very strong one, but when you are able to supplement the Black Sea supplies by supplies from Canada and the Argentine, it becomes less strong.

THIRD DAY.

Wednesday, 12th December 1906.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, Bart, M.P.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Mr. H. LLEWELLYN SMITH, C.B.
Captain C. L. OTTLEY, R.N., M.V.O.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. FREDERICK HUTH JACKSON.
Mr. ARTHUR LINDLEY.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Captain HARRY JONES, R.N., called and examined.

Captain H. Jones.

12 Dec. 1906

Captain Jones, in a preliminary memorandum,* had submitted:—

(1) That a national guarantee is desirable in order to give effect to the principle that in time of war private property at sea should be in the same position as private property on land.

(2) That it would give an additional inducement to the country to maintain an efficient Navy, and would leave the Admiralty unhampered by private interests in time of war.

(3) That without a guarantee transfers to a neutral flag are to be expected, and would be effective if our enemy and a strong neutral were acting in collusion.

(4) That the heaviest losses to the Mercantile Marine in war time are to be anticipated whenever the enemy takes up a policy of a *guerre de course*.

(5) That the experience of the Naval Manœuvres of 1906 is pertinent, as showing the difficulties to be expected under a scheme of State insurance.

(6) That a gratuitous indemnity is preferable to insurance.

(7) That a scheme (Scheme C), under which the State should indemnify in case of loss only when minor risks had already been insured by the underwriters, would be practicable.

(8) That Pitt's Convoy Act of 1798 forms a precedent for the lines on which the funds for payment should be obtained.

(9) That strict conditions as to inspection previous to sailing and to obedience to Admiralty orders would be necessary, and that neutrals should be treated in the same way as British shipowners for the purposes of an indemnity.

250. (*Chairman.*) You are Assistant-Director of Naval Intelligence, I think?—Yes.

251. And you were the head of the trade division of the Naval Intelligence Department, were you not?—Yes. I held that position for six months, from June to December of last year, and then my duties were changed.

252. In that position did you succeed Captain Inglefield?—Yes.

253. Captain Inglefield gave his views on the subject referred to us before the Royal Commission on the supply of food and raw material in time of war, I believe?—Yes, he did.

254. I understand that you have examined his views?—I have read his papers and his evidence very carefully. He also discussed the matter with me, and explained a great many of the difficulties with regard to insurance laws and customs, which he had been studying for between the three and four years that he had been at the Trade Division.

255. Are you generally in agreement with his views?—Generally, yes.

* *Vide* note, p. iii.

256. What are the exceptions that you would make?—I think that the weak point of his scheme was that he provided no fund from which the indemnity should be paid. He also made no distinction between luxuries and necessities, that is to say, between goods which in war we could get on without and food stuffs and raw materials. They were all on a dead level, in fact. Then apparently the money had to be raised by loan, but he did not go into that matter.

257. On general grounds of policy, do you think that a scheme ought to provide for some contribution from the shipowner?—On general grounds of policy, yes; but I think that Captain Inglefield's argument that the consumer eventually paid was perfectly sound, though perhaps you may not get everybody to believe in it.

258. Do you believe that that would be the case whether you made the charge on the shipowner or not?—Yes.

259. If the charge were made on the shipowner he would recover it ultimately from the consumer?—Yes.

260. I think the view that the shipowner should contribute is one which received the support of the late Sir George Tyron, did it not?—I cannot say so without qualification. Sir George Tyron did not go very deeply into the method of collecting the funds, but there is one paragraph in his article which I might read. He states that "it would not be unreasonable to collect a due on arrivals and departures, based on the value of the ships and their cargoes, and to enforce it against neutrals as well as against our own vessels. The sums so collected to go towards defraying the cost of the protection of trade and of the facilities afforded to commerce." You will see that Sir George Tyron's article is very general, but it pointed to the best method of collecting the funds.

261. Can you state any precedent for a contribution of the kind you contemplate?—Yes. Pitt's Convoy Act of 1798, to my mind, forms an admirable precedent for the lines on which the fund should be obtained.

262. Can you tell me very briefly what its leading provisions were?—The Convoy Act firstly laid down regulations for the merchant ships under convoy, and provided fines for disobedience, so that Admiralty Orders could be enforced. Secondly, it provided a fund by taxation ostensibly for the purpose of defraying the expenses of the convoy, but as for this there would only have been a few frigates, the expenses of which would have been small, it is probable that the fund raised by this taxation must have been very much in excess of the actual requirements for the direct protection of commerce. There was a tonnage due which was levied on British and neutral shipping either clearing or entering British ports, and there was a schedule of taxation, of import duties, on different articles which were imported at that time. This scale is apparently drawn with the view of favouring the necessities and penalising the luxuries, and I maintain we can do the same now.

263. Of course, as you know, Mr. Pitt at that time had a general schedule of customs duties already in force?—Yes.

264. And on that he imposed a higher scale?—Yes.

265. That we have not at present?—We have not so general a one, I admit, but we have the machinery.

266. I just wanted to get your ideas on that point, but I need not pursue it. Will you state to the Committee generally the reasons for which you think a scheme desirable?—I do not think I can do better than refer to Sir George Tyron's views expressed in 1890.

267. Do they represent your own views to-day?—They do.

268. Then perhaps you will summarise them?—If nothing is done, the cost of food to the consumers will be greatly increased in this country and to an avoidable extent. By nothing being done, I mean if we leave things to be settled commercially by insurance.

269. The cost of food will be raised by what?—By the war premiums.

270. Not, you think, by scarcity, but by the war premiums?—Yes. Undoubtedly they must be added to the cost. The next point is that the industries of the people will be greatly checked, and their purchasing power reduced.

271. For the same reason, I imagine?—For the same reason. Then shipowners would be under strong inducement to part with their vessels, and those most marketable would be the fastest and best ships. Then as the people pay for the Navy, the people would pay twice over for protection, as they would have to bear the cost of the excessive war premiums also. But, on the other hand, if the State agrees to bear the loss due directly to the action of the enemy, the preservation of private property at sea will be approximately assimilated to the preservation of private property on land, and effect given to a principle more important to our nation than to any other. It would aid in the maintenance of the industries of the people during a period of war, enabling them to earn wages and the means to purchase the necessaries of life. The public policy of keeping the consequences of a state of war within the narrowest limits will be maintained. It will support the important national interest of keeping and maintaining the lion's share of the carrying trade of the world, and check the undue development of neutral tonnage at our cost. It would have a good international effect, for it would be recognised as a national step taken to preserve our trade and commerce, while it gives no special advantage to those who might look to large profits at our expense as the consequence of our being involved in war. It would act largely in the interest of the maintenance of peace, as it would discourage the idea that we can be attacked through the direct and indirect effect of war on trade and commerce under our flag——

Captain H. Jones.

12 Dec. 1906.

272. Let me interrupt you there to ask you a question: Are you sure that that would be so? I put it to you that the result would be to transfer the loss incurred by mercantile shipping from individuals in its first incidence to the State as a whole. Would that not be an encouragement to the enemy to strike as much as possible at our commerce?—No, I think not; if I may explain. I think the only way in which a *guerre de course* can be really effective is by bringing pressure to bear upon the Government. If the losses are spread over the whole community, that is the best and most economical way of bearing them, because then nobody will feel the pinch to an alarming extent, and the loss will be moderate on everyone. On the other hand, if things are left in their present condition, the losses temporarily—I do not anticipate for a long period—will be very severe; temporarily they may be very high, for perhaps a week or so. To my mind, that might possibly be more than the underwriters can stand. It may ruin some of the underwriting companies or individual underwriters, and so cause such unrest in the shipping world that immense pressure will be brought to bear on the Government either to modify their naval strategy and to assume a passive defence instead of an active attack upon the enemy; or it may even, in the extreme case, produce an agitation for concluding a premature peace, whereas if the loss is borne by all equally there should be no such inducement. That is my line of argument on this point.

273. (*Sir George Murray.*) It does not reduce the loss, it merely spreads it?—That is it, it spreads it. Then the last of the points which I am summarising from Sir George Tyron is that the more perfect the Navy as to sufficiency and as to organisation, the less the cost of the liability on account of a system of rational insurance or guarantee.

274. (*Chairman.*) I think what you imply by that is, that it would be an additional inducement to the country to maintain an efficient Navy?—Yes, it would. I regard rather, as a parallel, the Navy as a fire brigade, and this insurance as the fire premium. It has been argued that it is a waste of money to devote anything to this scheme, because it would be better devoted to the active Navy. It seems to me that you might just as well knock off paying fire insurance, and devote the money to more apparatus for extinguishing fires.

275. Some of the considerations you have put to us are general, but of course you come here specially to represent the naval view?—Yes.

276. What is the special advantage, from the point of view of the naval administrator, that you see in this scheme?—I think the greatest advantage of all is that it will leave the Admiralty unhampered by private interests. If the loss is national, no shipowner will

Captain H. Jones.

12 Dec. 1906.

have the right to say, "I have a valuable ship expected at such-and-such a time, and she must be protected." He would be sent about his business at once; and therefore there would be no fear of prejudice to a strategic plan.

277. You would regard it as a safeguard against the influence of popular clamour, would you not?—Yes.

278. Of course, if the Admiralty is influenced by popular clamour its strategy might be injuriously affected in many ways?—Yes.

279. Even though such a scheme as this were in force; is that not so?—Yes.

280. If they were subject to popular clamour and guided by it, they might keep the fleet watching our own ports instead of watching the enemy's ports?—That might be so, if they are.

281. No scheme of indemnity would give us an assurance for the proper conduct of a war if we cannot find that assurance in the strength and knowledge of the Board of Admiralty?—Certainly not by itself. But I think it is due to the men who have to carry on the war that they should be as free from outside pressure as possible.—I do not say that they would yield, and I do not admit that they would yield, but I think in justice to them they should be relieved of interference. The second naval reason I would place before the Committee is that you would insure that the Admiralty shall have adequate powers for a certain limited control over the movements of mercantile shipping in war, which control it is considered would be an advantage to naval operations, and would also reduce the number of captures of merchant vessels. I may say that I do not anticipate that without this national indemnity we shall have no control at all, because I believe we shall be able to do what is required with the help of Lloyd's. I do not anticipate that we shall have great difficulties in that matter. I only say that this national guarantee assists and strengthens our great object of co-operating with the mercantile marine instead of each of us going our own way.

282. Can you tell us in general terms, or illustrate to us in any way, the nature and extent of the control which you think the Admiralty might usefully exercise over the mercantile marine in war?—I think we can send our daily advices to Lloyd's and to other societies that such-and-such a route is unsafe for the present. We shall not tell them when it will be safe, because that may give away a secret. We shall say, You are not to go at present, but if you go you will not be indemnified. We have a division of the Naval Intelligence Department which is constantly examining these questions of the protection of commerce, and different methods are always being thought out. The matter will not be lost sight of, and we shall use the channel of Lloyd's Corporation for conveying what we wish the merchant vessels to do and what we wish them not to do.

283. If any scheme of national indemnity of the kind we are discussing were adopted, I take it that obedience to your wishes would be a condition of the fulfilment of the guarantee?—Yes, non-compliance would mean that nothing was to be paid, in other words, that the Government would be liable for nothing if orders were disregarded.

284. I gather that you think you could convey the news sufficiently rapidly not merely to Lloyd's, but to the ships themselves, to be of real value as a security against their running unnecessary risks?—I think while ships are in port we can get at them through Lloyd's; but we cannot get at them at sea so efficiently as we could wish under present conditions. We hope to improve that. We are always hoping to improve signalling, and wireless telegraphy will help us. For any directions that may be given in port I think the machinery of Lloyd's is most ample.

285. Now, will you please give us your third reason?—The third reason from the naval point of view is, that if the risk is on the ship-owners and the underwriters, they will naturally try to find out all they can about the movements of our own ships and of the enemy. It will be their business in assessing the premium to find out all they possibly can. But the more people who know the movements the more chance there is of the information getting out. We do not want these secrets to get out; and the fewer people who know them the better. I think if this system of State guarantee were adopted, we should be in a stronger position to send people about their business who came asking for news which had better be kept secret.

286. Would not the conditions which you lay down sometimes themselves betray what your movements were, or what action you were contemplating?—We must think about those in giving them. I think you may trust us not to betray anything that we can avoid.

287. So far you have dealt with this subject from the point of view of Admiralty policy, and from the point of view of preserving the supply of food stuffs and raw material to this country at a reasonable price; but I do not think you have said anything about another question which is before us, namely, the danger of the transfer of British ships to foreign powers?—No, I have not.

288. What is your view about that? Do you consider that in a great naval war there would be much inducement to a British shipowner to transfer his ship?—I think there is a great inducement. There are many difficulties, but I think the difficulties could be got over by collusion between the neutral and our enemy.

289. What are the difficulties which you have in mind?—The municipal laws of the different states about the right of bearing their flag. Their regulations provide for the nationality of officers and crew, time of notice, and so on. There are many very great difficulties. But all those can be got over, of course, because they can change their municipal law as quickly as they like if they see any advantage in doing so.

290. Those conditions do not apply equally to all countries, do they?—No. I can let you have particulars of the regulations of the different countries. We have them all in the Admiralty.

291. Perhaps you would supply us with a copy, because we should be glad to have it?—Yes, we could supply you with that.

292. It has been suggested that if such transfers were made the other belligerent would not respect them?—I believe that the belligerent will do what it is his interest to do. If he sees a chance of bringing us to our knees by transferring our mercantile traffic to neutrals, he will do it; and then he will not attack the neutrals, and he will not interfere with the transfer.

293-4. Now, may I ask you as between the two extremes of the different proposals that have been put to us—that for a complete indemnity, and the system by which the shipowner pays some premium to the State—which would you prefer?—I prefer the indemnity pure and simply—not the premium. I think the Government is not competent to take on that business.

295. At the same time, as you have already told us, you think the State ought to levy a contribution from the shipping?—Yes.

296. But in the form of a tax and not in the form of a premium for insurance?—That is so.

297. Will you give me your reasons for objecting to taking that contribution in the form of premia?—I have examined the evidence before the Royal Commission and the various schemes that have been put forward. They all appear to me to be impracticable for different reasons, principally the amount of business that is necessary. If the scheme was to be workable at all, we have no time to practice it, and we have no time to find out our mistakes. I am afraid there will be mistakes. The Government has no knowledge of insurance business, and there are very many difficulties in it; and if every ship has to take out a Government policy, or even if it *is* done through the underwriters, the business will still have to be done between the Government and its agents, and we cannot expect that a new Government department or a new Government business will go on quite smoothly all at once. In this case it will be tried at the very worst possible time, when all the Government offices will be at high pressure with other work, and nobody will have time to attend to it.

298. I understand that you would prefer an indemnity scheme, because, in your opinion, it would lessen the amount of work to be done?—It would immensely lessen it. I say that guarantee only necessitates investigations for the settlement of claims for actual loss. Nothing need be done except levying the necessary taxation until the enemy capture a ship, although, of course, you can appoint your board to deal with the claims when they come in.

299. Are there any other reasons in favour of an indemnity which you would like to give?—I think for the Government to collect premia is not Government business. We have no machinery for it; but we have machinery for collecting taxation. If export taxes or import taxes are impracticable in all cases, you can make it a tonnage due. Taxes are practicable. We have the Custom House and we have the machinery. If import dues are pronounced not to be feasible, the money can all be levied in the shape of tonnage dues, with favourable terms for vessels carrying corn and raw material. You can say, for instance, that the tonnage due will be reduced on ships carrying corn and raw materials. On the other hand, if you want to check the export of steam coal, you may put up the tonnage dues on a ship which is carrying Welsh coal. It appears to me that the machinery exists. For the man who can make the calculation of the sum it is necessary to raise, and how it can be raised with least inconvenience to the country, the machinery is there which will deal with it. Then, again, there is another reason. If you levy insurance premia, it does not matter how low the premia are, but it means a subsidy to neutrals which will be eventually paid by the inhabitants of this country.

300. A subsidy to the neutrals, you mean, in the sense that they are better off by the amount of the premium which they do not have to pay?—Yes. Assuming that the freights are equal to the neutral and the Briton, the British shipowner has to pay for the war insurance not only on his ship, but on the cargo as well; but these insurances the neutral will be free of, so that it means the neutral gets that much more profit. Supposing the British shipowner is just making both ends meet, there will be a direct profit to the neutral, represented by the amount of the Government war premium on ship and cargo, and that will go abroad from this country.

301. Have you considered the war insurance which the neutral will have to make?—Yes, I have.

302. That is sometimes pretty heavy, is it not?—It was pretty heavy in the late war, because there was no agreement about contraband, and the law of contraband was very much extended by the Russians. In the late war both belligerents were dependent on neutral shipping for the supply of coal and munitions of war, and for the insurance of such undoubted contraband traffic considerable premia had to be paid. That can go out of consideration for the moment, because we are not on contraband traffic here. The other interests, those of the owners of steamers and cargoes, who were not intentionally engaged in contraband traffic, were also insured at low percentages varying from about 2s. 6d. to 40s. per cent., I believe. But the necessity for such insurance arose entirely from the wide interpretation that Russian officers were permitted to attach to the term "contraband," and to the fact that in certain cases, under the cloak of their very ineffectual attempts to prevent contraband traffic, they engaged in what was in effect an attack upon British commerce. The necessity for the insurance of non-contraband neutral trade would disappear where neutrals are prepared to defend their rights, and also if one belligerent elects not to interfere with neutral trade in order to facilitate the transfer of the shipping trade of its enemy to other powers. By that, I mean this: Suppose we were at war with France, and France and Germany agree, by a secret understanding, that they are going to ruin our shipping trade and bring us to our knees in that way. Then the belligerent, France, will not interfere with the neutral trade in order that the transfer may be facilitated and our ruin brought about.

303. If you have any other reason, will you please lay it before the Committee?—Every proposal that I have seen for a national insurance involves a fixed rate of insurance. A fixed rate is proposed by some articles in "The Times" of 2 per cent. annually on the ship, and 2 per cent. *per voyage* on the cargo. That is very inequitable, because it means that the insurance rate on cargo would be equivalent to about six times the rate on shipping for the same risk. To fix in this way the rate of insurance is contrary to all the principles of insurance work and underwriting, where the premia are adjusted to the risk. The risks of the different voyages also will be very different. It is patent that a vessel in the Atlantic is not running the same risk as a vessel in the Mediterranean, and the risks will vary from day to day and from week to week. Therefore a fixed insurance is contrary to first principles, to my mind. Again, there is one more objection to insurance. There is a large amount of money expended in war scares and panics which do not result in war. I cannot see how that will be avoided by any system of insurance; whether the insurance is national or whether it is carried out by underwriters, I cannot see how that loss to the community is to be avoided. But by a national guarantee it goes out at once, and on every scare we save that amount of war premia.

304. Suppose the insurance was with the State, and the premia were all paid to the State; then, in the case of a scare which did not result in war, no doubt a certain amount of money would be transferred from the pockets of particular merchants or shipowners to the State, but it would not be lost. I put it to you that it would be a nucleus which would provide against actual loss at a time when perhaps the country was less able to bear it—I mean, at a time of war?—Then you would institute it before war begins. But when are you to institute it, and when can you claim, as a State, that this is open?

305. I suggest that it is not necessary to proclaim. Suppose the Government adopted a scheme of this kind, no subsequent proclamation would be necessary. You would legislate once for all to provide for the guarantee, and it would then be open to a shipowner to take it at any moment?—But then you must have your machinery in operation, and you must have your office always open, peace or war alike, and the staff sitting down doing nothing for 20 years, perhaps.

306. Do you suggest that that would absorb the premia that would be received?—I think it would be very wasteful.

307. Now, I want to put to you one or two objections. It is suggested that to single out these losses at sea for a guarantee by the State is to favour particular interests at the expense of the whole community in a way which other interests on land are not favoured. For instance, it has been suggested at different times that a town might be bombarded, and that we do not guarantee the citizens on land against loss?—I beg to differ. You have already done it on land—in South Africa. You paid up the losses by war on property on land. Men's farms have been burnt, and you have compensated. But you have done it afterwards, and you have not had the machinery prepared; and, probably by reason of not having it prepared, you have paid more than was necessary.

308. I think you must take it that the circumstances are different. In the first place it was, as you say, *ex post facto* payment, for the State had recognised beforehand no claim on the part of the person whose property was destroyed?—I think we should be in a stronger position if we extended it to all loss caused by the enemy. I am quite willing to see that, and I think it would be right. I think if we got a raid and a farmer's horses and cattle were seized by the enemy, so long as he had obeyed the orders of the military in endeavouring to drive them off, or whatever orders they may have given, he should be compensated. The State, and not the individual, makes the war, and I think the State should bear the loss. Besides, I think it is the most economical method.

309. That rather takes me to another point. When the State bears the loss, do you think the losses will have a tendency to get preternaturally large?—I think they will if you do not guard yourself against that, but I think you can guard yourself against it, as scheme C shows, by confining the losses to purely material things. But I think if you enter into contingent losses the State will inevitably be cheated.

310. Scheme C was a scheme that was prepared in the Intelligence Branch of the Admiralty for our consideration, I think?—Yes.

311. By material losses, you mean the direct loss of ship or cargo, I take it?—The direct loss at the hands of the enemy. I should not include deviation; but I should include capture, destruction, and seizure, and also stranding to avoid capture, because it should be the duty of a merchant vessel if he cannot get away, to run ashore to avoid capture, if he can.

312. It is suggested to us that if you give this indemnity you will, in fact, make the loss of the ship often a profitable operation to the owner, and that instead of seeking, as you would desire that he should, to avoid capture, he might almost deliberately run into

Captain H. Jones.
12 Dec. 1906.

the enemy's hands in order to be captured and to secure his indemnity at once?—I think you can avoid that by arrangement in the settlement of claims. I should not allow the shipowner to make a claim for a definite sum. He says he has lost a particular ship; you have all the particulars of the ship in Lloyd's Register, and he can show his accounts as to when she was repaired last, and how much it cost him, and it should not be impossible then for a Board to value it. So he will not know what he will get, and it will be very difficult for him to say what profit he can make. Of course, there is the possibility of ships being sent out to sea which are worn out and worth nothing. But I think you can guard against that. You must guarantee everything that is working at the time of war—you must accept that risk; but I think you can rightly not allow other vessels to depart from the United Kingdom unless passed by the Board of Trade, say. Perhaps there are several old steamers lying up that are of very small value indeed, and are never going to be used again, and I should prevent those coming in; but you can easily do that by inspection.

313. In your opinion it would be easy to ascertain after the loss had been incurred what was the value of the ship itself, and what was the value of the cargo on it, would it not?—There I speak with no authority of course. But I cannot conceive that there should be any difficulty. You have all the particulars of every ship on the Register, and I think that business people should be able to assess the fair value.

314. Did the scheme which the Admiralty elaborated for the late naval manœuvres give you any experience in this subject?—It gave us a great deal of experience.

315. To what effect?—Firstly, the difficulties of arranging the details beforehand were very great, and also the difficulties of settling the premiums and the risks which the premiums covered.

316. In that case I take it you are speaking of the premiums which the Admiralty had to pay, because, I think, the Admiralty was the insurer?—Perhaps it would be as well if I explained what we had to do?

317. I think it would, if you would please do so?—We wished to test the measures for protecting the trade and to get some idea of what dangers there might be. It was suggested in order to enable the mercantile marine to take part that we should ask the shipping that was passing across the Bay of Biscay from England to Gibraltar, and back again, to play the game with us, we paying any of their expenses for demurrage for lengthening the voyage, because they would be told to deviate to a certain extent. Apparently that was very simple, and if the underwriters had not come into the question, it would have been merely a matter of bargain between the Admiralty and each individual owner. But as soon as we began to elaborate the scheme we found there were immense difficulties. Immediately a ship deviates from her direct course between two ports, the insurance policy is vitiated at once, so that if a shipowner took part in the manœuvres and then had a collision, the underwriter would not pay under the ordinary policy, though it had nothing to do with the manœuvres at all. Also there was the danger of claims by the owners of cargoes, and other matters of difficulty. We found that the difficulties were far greater where the ships had general cargoes than where they had complete consignments. The ships going from Cardiff with coal only were comparatively simple to deal with; but with the Liverpool ships particularly, which do a more general trade and have numerous owners of their cargoes, the difficulties were very much greater, and it was proposed that we should get over them by taking out an insurance policy to cover them, the Admiralty assuming these risks due to deviation and claims on cargo and so on. There were a great many interests to insure, and we were to be covered by a policy taken out at Lloyd's for 10 millions to cover the total value of the trade. The arrangements were started just about this time last year, and the manœuvres were in June. It took very frequent meetings and a great deal of discussion and negotiation before the method of collecting the premia and getting the people in was settled; and even then it was such a new thing that a comparatively small proportion of the shipping came in—practically none from Liverpool.

318. Of course, the shipping had no inducement to come in, except a patriotic desire to assist the Admiralty in an interesting experiment?—They were paid reasonable expenses for demurrage, which had been assessed at so much per ton, so that they should not be out of pocket.

319. Your object was that they should not be out of pocket?—Yes, but they were not to make a profit out of it. The difficulties were very great in arranging the premia and in doing the preliminary work of the insurance. On the other hand, the work on the settlement of claims, so far as the material losses were concerned, was very small, and they were settled with very little difficulty indeed. Admiralty officers met some experts from Lloyd's, average adjusters and so on, and they were settled with very little difficulty, except in one case. That was a case which, to my mind, if you enter into insurance work again, shows how difficult it may be to distinguish if you go on the principle of having policies of insurance, whether it is the State's risk or the owner's risk.

320. Could you tell the Committee what the case was?—I speak rather from hearsay, but I think I can give you the facts. It was the case of the "Torrington." The policy only covered a certain time when ships entered the manœuvre area on a certain date. We did not ask ships to delay to come in. We only wished to take the ones that were on their ordinary voyages. The owner of the "Torrington" wished to come in, and he telegraphed to the Admiralty to say that he was detaining his ship in Cardiff for a day or two so that she could come into the manœuvres. No notice, apparently, was taken of this telegram, so, perhaps by silence giving consent the Admiralty consented to this delay. Before the ship got into the manœuvre area at all, and before she took part in the manœuvres, indeed in leaving Cardiff docks, there was a collision, and damage was done and the claim arose. Then came the question, Whose policy? She was not taking part in the manœuvres, but the owner of the cargo says, You did not go straight on your voyage, but you deviated. The claim is still being discussed, but I believe it would not be difficult to settle it, except that the Government must protect itself legally, and it cannot settle matters in the way that underwriters do, but must refer them to the Crown lawyers and so on, and then when once it has to go to the law, of course there is delay which is detrimental to the business interest.

321. Is that not perhaps a great objection to the State working in this field at all?—It is. But if we do not enter into insurance I still think that if we carefully define what we are responsible for, we can be all right, and then we can leave the insurance difficulties to be settled between shipowner and underwriter, as they are now. I cannot see why we need enter into the insurance question at all. If we say, We will pay up if you are captured by the enemy, or if you are detained by the enemy, or if you are run ashore to avoid the enemy, and then we pay up for any of those, but for nothing else; if we say, We do not pay you for demurrage, and if we say, We do not pay you for loss of market or for having to go round the North of Scotland instead of coming up the Channel, and so on—that is the fortune of war, and you must abide by it—then I believe the shipowner and the underwriter will find a way out of the difficulty.

322. So that your proposal, to summarise what you have been saying to us, is that, in the first place, there should be a guarantee rather than a system of insurance?—Yes.

323. And, in the second place, the funds for that guarantee should be met in part by a tonnage tax?—Yes.

324. Or by dues levied on shipping, British and neutral?—Yes.

325. And, in the third place, that the losses for which you pay should only be the direct losses of war?—Yes.

326. And all indirect loss should be excluded?—Yes.

327. (*Sir George Murray.*) Does your scheme contemplate indemnity as regards cargoes carried between neutral ports?—No. If you will turn to scheme C you will see under I, "Persons entitled to claim indemnity" "(b) The owner of any cargo liable to capture carried in such ship." I should prefer to amend that so that it shall read, "The owner of any British cargo," because by the Declaration of Paris neutral cargo in a British ship is immune. I think it would be right to assume

that our enemy will abide by that Declaration; if he does not, it will tend to embroil the neutral with him, which we should like. Cargo between neutral ports is obviously neutral cargo.

328. Not necessarily, I should think?—No, perhaps not necessarily; the Declaration of Paris says "neutral cargo," but omits to define what neutral cargo is, and I should think there would be endless arguments about that.

329. Would you cover a British ship between neutral ports?—I would cover the British ship and British property.

330. I was thinking of the bearing of that on your scheme of tonnage dues; those ships would pay no tonnage dues at all, would they?—No. Do you think there would be many constantly trading between neutral ports and not returning to England?

331. I imagine there would be a large trade of that kind. Have you thought at all what amount your tonnage duties ought to raise?—No, I have left that to the experts. I cannot pretend to be able to say.

332. It might, of course, be a great deal more than you wanted?—It might; but then money will be wanted at the time, and in large amount, for the prosecution of the war.

333. Then the scheme would not earmark the tonnage dues to this particular indemnity, but you would take them in as part of the ordinary revenue of the country?—I should.

334. So that they could be applied to any purpose?—Yes.

335. (*Sir George Clarke.*) You alluded to Pitt's Convoy Act; is it clear that it only applied to paying the cost of convoying, and that it was not applied towards giving compensation; or did it provide compensation?—It did not provide compensation. That was left to underwriters in those days.

336. Was it only paid to the Admiralty for doing what was really part of its duty?—Ostensibly.

337. Is it the fact that the Admiralty has given up all idea of convoying in these days?—Generally speaking, yes, I should think so; but in particular instances it may be necessary to convoy.

338. You have not come to the conclusion, then, that convoying is now impracticable as a means of protecting commerce?—As a general means of protecting commerce, I should agree with you that it is impracticable.

339. The Customs tariff of that time, of course, was an elaborately differentiated tariff?—Yes.

340. And, therefore, this might have been imposed for other than the particular purpose of providing for convoying; there might have been other motives?—Yes; but ostensibly by the Act that was the purpose of raising this money, though it must have been very much more than was necessary.

341. Therefore, probably, other motives were at work?—Probably.

342. (*Chairman.*) I understood you to speak not of a general customs tariff, but of a special tax or percentage superimposed upon it?

(*Sir George Clarke.*) That is not the case in the Act, is it?—There was a tax of so much on every article which is specified.

343. It is not a surcharge at all, it is a specially imposed tax, is it not?—Yes.

344. One notices that under the tariff wheat came in free, and there was a heavy tax on French wines, for instance?—Yes, that is so.

345. So there were other motives involved than the motive to provide money for convoying?—Yes.

346. Do you think the imposition of a tariff of that kind at the present day would be a practical measure?—In peace, no, but in war, yes; because you must raise the money. The cost of war will be very great, and you will have to get the money somewhere.

347. Do you think that in time of war we should be able to impose an elaborately differentiated general tariff, suddenly?—There I will not answer, because I do not know anything of the subject. I can speak with no authority as regards taxation. But still the tonnage due is certainly practicable.

348. It was imposed on outgoing and incoming ships?—Yes.

349. It was a capricious tax, and varied from 3s. to 6d. per ton?—I have not the amounts before me, so I cannot speak to that, but I take the figures from you.

350. It was not a general tonnage tax?—I thought you said it was capricious.

351. I will not call it capricious; I will call it a variable tax?—Mr. Lindley has handed me a copy of the schedule. It was probably well thought out at the time. The taxes on the short voyages are apparently small, and on the long voyages large.

352. It has been hinted that increased tonnage dues might be imposed on neutral shipping: would that not be likely to tend to keep foreign ships away from our ports?—Not if both are treated equally.

353. It has been hinted that there should be a special rate and a higher rate imposed upon neutral shipping?—I do not see any reason for doing that.

354. Would you be against it?—I should be against that. I should treat them both alike.

355. Anyhow, do you think that the double interference with trade in the form of a new tariff, and of a sudden large tariff on the outset of a war, would be a desirable thing?—Yes, because it would supplant the very much heavier impost of the war premiums.

356. Do you think that on the whole it would cause less disturbance than a war premium?—Far less.

357. If the tonnage tax depends upon the tonnage and not upon value, take diamonds, for instance, that would mean, might it not, that foodstuffs and raw materials would be penalised?—Yes.

358. Do you think that is desirable?—If you combine the two then, by means of the import dues, you could get over that difficulty at once, because you could put a high tax on the import of diamonds and nothing on the import of corn. If you can show that the objections to the import dues are too great I would get over that by laying down tonnage dues at so much, and letting the necessaries, corn and raw materials, off easier. I should say, for instance, that there should be no tonnage dues at all on a ship carrying such, or only half the usual dues—as may be thought most desirable.

359. Then you would propose to vary tonnage tax in accordance with the commodity carried in the ship?—Yes, I should do so, if you cannot go the whole way with Pitt.

360. The high-speed vessels, of course, could not escape those tonnage dues, although their war insurance rate might be very moderate by reason of their speed, would not the effect of it therefore be rather in favour of the slow ships?—It might be so; but if it is desirable—I am not clear that it is—to give an advantage to the high speed ships you can do so by variation; you can give a rebate for speed if that is the objection.

361. I think you said that the Admiralty would be unfettered by popular clamour if there were any system of indemnity; I suppose that would not have the tendency to make the Admiralty cease to pay attention to the question of the protection of commerce, and you do not mean that?—No, I do not mean that.

362. But it would leave its hands free?—I mean that the Admiralty are of opinion that the true interests of commerce are best served by the destruction of the enemy. If they are persuaded to act on the principle of the passive-defensive instead of the active-offensive in response to what are apparent immediate necessities, commerce will suffer in the end, and the warlike operations will suffer at the same time.

363. You told us, I think, that the Admiralty was prepared to give advice to shipping on the outbreak of war through Lloyds; do you propose to send everything through Lloyds, or do you propose to distribute advice to naval stations throughout the world?—The two can go on concurrently. We shall use our Naval Intelligence Officers abroad as well as Lloyds, but Lloyds is the main channel in the British Isles.

364. Among the objections to any form of insurance is the immense amount of business it would throw on the Government, by which I presume you mean the Admiralty?—Not only the Admiralty, but the Treasury and the Board of Trade.

365. If the Admiralty had nothing whatever to do with it, except to lay down routes and to issue warnings about particular routes, would your objection be miti-

Captain H. Jones.

2 Dec. 1906.

gated?—Somebody has got to do it, and I do not think it is well to overload any Government Department in such a time with an absolutely untried scheme.

366. From the Admiralty point of view, if that were the case, the objection would be mitigated, would it not? You are the custodian of the Admiralty, and not of the general public?—I imagine the Admiralty would not have anything to do with the machinery of either scheme beyond issuing their orders to Lloyds.

367. Therefore the Admiralty objection would be mitigated if the Admiralty had no additional work thrown on it at all, in fact?—The additional work is not an Admiralty objection; it is a general objection.

368. Then, you say the lowest premium of any kind would be a subsidy to neutrals. What we have to think of here is a comparison between the present state of things and the proposed state of things, and clearly the lowest premium that would be proposed would be very much less than the premium that would, under the present state of things, be asked if war broke out. Therefore, from the point of view of the subsidy given to the neutral, the lower the premium here the less that objection of yours would hold?—Yes. It is a matter of degree. A guarantee gets rid of the whole objection of neutral advantage, while the insurance gets rid of only a part of it.

369. The neutral would be benefited so much the less as the premium paid here was decreased?—If you leave it to the underwriters, I agree.

370. You said, I think, that any form of fixed premium would be contrary to first principles, but you propose instead to have fixed duties?—Yes.

371. Is there any principle more in the one than in the other? Does it not come very much to the same thing?—No.

372. Would you say they are quite different?—Insurance is not the business of the Government, but taxation is.

373. The point being, of course, that the Government should obtain in a certain way a certain sum?—Yes.

374. Is it not very much the same thing?—No. The Government has the machinery for collecting taxation, but it has not the machinery for collecting insurance premia.

375. You say also, which is quite true, that you cannot fix premia to fit the actual requirement; would you admit that it is equally difficult to fix the proposed tonnage dues to meet those requirements?—Not if you recognise the larger issue that unless you are to provide the expenses of a war by loan entirely you must tax. You may as well let it be taxes on shipping as on anything else, to my mind.

376. In any case, you cannot hope exactly to meet the actual requirements?—No, and I should not attempt it.

377. Most systems in that respect are exactly the same?—No; I do not admit that.

378. You have laid stress upon the difficulties the Admiralty found in dealing with insurance; when you were making these plans did you consult insurance experts?—Yes.

379. Did you take legal advice on all these points beforehand?—Yes.

380. Do you see that there is an organic difference between the cases you have brought before our notice and the cases we have got to deal with? In your case you, the Admiralty, were suppliants asking something more or less considerable from the shipowners, and in the other case the country, or the Admiralty, is going to offer a very great boon to the shipowner and the shipowning classes. Is there not a very great difference between the two positions?—I do not think I admit the appellation of "suppliants." We made an offer of so much to the shipowner to come in if he wished to do so; we offered to pay him his out-of-pocket expenses. I do not think we could properly be described as "suppliants."

381. I do not care about the term "suppliants"; but you admit, do you not, that there is an organic difference between the two positions, because in the one case you are asking for something which may be inconvenient, and in the other you are giving them a very great boon?—Yes.

382. So there is an organic difference between the two?—There is a difference.

383. (*Mr. Beauchamp.*) You said that in the event of war there would be a tendency, you thought, to transfer vessels to the neutral flag, and that the faster ships would probably be the more marketable and therefore the more likely to be transferred than the slower ones. Would it not be the fact that the faster ships would probably be required by our own Government, and therefore would get higher freights than the slower ships, and would not be so liable to be transferred?—I do not anticipate that very many of the fast ships will be taken up by the Government. There will be a demand for slow ships as well. The demand will be more for the supply of men-of-war than for auxiliaries to be fitted out as armed cruisers. The demand will be greater for vessels carrying stores, coal, etc, than for the fast ship, I think.

384. Your scheme, indeed every scheme when it deals with destruction, only provides for destruction by the King's enemies?—Yes, that is so.

385. But it has been suggested that there might be great danger to our shipping from our own mines and stray torpedoes?—I think I should like to include that in the scheme, and I should be quite ready to modify the scheme accordingly. I apprehend they would probably get it even without a scheme. If they were destroyed by a British torpedo I think they would claim against the Government at once. I am quite willing to take out "by the King's enemies," if necessary.

386. Then you say that if the orders are disregarded there would be no payment?—Yes.

387. Would that include also that there should be no payment on the cargo?—I think it would be better so. I think the Government should disclaim all responsibility if orders are disobeyed. Presumably the owner of the cargo would have grounds for action against the shipowner if his cargo was cast away in defiance of an Admiralty order.

388. I think there is a little mistake in the minds of the Admiralty with regard to what is proposed to be insured against under any scheme. I think under any scheme only material, and not contingent, losses are intended to be included?—Scheme A under "Losses to be covered by indemnity" reads: "Capture, seizure, and detention by the King's enemies, and the consequences thereof or of any attempt thereat, and all consequences of hostilities or warlike operations by or on the part of the King's enemies, whether before or after the declaration of war, as ordinarily covered by an English policy." I should like to rule those consequences out entirely.

389. That is only because it is proposed to cover anything which is included in a policy of marine insurance?—Yes, I understand that.

390. Under a policy of marine insurance only those material losses are recoverable?—Yes, I understand.

391. I think, as a matter of fact, Scheme C merely proposes the same as Schemes A and B?—Looking at Scheme A, I see further down, "It is not intended that losses through delay or diversion of route in consequence of Admiralty instructions issued under Clause III. should be covered by this clause. But it would be necessary to use words which would cover any loss sustained in the improbable contingency of the ship or cargo being prevented by such instructions from reaching the country of destination." I do not see why we should go into that at all, or why we should cover that. That is the fortune of war. Take the words at the end of the note to Clause II., "but it would be necessary to use words which would cover any loss sustained in the improbable contingency of the ship or cargo being prevented by such instructions from reaching the country of destination." I should rule those words out. I do not think the State ought to pay because the man cannot take his goods to market.

392. I think those words were inserted to provide for the ship and her cargo not reaching their destination because the Admiralty said she must not move?—I should let him take it somewhere else; but I should say, you must not move there, because you would be captured. The State is making an offer, and the State has a right to say what it will pay for.

393. I think that is the only way in which anything more than is included in the ordinary policy of insurance would be covered. You said you would not extend this indemnity to what I suppose may be called old tubs, that is, old vessels that have been laid up, for instance?—I should not allow a vessel which had

been laid up to be put to sea under the guarantee. Of course, he could always put to sea on his own risk, but I should never guarantee him if he went to sea previous to inspection.

394. Provided that he had a class, and had fulfilled all the conditions necessary to maintain that class under Lloyd's Register, I suppose you would include such a vessel?—For instance, very often a vessel becomes old, and she is laid up for the time, and does not go through her ordinary survey, but the class is not struck out because it is contemplated that she will at some future time undergo the survey; supposing that she underwent that survey, and maintained her class, then I take it that she would be included?—Then I would allow her to come in.

395. Irrespective of speed or anything?—I have been thinking over the speed. I think it is better to leave it alone. I think it is impracticable to attach conditions as to speed. There are many pros and cons, but I think, on the whole, it is better for the Government not to go into the question of speed. You can do so, of course; it is not absolutely impracticable, but there are so many pros and cons that I think I should not touch it.

396. The owner of any ship registered in the United Kingdom would be covered under any of these schemes; but supposing we were at war, for instance, with the United States of America, there is the fact that we have a large number of vessels on the Pacific coast, both on the west coast of North America and on the west coast of South America, and under the present distribution of the fleets you have nothing to protect the vessels out in those districts?—True, but the fleet is not distributed with a view to war with the United States, as in the opinion of the Admiralty such a war is in the last degree unlikely, and would be the supreme limit of human folly. In the almost unthinkable event of such a war becoming imminent at any time the distribution would be altered.

397. Would you propose to cover those vessels, or to say, "You must not leave," and therefore if they left they would not comply with the Admiralty conditions?—The conditions would have to be subject to the actual state of affairs.

398. I am looking rather to the vessels chiefly engaged in the nitrate trade on the west coast of South America. Do you think, under the circumstances of war with the United States of America, you would be able to protect those vessels, or would they be obliged to remain in port?—We should have intelligence where the enemy's vessels were, and we would, through you at Lloyd's, tell you when they might sail, and give general directions for the course they were to take. The case would be judged on its merits at the time, and it would depend on the situation of the enemy's forces.

399. (*Mr. Lindley.*) Referring to your answer to one of the questions that were put to you with regard to the notice to be given, I want to understand quite what you mean. Is the notice to be given by the Admiralty to come through Lloyd's to the shipowner, or is the shipowner to give the Admiralty notice of intention to sail so as to come within the guarantee?—I do not wish the shipowner to give any notice at all. I wish him to pursue his ordinary trade, and to obey any orders he receives through Lloyd's.

400. So that there is to be no machinery except the orders given by Lloyd's?—I wish there to be no machinery between the individual and the State at all, until the individual chooses to make a claim. When the enemy has interfered with him he makes a claim, and that is the first business between the individual and the State that takes place.

401. There is a complete difference between Scheme C and Scheme A?—Absolute.

402. Under Scheme A notice is suggested?—Yes.

403. With regard to the question of what you call the minor losses to be covered by the policies, I think that what you had in your mind was the question of demurrage and loss of market?—Yes.

404. As a matter of fact those are not covered by ordinary marine policies of insurance unless there is a special policy taken out, and that is quite unusual?—"The consequence thereof" might be held to cover that against the State. I do not propose that there should be any policies of insurance issued by Government, and it is possible that the Courts would rule that insurance laws did not apply to the scheme, therefore I think the losses to be made good should be limited as stated in scheme C.

405. With regard to the question of this tax, are you aware that during the Americo-Spanish war there was a war tax put on by the Americans?—No, I was not.

406. I believe that to have been the case?—I was not aware of it.

407. I was wondering whether you had any information at the Admiralty about that?—I can make inquiries about it.

408. (*Sir Thomas Glen-Coats.*) In regard to the tonnage dues—I am not quite sure whether you have answered this question or not—do you propose to impose tonnage dues on cargo coming into this country, and also on cargoes of manufactured goods, or even raw materials, going out from the country?—Yes, on the ships entering and clearing, in conjunction preferably with import duties on separate articles, as was done by Pitt. If that is found impracticable, I propose to put tonnage dues on outgoing and incoming ships, and to differentiate in favour of those carrying necessaries—that is to say, corn and raw material.

409. Did I understand you to say that you did not propose to put these tonnage duties on until there is a prospect of war—until, in fact, war commences?—I propose to put them on when war commences.

410. That would necessarily make them very high, would it not, because you would not have any time to accumulate a fund beforehand?—I cannot say anything as to the amount. I do not wish to accumulate a fund.

411. Arising out of that if you had high tonnage duties on manufactured goods going out of this country, would it not be almost impossible for the British manufacturer to compete in foreign countries with the foreign manufacturer, and in that case would it not throw a great many people out of employment in this country?—I maintain less so than the war premiums will do. The war premiums will have that effect.

412. In what way?—Somebody has got to pay the war premium eventually, either the man who consumes the goods or the man who sells the goods. Taxation is purely a substitute for the premia, and therefore it is a mere adjustment of the burden, as it were.

413. Would it not have this effect, that if you could not sell your goods abroad you would not have the money with which to pay for your imports?—Is that not an absolute necessity of war itself, however you pay it? You cannot go to war without paying the cost, and this is one of the ways in which the cost will be paid. The manufacturer will find that he has not got to pay more to send his goods abroad, and if the amount is the same it does not very much matter, at any rate, it does not appear to me that it matters whether it is in the form of taxation or insurance.

414. Would it not make it impossible for the manufacturer to send his goods abroad, especially if the war continued for any time?—I say not more so, and I believe less so, than by war premia.

415. That would mean general taxation?—But not less than the war premia paid by underwriters.

416. I do not quite understand what you mean by war premia?—The premia for war insurance.

417. The other idea is that you should give an indemnity without insurance?—But who is to pay for it?

418. It is to be met through the general taxation of the country?—Do you mean through the income tax?

419. Something of that kind?—That is a matter for experts in finance to say. I am afraid I cannot speak as to that. All I see clearly is that the money has to be raised from somewhere, and to meet the objection that a State guarantee would unduly favour the shipping interests. I propose that the fund should be raised directly from the shipping interest. The money has to be raised from the country somehow or else borrowed, and if you borrow you may destroy your credit, I suppose.

420. (*Mr. Jackson.*) I take it that you do not intend that these tonnage dues should be specially allocated to the payment of any particular claim?—I think there is no necessity for that.

421. Under those circumstances, therefore, your tonnage dues are only a suggestion on the part of the

Captain H. Jones.

12 Dec. 1906.

Admiralty as a fresh sort of taxation in view of war for the purpose of raising more revenue?—Yes, and also to meet the objection that the shipping trade is receiving advantage at the expense of others.

422. Is that covered by your proposal? Would the tonnage dues not be paid by the goods which are imported in the ships just in the same way as the premium is?—Certainly, but I understand that the difficulty is in persuading the general public that that would be so.

423. But it would in fact be so, would it not?—In effect, I do not think it matters whether you do it by income-tax or in any other way. I believe the principle is sound, however you raise it.

424. You suggest in the case of tonnage dues, as well as in the case of import duties, that food and raw material should be exempted from such taxation?—I say that they should be either exempted or favoured.

425. That is, the vessels bringing them?—That the vessels bringing food and raw material should be favoured.

426. That would impose considerable difficulty in regard to a number of ships, would it not, which, for instance, bring a part cargo of cotton or a part cargo of wool to this country?—Yes.

427. There would be a good deal of difficulty in differentiating them, and I suppose you see the difficulty?—I see that there would be a difficulty, but I cannot see that it should be insurmountable to the Customs officials to produce a workable scheme.

428. You say that non-compliance with the Admiralty orders would mean that nothing would be paid?—Yes.

429. You also said, in reply to Mr. Beauchamp, that you would suggest that the cargo should suffer in that case just as much as the ship?—That is my personal opinion.

430. Of course, you realise that in that event the cargo might, in certain circumstances, have to bear a very considerable premium for insurance to cover those risks which the Admiralty are not prepared to undertake?—Would not the owner of the cargo have a claim against the shipowner?

431. I do not think that would be satisfactory to the owners of the cargo, would it? because the owners might possibly be very many, might they not?—Yes. I do not make a point of that; it is not essential, I think.

432. You say that contingent and consequential losses, including sea risks during deviations, would not be covered by the Government. The words in your note to scheme C are, "contingent and consequential losses (including sea risks during deviations and demurrage which are not covered by the ordinary policies)" should not be paid by the Government?—Yes; that is my view.

433. I do not wish to suppose that the Admiralty would do such a thing, but it is conceivable, is it not, that there being a certain danger in the Channel, the Admiralty might order all ships to go round the North of Scotland in order to get to London?—Yes.

434. Thereby the Admiralty would escape all claims under your scheme, and, of course, they would all be thrown on the marine underwriters, would they not?—Yes.

435. It would be obviously to the advantage of the Admiralty to do that under certain circumstances?—Yes.

436. Now, if there were only a slight risk it might be to the advantage of the Admiralty to divert the route of the ships?—It might.

437. That, of course, is a point to consider?—That is a matter for the underwriter and the shipowner too.

438. (*Captain Ottley.*) I understand that scheme C, as we have worked it out, proposes that the money for this payment of the claims put forward should be raised by taxes rather on the lines of Pitt's taxes?—Yes.

439. Do you suggest that it would be impossible for those taxes to be altered during the course of the war? If, for instance, at the beginning of the war certain taxes upon coal were imposed, during the course of the war would it not be possible to move those taxes or, indeed, to alter them in almost any way?—I see no objection to any alteration that may be found necessary.

440. As regards the alternative proposal for insurance, I understand that the proposal for insurance affects premia to a definite amount at the beginning of the war; do you understand that those premia can be varied during the war—can they, for instance, be raised?—By the scheme which is being put forward they may be reduced but not raised.

441. It is at the beginning of the war the risks to British shipping would be at their largest?—Probably.

442. Therefore, probably at the beginning of the war there would be every desire to have those premia pretty high, and if the scheme is to be self-supporting the premia would have to be high at the beginning of the war?—Apparently so.

443. So that it is scarcely accurate to say that the scheme of insurance and the scheme which you propose of taxes to be raised in the first instance on shipping and cargoes are absolutely on all fours in that particular?—I do not think they are at all on all fours.

444. (*Mr. Llewellyn Smith.*) You would not give any indemnity, I take it, if the ship was not obeying the orders of the Admiralty?—None whatever.

445. But you would have no machinery, would you, for securing that the orders of the Admiralty would be known to the owner of the ship? Of course, you would make the endeavour, but you would not be able to secure it absolutely?—No. The scheme I have in my mind would be that the Board of Claims would assemble, and the shipowner would be required to prove his loss, and the Admiralty would be asked if they wished to prove disobedience. Providing the Admiralty did not prove disobedience to the orders in any way the claim would be paid. That is the idea I had in my mind.

446. If the owner of the ship could show that he had not, in fact, received the order, and was not acquainted with it, would he still get his indemnity?—Yes.

447. With regard to the question of Admiralty control, there is a paragraph in an Admiralty Memorandum on the lessons of the late manœuvres to the effect that the recent manœuvres have shown that, at any rate, at the commencement of war it is inadvisable to control the mercantile marine too closely. I need hardly ask whether you agree with that?—I agree with it. We wish to make use, as far as possible, of the initiative and expert knowledge of the captains of vessels, and for them to use every dodge they can for getting away, because we know that they know a great deal about it, at least some of them do; and some of them perhaps have already had the opportunity. Generally speaking they showed themselves very competent to avoid capture in the late war.

448. It is just at the beginning of a war when the losses will be greatest, I presume?—That is rather a matter of strategy.

449. Is it probable?—It is probable only if the enemy takes up from the beginning a policy of a *guerre de course*. If that comes later, the losses will be later. He might try to fight first, and then give it up and take to the other. The losses will be temporarily heavy.

450. I want to put to you an argument which has been suggested: That if we give this indemnity free of all charge, it will be more easy for the Admiralty to frame more stringent rules than if shipowners were left to insure themselves. I gather that you are not in favour of very stringent control?—I am in favour of any orders that we do issue being enforced, and of a strong method of enforcing them. That was shown to be necessary in Pitt's time, because Pitt's Convoy Act provided very heavy fines indeed for disobedience.

451. The stringency would be in the enforcement?—Yes; not in the minuteness of the rules.

452. There was one thing you said which interested me very much. You consider there are certain reasons why it is undesirable that the private insurance of war risks should go on, because it gives a large body of underwriters an inducement to try and find out and to be acquainted with the movements of the fleet, and that the more people who know those, the greater the danger of leakage?—Yes.

453. Do you attach great importance to that, because it is a very important point?—It is, to my mind.

453*. In some of the earlier schemes that have been drawn up, and in some of the earlier discussions on the question, it has been rather assumed the other way—namely, that it was desirable that the State

should do as little as possible, and leave as much to the private underwriter as possible. It is a new consideration to me that the Admiralty should consider that, on its merits, it is advisable to wipe out the private insurance of war risks on that ground?—To my mind it is advisable to do so. I will not say that that is the Admiralty view, because the matter has not been before the Board for their consideration.

454. The point is whether we want to leave as much to private people as possible, or to take as much away as possible?—I should leave as much as possible to the initiative of the masters of the merchant vessels themselves.

455. I mean, as much of the ordinary business of underwriting as possible—the smaller risks, for example?—There again there is a good deal to be said on both sides, to my mind. It is very desirable that we should have our interests and the underwriters' interests as much as possible identical. But I want to keep the State as clear of insurance difficulties and pitfalls as possible, and, for that reason, to give a definite offer of what the State will do without entering into the question of insurance.

456. You would not only leave the shipowner and the owner of the cargo to insure what you call the minor war risks with Lloyd's, or underwriters, but you would compel him to do so as a condition of getting the indemnity, if I understand scheme C?—That is in scheme C, but I am not very clear about that in my own mind.

457. I am referring to III. (a), "the ship must be insured against minor war risks"?—I should prefer to leave that to this Committee to find out if it was essential or otherwise. The advantage of it is that you would have the underwriters on our side in preventing fraud, but the disadvantage is that it means that you are interfering with the liberty of the subject to a certain extent. The insurance or otherwise of the minor war risks should, as a matter of first principles, be left to the man's own individual judgment, and the State ought not to interfere. But I think there are very many pros and cons about III. (a).

458. If you did not do that, would you not run the risk that the shipmaster, having to choose between incurring the big risk of capture or the minor risk of demurrage, deviation, and so on, would have a positive inducement to risk capture in each case?—Yes, it is possible.

459. Because he is not insured against the other thing?—It does seem that that is possible.

460. It seems to me then that it is absolutely essential to compel him to insure the minor risks?—I would take your opinion in preference to my own.

461. It is only a general opinion. But I must take you to the next step: if that is so, you would still have the underwriters as a body trying to find out the movements of the fleet, so you will not get out of that difficulty?—Apparently you will have that difficulty; you will only reduce it.

462. You suggested that the raising of the money by a fixed premium was inequitable in some ways. I can quite understand the argument that it would all fall on the British ship, whereas your scheme of tonnage dues would fall on the neutral, but I do not think that is what you meant. You meant, did you not, that it is not graduated according to the risks?—I meant that it is not graduated according to the risks. Supposing it is fixed at 2 per cent., some of the risks will be perhaps ½ per cent., and the man is not going to pay 2 per cent. for those.

463. He will go to the private underwriter?—Yes, he will. The scheme is based on the assumption that you obtain the 2 per cent. on the whole of the shipping. Obviously if some of the risks are less, the risks which are less than the 2 per cent. will not be insured by the Government, and there will be that much of the sum which had been estimated to be obtained which will not be obtained. Presumably the risks which will be insured will be the big risks. The 5 per cent. risks the people, of course, will insure at the 2 per cent., and naturally that will be bad business for the Government.

464. The particular suggestion that was made to the Royal Commission by Mr. Wilding was a much higher figure; he mentioned 5 per cent., I think?—I remember that.

465. His deliberate intention was to leave all risks below that to the operations of the ordinary insurance market?—Yes, I remember that scheme.

466. It was done as part of a policy that the State should not take over the great bulk of the risks, but only the big risks?—I was speaking for the moment of the 2 per cent. scheme that has been calculated.

467. With regard to the particular minor risks that you have in your mind, would they be chiefly applicable to neutral vessels—would they be risks of the kind neutral vessels also would run?—No, I think not if the belligerent abided by treaty declarations.

468. In the present state of human nature, and with the experience of recent years, do you say that?—I think the greatest danger we have to consider, that is, the greatest danger I apprehend, is if our enemy and a strong neutral are acting more or less in collusion, all the risks to the neutral go out entirely.

469. In the late Russo-Japanese war there were high premiums paid by neutrals not carrying contraband, I think?—Yes, and I have explained the reasons.

470. You think they would not operate again, because you say there was no agreement as to contraband; but there is no agreement now, and no prospect of an agreement?—Quite so; but all this is cut out in the greatest danger we can be subjected to of collusion between our enemy and a strong neutral, because the enemy may not interfere with neutrals at all as the best means of ruining us.

471. That may be the greatest danger you think?—Yes. In other cases I admit the neutral would run some war risk, as the term "contraband" is in a most deplorably unsettled state.

472. You spoke of the possibility of the enemy trying to bring us to our knees by encouraging the wholesale transfer of ships to neutral flags; but I did not quite follow you in what way we could possibly be brought to our knees by the transfer of our vessels to neutral flags. It might be very bad for the nation of course, but they would still carry supplies backwards and forwards, perhaps even more safely?—Yes, but would it not ruin individuals for one thing?

473. The transfer?—Is it not probable that wholesale transference would?

474. They probably would not transfer the ships for nothing?—It is rather a large disturbance of commercial interests.

475. I see the ultimate weakening of our mercantile position, of course, but I do not quite see the bearing of it on the fortunes of war, unless you mean that the vessels which the Government itself would require for transport would be transferred?—No, I did not mean that. What I had in my mind was the dislocation of commercial interests and business.

476. If it is such an easy process that it can be carried out, would it dislocate? Another flag would be flown, of course, but the vessel would go on?—I admit that it is very much open to argument.

477. You would compensate British ships trading between neutral ports, but not the cargo, I think?—The cargo is by treaty immune, and I think we had better assume that this treaty will be carried out.

478. What interest have we as a nation in guaranteeing the Masters of British ships not trading between the United Kingdom and other countries, who are not concerned with our supplies, either going out or coming in?—I take my stand on broad lines. The State makes the war, and the State should bear the loss due directly to the action of the enemy. I do not think it is good that the State should allow any individual to suffer in the prosecution of his trade.

479. That is a much wider proposition, really?—Yes, I take it widely.

480. You say we might differentiate between different kinds of cargo in charging the dues. Would it not be a much simpler method to differentiate between the benefits that we gave in the way of an indemnity, confining them, say, to necessaries, and say, "We will not indemnify the diamonds"? Presuming you want to favour necessaries as against luxuries, would it not be much simpler to reduce the indemnity for the luxuries, say, give only half or something of that sort, than to try to graduate it?—I read the arguments on that point in the Report of the Royal Com-

[*Captain H. Jones.* 12 Dec. 1906.

mission, and I came to the conclusion that the general opinion seemed to be that it was impracticable to distinguish. I quite agree with you as to the diamonds; I do not think you ought to allow diamonds to be taken as an ordinary war risk, and I would put a prohibitive tax upon them to discourage their being carried then.

481. You were asked just now what injury would be done to the State by the transfer of British vessels to another flag, which would give the reason for such indemnity; do you, as an Admiralty representative, attach any importance to the maintenance of the mercantile marine under the British flag?—Not from a purely Admiralty point of view, but from the country's point of view, yes. Admitting that transfer takes place, it is evident that it will be a forced sale, and that means that the bargain will be all in favour of the neutral who buys and against the belligerent who sells.

482. Your objection to transfer is not the loss of the British mercantile marine—that is, not the transfer itself, but merely that the transfer would be made under circumstances which would make it necessarily a bad bargain?—Yes; I believe that it would mean a national loss—of course it is a loss directly to the individual, but it becomes part of the national loss.

483. Do I understand you to go so far as to say that it is immaterial whether we have a mercantile marine or not?—Certainly not. I think it would be very material that we should have one.

484. I thought you were saying the other thing, and that is what I wanted to be sure upon?—I say no, certainly not.

485. (*Sir George Clarke.*) I am still not quite clear about the dues question. Your dues could not be adjusted to meet the real risks of war, could they?—I do not believe that any fixed dues can be, because nobody knows what the risks of war are.

486. And also the premiums could not be scientifically adjusted to meet the risks of war?—I believe they cannot be.

487. Therefore from that point of view, and from that point of view alone—do not go now into the question of the Government doing business—the two ideas are absolutely on all-fours, that is for the adjustment of means to ends they are both on all-fours?—Yes.

488. Do you propose to raise those dues in colonial ports?—It would be better if you could do so, but we must do what is practicable. You will have difficulty enough to get the United Kingdom to agree to it, I suppose. It would be better if you could treat it as an Imperial question, but I suppose that is not within practical politics yet.

489. If it proves impossible to impose them in colonial ports, should colonial ships have the advantages of the indemnity?—I should say not. May I add this? According to scheme C, under III. (b), "the shipowner must comply with any directions issued by the Admiralty with regard to route and navigation of the ship." I should prefer that the words after "Admiralty" should go out, because some of our directions might not concern route or navigation.

490. (*Sir George Murray.*) What else could they concern?—We might wish to tell a merchant ship he was being chased, and there was one place where he could run, and he should run there.

491. (*Chairman.*) That would concern both the route and the navigation, would it not?—Yes, it would. Possibly lights might come in under that. In case of his being in dangerous waters we might say, It is better you should get out of the track and anchor and put your lights out; that would be better for your safety. I think there are possibilities.

492. (*Mr. Jackson.*) That would be part of route and navigation, too, would it not?—Yes, it would. Perhaps it might all be brought in under those words.

FOURTH DAY.

Tuesday, 19*th February* 1907.

PRESENT:

Sir GEORGE H. MURRAY, K.C.B. (*in the Chair*).

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Captain C. L. OTTLEY, R.N., M.V.O.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. FREDERICK HUTH JACKSON.

Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. F. LEVERTON HARRIS, called and examined.

Mr F. L. Harris. 19 Feb. 1907.

Mr. Leverton Harris, in a preliminary memorandum,* had submitted:—

(1) That the cost of war insurance in a great maritime war would add so greatly to the cost of raw material that trade would be seriously affected, and a large number of persons would lose their employment, to the grave peril of the country.

(2) That *bonâ-fide* transfers are easily effected, and that the carrying trade would be drawn away from British vessels to vessels owned by foreign competitors.

(3) That gratuitous indemnity is to be preferred to any scheme of State insurance.

(4) That national indemnity would not constitute a bounty to shipowners or merchants, but would directly benefit the consumer.

(5) That it is impossible to frame any reliable estimate of the cost to the State of any scheme of either partial insurance or gratuitous indemnity.

(6) That commerce destruction is to be anticipated as part of the policy of an enemy, and that the mere presence of commerce destroyers, or the belief that such destroyers were on any of the trade routes, would entail very heavy premiums for war risks.

493. (*Sir George Murray.*) I think you have seen the terms of our reference?—Yes, I have.

494. And you have had practical experience as a shipowner and also experience of marine insurance?—Yes. I was for about 16 years in, I suppose, one of the oldest shipowning and insurance firms in the City of London, and during most of that time I had control of the insurance department. We dealt principally with the insurance of hulls of steamers; that was the speciality in which my firm was engaged. I had a good deal of experience at Lloyd's as a broker, and at the present time I am an underwriting member of Lloyd's.

495. I think you gave evidence before the Food Supply Commission?—I did.

496. I think you may take it that we have read the evidence you gave on that occasion?—Quite so.

497. But I will just ask you one or two general questions. First, whether you are in favour of the

* *Vide* note, p. iii.

State undertaking to make good to shipowners and traders the losses incurred by capture in time of war?—Yes, I am in favour of it.

498. On the ground of the great national danger of our oversea trade being suspended and in order to keep our shipping afloat?—Yes. What appeals to me most is the risk in time of war of interference with the import of raw materials into this country, and the export of the finished article, and the great social danger which would arise in this country in the event of our supply of raw materials either being cut off or raised to such a price that we as an industrial nation would be unable to compete with rival manufacturers in other countries. To illustrate my fears, I gave some figures in a letter of mine which the "Times" published in September, 1905.

499. Yes, I think I remember that?—I think the figures are also in that paper.

500. You took the case of a steamer of 5,000 tons, valued at £30,000?—That is the case.

501. And the conclusion you drew from that was that the shipowner's cost would be increased to about £7,300?—Perhaps I might be permitted to interrupt you? That was the case I gave in connection with the "Wakefield" steamer, with a cargo of grain from America. I think the case to which I referred, of the effect of insurance rates upon the price of raw materials, was given in a letter of mine to "The Times," in September, 1905. It is on page 3 of the statement of evidence that I sent in.

502. Could you just recapitulate that statement?—Certainly. I take an imaginary steamer of 5,000 tons dead weight, and of a value of £30,000. I presume that that vessel is trading from this country to Spain, going out in ballast and coming home with a cargo of iron ore. I take an imaginary rate, which I should like to state is absolutely imaginary, a rate of 5 guineas per cent., as the extra cost of war risk insurance in consequence of hostilities.

503. When you say it is imaginary, I suppose you mean it is not very far from what you think the rate would be or might be?—I do not think I have any settled convictions in my head as to what rates are likely to be. When I first began to consider the subject, I thought that one might be able to assume certain rates of insurance as possible rates in time of war. Now I have come to the conclusion that it is absolutely fruitless to attempt to fix any sort of standard rate, or any imaginary rate at all. I am taking a rate which was given before the Food Supply Commission by Mr. Jones, the underwriter of the Commercial Union Insurance Company, as to what he thought might be the rate for a Channel voyage on cargo or on hulls of steamers crossing the Channel in the event of our being at war with a European Power. Of course, it is very vague, but that was the rate he thought might be charged, a rate of 5 guineas per cent. I am taking his rate simply for the purpose of giving an illustration. I do not say I agree with it; I do not disagree with it but I do not think anybody can say at all what rates are likely to be in a war. I think it is absolutely impossible. But I simply assume that rate for the purpose of illustration. I assume that there is a 5,000 tons "dead weight" steamer, valued at £30,000, a vessel that carries 5,000 tons of ore. I assume there is an insurance rate of 5 guineas per cent., that the vessel goes out in ballast to Spain, and comes home with a cargo of iron ore to this country. The extra insurance on the steamer would amount to £3,150. That is 5 guineas per cent. for the voyage out, and 5 guineas per cent. for the voyage home, on a value of £30,000. I take the 5,000 tons of iron ore at a value of £4,000, and I charge that with 5 guineas per cent. as the insurance of that iron ore. That is an additional £210. These two additional charges I maintain would fall upon the purchaser of the ore. They would be practically added to the freight. They would be a charge that the purchaser of the ore eventually would have to pay. That raises the value of the ore from £4,000 to £7,300, at any rate. I believe we obtain 30 per cent. of the ore used in this country from Spain, and if iron ore coming from Spain is raised by something like 70 or 80 per cent., I say that this country would be so seriously handicapped in competing with foreign countries who are manufacturing iron and steel goods, that it would mean that many of our manufactories in this country manufacturing products of iron and steel would have to be closed. It would mean that hundreds and thousands of hands would be thrown out of employment. Applying the same process of argument to other industries, the cotton industry, the flax industry, the jute industry, and so on, I see in the cost of insurance in time of war a great internal national danger to this country. That is one of the reasons why I support national indemnity. It applies equally to national insurance, of course, but that is one of the reasons why I support a scheme of national indemnity or national insurance. I will come to the more detailed reasons why I support one against the other in a moment. The second reason is because, in the event of war, and the owners of British ships having to pay high rates of war insurance, and the shippers by those ships having also to pay high rates on their cargoes for war insurance, I foresee that our trade might be driven into the hands of neutrals, and probably would be driven into the hands of neutral shipping, and, judging partly from experience in the past, and partly from what one anticipates would be likely to happen in the future, I think that would be a very grave danger to the mercantile marine of this country, and the supremacy which it holds amongst other countries. Those are the two reasons that appeal to me. First of all, the internal danger of an enormous mass of the population being thrown out of employment, which is a much greater danger, in my opinion, than any question that would arise from the increased cost of food and, secondly, the danger of our mercantile naval supremacy being taken away from us and given to other countries.

504. You do not attach much importance, then, to the difficulty of keeping up our food supply?—I think that a working man in this country, if he were getting wages, could well afford to pay twice the price he has to pay for his food at the present time. Of course, it would make some difference, but my opinion is that the question of employment is an infinitely greater question than the question of food. A man out of employment cannot buy food, however cheap it is, and of course if it is raised in price it will affect him all the more. A man who is in employment can afford to pay a rise in the price of food—such a rise as was anticipated in the Report of the Food Supply Commissioners. I do not think it would be really a serious burden to him if he had to pay a shilling for a loaf of bread instead of 5d. He could afford to do it; he could keep body and soul together. But if you had several million working men and women in this country employed in the iron trade, employed in the cotton trade, and so on, thrown out of employment, then you would have a much graver national danger than the danger that would occur in consequence of an increase in the price of food.

505. Then, in addition to that there would be the danger to our shipping industry as an industry itself?—Quite so. At the time of the American Civil War there were, on the 27th December, 1862, just upon half a million people out of work in Lancashire alone. That is given as showing the effect of war upon the import of raw material. Of course, it was a war, as it were, from the other end. It was a war that we were not engaged in, but it had the effect of interfering with our supplies of raw material. Half a million hands were out of work in Lancashire; and in November, 1863, the price of New Orleans middling cotton rose to 29½d. per lb., as against 5d. to 6d. before the war.

506. Then, as regards the case of the shipping industry, you anticipate that there would be a very large amount of transfer of British shipping to neutral ownership?—Yes, I think there would be.

507. And you think that is a matter that is easily done?—Perhaps I may be permitted just to give a case that came to my experience only the week before last. A certain firm in the City of London wished to employ a steamer in a particular trade. They were, however, prevented by what was considered a rather obsolete regulation. It was with regard to the carriage of coolies from a certain country to another country, and by an old regulation made a considerable number of years ago the particular business was prohibited. The point came up, how was this to be got over? What ultimately was done was this. A clerk was sent over to Belgium; he registered a limited company there, and put up a brass plate on the door of an office. The limited company bought all the shares in this steamer; automatically she was removed

Mr. F. L. Harris.

19 Feb. 1907.

from the British register, and she became a Belgian ship. The whole thing was done, I think, in four days, without the slightest trouble at all. I do not think there is any difficulty for transfer, certainly not for *bonâ fide* transfer. I do not know whether one would call that a *bonâ fide* transfer or not, but there is very little difficulty for any *bonâ fide* transfer.

508. Do you imagine that a belligerent would readily recognise a transfer of that kind?—I do not know whether he would, but it would be very difficult in time of war for a belligerent, I imagine, to interfere with a vessel flying another country's flag. They might say they would not recognise it, but it would be very difficult to give effect to that, I think. Of course, I believe the transfer would have to be a *bonâ fide* transfer—an actual sale from the country to neutral countries.

509. Then it would not be the case that you describe of something like a bogus company being formed?—I do not think so. I think there would be quite a sufficient inducement for the neutral shipowner to purchase British tonnage, and quite a sufficient inducement for the British shipowner to sell his tonnage to neutral owners. I would refer you to my evidence on this point before the Food Supply Commission.

510. That is the "Wakefield" case?—That is the "Wakefield" case.

511. That is the case of a steamer brought from the Tyne to America, and back to Manchester with a cargo of wheat?—Yes, that is the case.

512. The actual cost of running that steamer for that voyage you take at £1,653 in time of peace?—Quite so.

513. In time of war the cost of the war risk insurance would have brought it up to about £3,000 more?—I again, purely for the sake of an illustration, take the war risk premium at 5 per cent. for the Atlantic voyage. It may be too high, it may be too low; I do not think anybody can possibly say, but I take it simply for the purpose of illustration. That means, on the voyage out and home, £3,000 additional for war risk insurance put on to the cost of running that steamer, bringing the cost of running the steamer up from £1,600 to £4,500.

514. Apart from extra insurance on the cargo?—Apart from that.

515. Which in this case you would put at about £1,080?—Yes, 14,400 quarters of wheat, representing a value of about £21,600; the cost of insurance, at 5 per cent., being £1,080.

516. And that would be a sort of premium on neutral shipping?—Yes.

517. It would be an advantage to the neutral shipowner to that amount?—Quite so. The actual out-of-pocket expenses for the carriage of that cargo, if shipped in a British vessel, are on the other hand raised from £1,600 to £6,023. I maintain that a merchant shipping by a neutral steamer would not have to meet an increased cost of carriage very greatly exceeding what the cost would be in normal times. It might be a little more. But the merchant shipping by a British ship would have the actual net cost of the carriage of a cargo of wheat, not taking profit into account, raised, assuming that the war risk premium was 5 per cent., from £1,600 to over £6,000. I draw a conclusion from that that no merchant having to face that great difference would choose a British ship to ship by.

518. In fact, British shipping would have to be laid up in consequence of the increased charge?—Yes, or transferred.

519. The whole of your argument, of course, depends upon there being this high war risk?—Quite so, absolutely.

520. Supposing the circumstances were such as not to send up the war premium at all, of course there would be no necessity for either national indemnity or any other scheme of the kind?—No, not the slightest.

521. You cannot form any opinion of what the probability of a high rate of war insurance is?—Of course, there are all sorts of cases that have occurred in the past which one can take, but I think it is futile really to try to come to any conclusion as to what premiums are going to be in a future war. Take the Japanese and Russian war. We have got cases where, for the same voyage, within a very few weeks, simply owing to the risk having increased, the rate has gone up from a few shillings to 50 or 60 guineas per cent. It depends altogether on the whole distribution of your forces. It also depends on whether the underwriters at Lloyd's are frightened that it is possible that certain vessels will be captured. I think myself that if it were known at Lloyd's that a fast commerce destroyer was in the Atlantic, you would have the rate on Atlantic voyages a great deal above 5 per cent. for the war risk, both on the ship and on the cargo.

522. Of course, the whole thing really depends upon the condition of our own Navy to begin with, and the Power that we happen to be at war with in the second place?—Yes, largely. It also depends, I think, on a sort of sentimental idea, as one may perhaps call it, that Lloyd's forms as regards the chance of capture. It does not depend on the actual capture so much as on the fear of capture—panic.

523. One of the objections to any scheme of this kind that has been urged is that it would be a special form of assistance to one particular kind of industry. Have you anything to say on that point?—Yes. At first sight this question seems to suggest that it is proposed to give special privilege in the nature of a bounty to shipowners and traders only. This is really not the case. The cost of insurance, whether upon the vessel that carries the goods or upon the goods themselves, inevitably must fall upon the consumer of those goods. In estimating the freight which a shipowner has to charge for the carriage of a cargo, he invariably takes into consideration all charges which he has to pay. Insurance is one of these, and whether it be ordinary insurance against marine perils or special insurance against the risk of loss or capture by an enemy, that charge will of necessity be added to the freight which is charged the merchant whose goods are to be carried. In the same way, when the merchant comes to realise his cargo he adds to the cost of the cargo what he has had to pay for the carriage and insurance of it. Increase or decrease the cost of insurance, either on the ship or on the cargo, and you inevitably increase or decrease what the consumer has to pay when he comes to purchase it. I desire therefore to join issue with those who seek to maintain that any indemnity or contribution towards the cost of war losses that the State may make is of the nature of a subsidy to shipowners and merchants alone. The point I wish to make is this, that it falls on the cargo. It is the consumer of the cargo who is going to get the benefit. Just as the consumer of the cargo would have to pay the additional cost of war insurance on the vessel that carries the cargo and on the cargo itself, so the consumer of the cargo is going to get the benefit of any indemnity that the State may grant.

524. Must you not separate the case of the shipowner from the cargo owner, because in one of the events which you contemplated, namely, that the British shipowner would be driven off the sea and the whole business left to the neutral shipowner, there would be no burden on the cargo owner at all, as his rates would not rise?—I do not agree; the neutral shipowner will not be prepared to carry the goods at a small profit. You see he will be in this position: Going back to the case of the "Wakefield," the cost of the carriage on her cargo is raised from something like £1,600 up to £6,000. At a freight of less than £6,000 the goods would not be carried in a British ship, because that ship would be running at a loss. The neutral shipowner will not be satisfied to run at £1,600, as he was in time of peace, but he will say, "My freight shall be £5,800, at which price the British shipowner would be running at a small loss, and therefore I need not fear him, but I will get as much as I can out of the merchant who is shipping the cargo." Therefore the consumer has to pay practically the same; the consumer gets no benefit by neutral shipping carrying the goods, because inevitably the neutral shipowner will get every penny he can in the way of freight, and the height of that freight will only be limited by the point at which the British shipowner can come into the market.

525. Would not the competition between the neutral shipowners keep that down?—I do not think so, because the neutral shipping I think is only half the shipping of the world.

526. Yes, but on the assumption you were making that a vast amount of British shipping would be trans-

ferred to neutral flags there would be a considerable additional supply of neutral shipping?—Certainly, but there would not be more shipping available than there would be at the present time. A certain amount would be laid up; a certain amount would not be transferred. Some vessels might be captured or destroyed. Probably there would be a shortage in available shipping, and probably the neutral shipowner would be able to get a freight very nearly approximating to, but a little bit under, what the British shipowner would be able to sail his vessel for. So that I try to make the case that the consumer does not save, or saves only very little, by shipping in neutral bottoms.

527. Then coming to the form that this indemnity would take, are you in favour of what we call indemnity or insurance?—I am in favour of indemnity, because insurance though making the evil less aggravated, does not remove it. Besides that, I see the very greatest difficulty and the greatest complications with regard to insurance. I would like to refer to a proposal that was made in "The Times" in November, 1905, in the second of two letters which appeared in that paper; I think the first letter appeared in October, and the second was in November, 1905. There a most extraordinary proposal was made. I will not go into the question of the errors in the mathematical part of that proposal, the figures of which are worked out in rather a loose fashion, but I will take simply what the proposal itself is. The value of British ships engaged in foreign trade is taken at £89,000,000. The value of cargoes afloat at one time is taken at £91,000,000. Each vessel is assumed to make four complete voyages in a year, and to carry 1½ full cargoes for each complete voyage. A complete voyage is a voyage out and home. The value of the cargoes per annum then, the letter says, would be £726,000,000. I think it ought to be £546,000,000, and not £726,000,000.

528. Six times £91,000,000, I suppose?—Six times £91,000,000. There is a mistake of £180,000,000 in that figure. I will take the figure that is put in the letter, just to follow the argument. A certain deduction is made from that for the possible captures during the year. The value of the shipping, £89,000,000, and the gross value of the cargo, £726,000,000, less 2½ per cent. in each case for captures during the year, are charged with a 2 per cent. premium. That gives a yearly revenue of £14,157,000 from the cargo, and £1,754,500 from the shipping, together £15,911,500. Of course the fallacy of this scheme is this, that you are charging 2 per cent. per annum on the value of your shipping, but on your cargoes you are charging 2 per cent. per voyage. Let me take a case in point, and apply to it this proposed scheme. Imagine a steamer running across the Channel from this country to the Continent. She makes forty voyages in the year. You are charging 2 per cent. per annum for war risk insurance as the premium that the shipowner has to pay to the State. That is a shilling per cent. per voyage. But the cargo she carries has under this proposal to pay 2 per cent. per voyage. I do not think any scheme of that nature would be possible; the inequality of it would be so manifest, so extreme.

529. That could be easily remedied, of course, by either reducing the rate on the cargo or raising the rate on the ship?—It could, but I am only taking that as one of the schemes that have been put forward. When you come to fix a universal premium, my experience at Lloyds tells me at once you will land yourself in the most fearful difficulties. It must be inequitable; it would be very hard on some. Of course you could say they need not insure. It will be insufficient in other cases, and I do not believe it would be workable. I do not believe it would give satisfaction. I think it would give cause for great complaint. I do not say that it would not be possible to have some scheme of variable premium, but I do not think any scheme of universal premium would be possible.

530. Not even a very low one?—I do not think it is possible.

531. Suppose you put it even as low as a quarter per cent.?—That is like a sort of stamp duty?

532. Yes?—I should not object to that.

533. That would bring in a considerable revenue, according to the figures that you have been quoting?—Yes.

534. Then you think any form of insurance, that is the taking of any premium, would probably upset the scheme?—I think it would all tend to drive British shipping to neutrals. Whatever form it takes, as long as there is a premium charged, that premium would fall as a handicap on British shipping. It would be paid by the consumer, and although it might give something back to the taxpayer of the country, it would all be taken out of the consumer's pocket.

535. Then it comes to this, that if the British shipowner is to be put on an equality with the neutral shipowner he must have his indemnity free of charge?—Quite so.

536. Coming to the practical difficulties of an indemnity, do you see anything in that?—I think the great difficulty will be the difficulty of fixing value. That appears to me to be the greatest difficulty that would have to be faced.

537. Would there be any greater difficulty in doing that than there is now in fixing the value of the ship and cargo for insurance purposes?—I think there would be, because in an indemnity the State is giving something free. Whereas the value at present that is fixed for ordinary purposes of marine insurance is a matter of arrangement between the underwriter and the shipowner. Let me take a case for illustration. Two shipowners own two sister steamers; one has been very unfortunate in her trading, the other has been very fortunate. The one that has been fortunate has had large sums of money put to the writing down of her value, and she is insured for a comparatively small sum. We will say, for the sake of argument, she is insured for £20,000. The other vessel has been unfortunate, and her value has not been written down in the books of her owner, and she is insured for £40,000. They are exactly sister ships. The difficulty that I think would occur, supposing those two vessels are captured, would be this: In one case the State pays one shipowner £20,000, in the other case the State pays the other shipowner £40,000. The man who has got £20,000 says: This is altogether unfair; why should my competitor get £40,000 as a contribution from the State for the loss of his vessel, which is an exactly similar vessel to mine, and I have only got £20,000? In ordinary insurance it is simply a matter of arrangement. The man who insures his vessel for £20,000 is escaping so much premium as compared with the shipowner who is insuring his vessel for £40,000. It suits him to do it. The other shipowner cannot afford to insure for less than £40,000 in case his vessel is lost, since the capital of his company would not be intact.

538. But in the case we are assuming of there being no insurance, each of them would get the real value, so far as could be ascertained, of his ship and cargo?—Yes. The difficulty is to fix what you mean by real value.

539. Would there be much practical difficulty in doing that?—No; I think a valuer can tell you within 10 per cent., as a rule, the value of a vessel and her cargo. I think any firm of shipping experts could turn up a vessel in Lloyd's Register, unless she is engaged in some special trade where she is earning large profits, and say that vessel in the market to-day is worth so much, and probably it would be within 10 per cent. of the correct valuation, but in war time the value might be continually fluctuating.

540. Then how would you deal with the cargo?—The cargo is very easy to value.

541. You think there would be no difficulty?—I think there would be no difficulty in valuing the cargo. Now and then there would be exceptions, but in all the great cargo trades the prices of cargoes are regulated by every-day quotations; grain, sugar, cotton, tobacco—everything is practically regulated as a day-to-day quotation. I do not think there would be any difficulty with the cargo at all. Every day for the purpose of average adjustment the values of cargoes are fixed.

542. Would you value the cargo at the port of shipment, or the port of discharge, or in some other way?—I think that is purely a matter of arrangement. I should not allow the shipper any profit at all on his cargo. I should include his freight, if he has had to pay his freight, but I would not give him any profit on his cargo. If he wants a profit on his cargo that is his own affair, and he must insure it separately.

543. Of course, the great object would be to prevent his having to insure anything, would it not?—It would be, but I think it would be open to a great deal of question if the State gave more than the actual value of the cargo at the port of shipment, plus the charges of bringing it to this country.

Mr. F. L. Harris.

19 Feb. 1907.

544. Do you contemplate indemnity in the case of cargoes in British ships carried between neutral ports?—I should like to see it, yes. I think that again is a matter of how far the State would be inclined to go. First of all one would naturally like to see the indemnity given to ships and to cargoes carried by vessels engaged in trade between British ports, and if the State would go further, then certainly I should like to see it given to those engaged between neutral ports.

545. If its object was to keep the British shipping trade from going, it would be almost essential to carry it as far as that, would it not?—I do not know whether it would be essential, but it would be very important. But the other object does not come in in the case of cargoes being carried between neutral ports; that is the object of keeping the price of raw material low in this country, which to my mind is as great an object almost as the object of keeping shipping in the hands of shipowners of this country. To my mind it would be far more important really to give the indemnity to vessels engaged between British ports, or engaged between foreign ports and a British port, than to British vessels engaged all over the world. But I should like to see it applied to all.

546. (*Sir George Clarke.*) I think you have said in your evidence and in "The Times" that in the present circumstances high insurance rates would cause practically a panic in commercial circles generally?—Yes; high insurances would, I think.

547. You said British vessels would be practically uninsurable, and freights would rise to a prohibitive point?—They might, yes.

548. But you do not consider that the loss of one ship would justify that serious cost. What you mean is that that view would be taken whether it was a reasonable one or not, and that that was the point we had to consider?—I think the loss of one ship might temporarily raise insurance rates to a very extreme point, provided that the vessel was still at large which had captured that ship.

549. In your evidence before the Royal Commission you said that the market for war insurance was very small, and that those who undertook that kind of business were always inclined to demand high rates. You think we might regard that as a universal law?—Yes; the market is comparatively a small market.

550. And you also said in evidence that there would always be a tendency for the underwriter to get as much premium as he could; that anything which would scare the shipowner would naturally increase the premium he could demand, and that these premiums would probably be found to be out of all proportion to the actual risk incurred. Then you think there would always be that tendency to gross exaggeration of the risks?—I think that an underwriter would try to get as much as he could. I do not say there would always be a tendency to gross exaggeration, because it is very difficult for an underwriter absolutely to estimate the risk. We have the case in the Japanese war, for the underwriters' estimate was proved to be too low at the end of the war.

551. But the tendency would be to over-estimate the risk?—I think it would.

552. You think that if the State could put any check on the danger which exists without itself setting up an insurance office it would be a gain to this country?—Yes, I do.

553. Your plan is a plan of State indemnity?—Yes.

554. But you stated to the Royal Commission that while the State should indemnify loss it should refuse to take the risk in particularly dangerous areas?—Quite so. There would have to be certain regulations, I think.

555. Then you think that in the case of very dangerous areas the ship and cargo owner should contribute to the extra risk involved?—I do not think I said that, but I think a scheme of that nature might be found workable. For instance, freights no doubt will be highest in the most dangerous areas, and I think naturally the State would have to have certain regulations as to certain zones inside which they would not be responsible. It would be absurd, for instance, for the State to indemnify a shipowner who was running the blockade, or trying to run into a port which was practically in a state of blockade. That would be ridiculous. They would have to put restrictions; there would have to be regulations.

556. Your scheme of indemnity embodies the principle of contribution in certain cases, or contemplates such a contribution?—It was not part of my scheme. I say now that I think such a contribution might be a matter of arrangement, but I do not think it was part of my scheme.

557. But you are clear you would not let the State indemnify in the case of all particularly dangerous areas?—Certainly.

558. Therefore, in that case, unless there was some contribution which covered the insurance of the ship in those areas, the ship would have no protection whatever in those areas?—The State would not be responsible.

559. In your letter to "The Times" you said that in present conditions neutrals would be able to ask any freights they liked, and that they might be able to pay dividends as high as 100 per cent. on the capital value of their vessels?—Yes.

560. Are you clear that there would not be considerable competition among neutrals in such a case of the profits ranging so very high?—I think ultimately, when the mischief was done, and they had bought a large amount of tonnage from this country, then there might be compensation, but in the initial stages of the war neutral tonnage would not be sufficient to make any effect in the way of competition.

561. What I do not quite understand is this. If the shipping in this country had to pay the 5 guineas per cent. that Mr. R. T. Jones estimated it at, and even if a neutral was paying no insurance at all, why cannot a British ship, which has to pay the 5 guineas, cut into competition with a neutral who, you say, is going to make dividends of 100 per cent.?—Let me just illustrate that. Take a liner running in the Atlantic trade, running from here to America, and making 20 voyages a year, 10 out and 10 home. Imagine a rate of extra war risk of 5 per cent., which is not an excessive rate. There is 100 per cent. extra at once. Therefore, if the neutral charges the same freights as that British vessel, he is getting a clear 100 per cent. profit on his vessel, provided she is a sister ship of the other one. If he charges a little under that 100 per cent. the British vessel cannot afford to compete, whilst he is making a little less than 100 per cent. profit on the value of his vessel per annum.

562. But if the British shipowner can make his 100 per cent. dividends, as you say the neutral shipowner might, subject only to the 5 guineas per cent. insurance, would not the British shipowner be doing rather better business than he does in time of peace?—No, the British shipowner would make nothing.

563. The difference between the British shipowner and the neutral is only the 5 per cent.?—No, 5 per cent. per voyage, which is 100 per cent. per annum on such a vessel engaged in the Atlantic trade. I am assuming a premium of 5 per cent. on a liner engaged in the Atlantic trade. The British shipowner has to pay 100 per cent. per annum for war risk insurance, that is 5 per cent. each voyage out, and 5 per cent. each voyage home, and that 100 per cent. per annum would be all profit to the neutral running in competition and getting the same freight. Therefore the neutral could get, say, 99 per cent. on the value of his vessel, whilst the British shipowner would be running at a loss.

564. But you do not maintain that British ships could afford to pay nothing towards the cost of purchasing the indemnity; you do not assume it would be impossible for them to pay something?—No, I do not say that at all. I think economically they could pay something, but I think that everything they pay would do more damage either to the country itself or to British shipping than the good that the country would obtain from such a payment.

565. (*Sir George Murray.*) What they pay would, in fact, be the measure of the difference in favour of the neutral shipowner?—Yes, and that does not take into account the extra cost of raw material in this country which would contribute to that payment, and the handicap that would be placed on the British manufacturer as compared with the manufacturer abroad. A very small handicap very often means a tremendous change in the centre of gravity of trade.

566. (*Sir George Clarke.*) If there were a general rate something like 2½ per cent., charged, would not the position of the ship and cargo owner be enormously

superior to what it is at the present moment?—Is that 2½ per cent. per voyage?

567. Yes?—In some cases it would be much worse than it is now. In some cases it would be better.

568. But suppose it was a variable premium depending on the nature of the voyage?—That is a different matter. Of course, if you are going to have a variable premium you must have an underwriting department. I did not know that that was in serious contemplation. If that is so, something might be worked, in which case he might be better off, but it would not cure the evil, to my mind.

569. But anything like a steady maximum which could not be exceeded under any circumstances would tend to prevent the terrible panic you have contemplated?—I think it would tend to prevent a panic, certainly.

570. In the case of the Belgian transfer that you referred to, would the Belgian Government confer the protection of its flag on such a ship in the case of a European war?—That is a difficult question. It is a question I could not answer.

571. But that would be the whole point, would it not, because the transfer must depend upon whether the ship was eventually to be clothed with the protection of the Belgian flag?—As long as it is a legal transfer I doubt whether the protection of the flag would be withheld.

572. Then there is the question of the officers and crews of the transferred ship. Are they to be denationalised, or to be supplied from some other source?—Of course, on board British shipping at the present time you would find, I think, 27 per cent. of their crews not belonging to this country.

573. Yes, but they might not be Belgians?—That is so.

574. Are they to be denationalised by the transfer?—No, they are not denationalised at all. They are still British subjects.

575. Might not that very much interfere with the neutral aspect of the transferred ship?—I was only giving that example to show how easy it was to effect a transfer. I said I hardly considered it a *bonâ-fide* transfer, and that I considered that the transfers in time of war would have to be *bonâ fide* transfers. That is a transfer which is absolutely legal. The case I mentioned is a transfer which, I think, in time of war might be open to question.

576. In time of war it would be subject to any laws of the State to which it was transferred, and which in some cases might prohibit it?—Yes.

577. If a ship was carrying what was laid down as contraband of war, what would be gained by transferring?—In such a case nothing would be gained, because the rate of insurance would be the same.

578. Therefore any article which a belligerent at war with us declared as contraband might just as well be carried in British ships as in neutral ships?—I do not go as far as that. I do not think it has ever been decided whether the ship itself is liable to capture. I mean it has never been decided whether she is not liable to be returned when she is carrying contraband of war. Of course, Japan has not returned her ships, but I have a quotation here from Lord Lansdowne in the Chamber of Shipping, 1904, in which he says "Neutral traders may carry on trade even in contraband with belligerents, subject to the right of capture of the goods." Then further on he said, I think, that it was not at all settled that the ship was liable to capture. I do not profess to be an expert in international law, but I do not think it has ever been settled, although it was held by Japan that the ships were liable to capture, and they have not returned them.

579. But if the cargoes in a particular line of trade were all liable to capture as having been declared contraband, the inducement to transfer those ships to a neutral flag would be very much reduced?—Yes. In fact, it is a very curious thing that in the eighteenth century the insurance rate on a neutral was higher than the insurance rate on the belligerent, for the reason that the belligerent had the protection of convoy and the neutral had not. Of course, then the flag did not cover the goods.

580. (*Captain Ottley.*) You said in answer to Sir George Murray, that it comes to this, that in order that British ships may continue to run in competition with neutrals in war time they must get their indemnity practically free?—Yes.

581. I was going to ask you whether perhaps the same result might not be arrived at if you could make the British ship and the neutral ship run on an absolute equality?—Yes.

582. The same result would be achieved?—So far as the shipping goes. I do not know how far it would affect the raw material question. So far as the shipping goes, provided the neutral and the British ship are on an absolute equality, I think that is all the British shipowner would want.

583. Then the British market is an enormous one, and one of immense value to the whole world?—Yes.

584. If you bring everything to a common denominator, neutral ship and British ship, is it not pretty certain that the competition between that vast body of shipping of various sorts would keep your prices level, or almost level?—No, I do not think so.

585. If you get your British and your neutral shipping absolutely on a par, then it appears to me that nothing comes in except the law of competition between ship and ship for cargo, and therefore the price to the British consumer would be as low as it was possible to have it?—No, I do not agree with you at all. For instance, let me take an illustration. You have got a cotton-spinner in Lancashire who wants some cotton. His principal competitor is a cotton-spinner in some other place, say Barcelona. Spain is not at war; we are. The British steamer carrying the cargo of cotton to that cotton-spinner in Lancashire is liable to capture. If you do not give an indemnity her owner has to pay a very heavy rate for insurance.

586. Let me frankly say I propose to give an indemnity?—An absolute indemnity?

587. Yes, an absolute indemnity?—Then I agree with you. I thought you were going to put some restriction on the neutral. I thought there was some idea in your mind to tax the neutral in some way, so as to level him up and not level the British owner down.

588. My proposal was to tax the neutral to the same extent as the British shipowner, in order to raise the fund?—Then you are taxing the British shipowner to a small amount?

589. Yes?—That tax on the British shipowner and the tax on the cargo falls on the consumer of the cargo. Therefore the cotton spinner in Lancashire is having to pay it. But the cotton spinner in Barcelona, Spain not being at war, is having to pay no tax.

590. Yes, I think that is so. I am bound to say I was thinking entirely of the effect on the raw material that was coming to this country?—Now let me go a little further, if I may. The cotton spinner in Lancashire is paying a tax, the cotton spinner in Barcelona is not paying a tax. Two-thirds of our cotton manufactured goods are exported. Take the neutral market of China or the Phillipines, for instance; a very small difference of price, as you know, a mere fraction of a penny in the yard, makes all the difference as to whether Barcelona would get the order or whether Lancashire would get the order. When the manufacturer in Lancashire is exporting his goods he also has to pay in his freight the cost of insurance on those goods going out, and on the ship that is carrying those goods out, so that by the time his finished goods have got to the market where he is competing with Barcelona, he has had to pay a tax on the vessel carrying the cargo; it may be a small tax, but he has had to pay a tax or a contribution, and he has had also to pay a contribution on the cargo itself. He has got to pay a contribution for the insurance of the finished article going out, and he has got to pay a contribution for the insurance of the vessel that is carrying the finished article. And all these charges would be in addition to the extra cost he has had to pay for his raw material. Then would come the question whether he can sell his goods in China, and if he cannot sell his goods he may as well shut up his factory.

591. But would not the same difficulty arise with the neutral ship? The neutral ship also, according to the hypothetical conditon, would pay a cargo due of some kind?—Quite so. If you can frame a law which would be accepted by foreign nations to tax neutral shipping, it would put British shipping and neutral

Mr F. L. Harris.

19 Feb. 1907.

shipping exactly in the same box. That is to say, it would not affect the transfer of British shipping to neutrals. I think you would prevent that. But that is only one half of my argument. That would be all right. It is true you might not get a transfer of British shipping to neutrals if you were able to tax the neutral up to the level to which the British shipowner was going to be taxed, but still it would affect your manufactures, and it would affect the question of employment in this country.

592. To the extent, that is, of the amount of the cargo due, whatever it might be?—No, more than that, because a very small increase might make all the difference. It might be only a farthing a yard; there might be only a very small addition to the cost of your raw material, and that might make the whole difference of your trade disappearing.

593. Yes, I feel that is so, of course?—Take steel rails; take a difference of price of a shilling a ton in these rails, which in raw materials means a mere fraction. The difference in price of a shilling a ton in steel rails may make all the difference, and probably would decide whether the order came to this country or went to one of our competitors abroad; and a comparatively small rise in raw material—25 per cent. in the case of cotton we will say—might make all the difference whether we had the trade or our competitors had the trade. A very small amount of war insurance means a considerable rise in raw material, as in the case I gave of the iron ore, where the insurance rate is only 5 per cent., and yet it doubles the price of your iron ore in this country.

594. As between these various schemes there is first of all the scheme of indemnity without payment?—Yes.

595. I take it we are all agreed that if the country would accept that, that is the best possible means?—Yes.

596. I am sure that is your view?—Yes.

597. There is the alternative scheme of purchased indemnity?—Yes.

598-9. And that, at present, is the only alternative scheme before the Committee. Supposing the House of Commons refused to have anything to do with the idea of a purchased indemnity, free gratis and for nothing, for certain reasons which Sir George Murray has already touched upon, I take it that as between that scheme and the scheme of insurance you would prefer something that would put the same penalties upon the neutral?—Yes, most certainly, if it could be done.

600. (*Sir George Murray.*) That could only be done, of course, in British ports?—It could only be done in British ports.

601. So that as far as shipping between neutral ports is concerned, the neutral shipowner would still have an advantage?—He would still have an advantage, yes.

602. (*Sir James Mackay.*) I take it that in your opinion if all the British shipping was transferred to neutral flags in time of war, we would probably have freights kept very much where they were before war broke out?—Yes.

603. That would probably be the cheapest thing for the manufacturers in this country?—You mean there would be no diminution in tonnage, and the freights would not be largely raised? Of course, the mere fact of war might raise freights to some extent.

604. But, apart from that, for the British manufacturer alone it would probably be the cheapest thing that could be done?—I think it might be.

605. Iron ore, of course, coming in a neutral ship from Bilbao to Cardiff or any of the smelting ports, might be contraband of war, and probably would be?—Everything nowadays seems to be contraband of war. It might be conditionally contraband if it was going to be made into guns.

606. Then it would not be protected in a neutral ship?—Not if it was contraband. But I do not agree with you that all the iron ore brought to this country could be made contraband of war. After all, the amount of iron ore that comes to this country for the purpose of making guns would be very small.

607. There was no transfer from the Japanese flag to a neutral flag in the time of the war between Russia and Japan, was there?—No, I do not think there was.

608. There was a good deal of purchase by Japan of British ships?—Yes.

609. And there was no transfer as far as I know?—No, I do not think there was any transfer at all. I did not hear of any.

610. (*Mr. Beauchamp.*) Do you anticipate there would be much difficulty in raising money for the purchase of British ships in time of war?—Purchase by neutrals, do you mean?

611. Purchase by the neutrals?—No, I do not think so at all. I think German and other foreign shipowners could get as much money as they wanted, if they could see a large profit.

612. There would be a good deal of difficulty, would there not, in obtaining crews for British vessels during the time of war?—Yes, I think there might be. British vessels subject to capture would have to pay much higher wages, no doubt, for crews, because the crews would be subject to capture The crew would use that as a strong argument for an increase of wages.

613. And, in fact, they might refuse to serve on a British ship?—Yes, I think they might.

614. And no insurance or indemnity scheme would get over that difficulty?—No, that is all an extra cost that the British shipowner would have to bear in time of war.

615. There was one point which I should like to ask your opinion about. Of course, the idea is to keep down the price of raw material?—Yes.

616. Then you say that the British ship would be kept out of the carrying trade and the neutral would come in until a certain point was arrived at, governed by the cost of the insurance?—Yes.

617. But would not that also have this effect, that the cost of the carriage, whether to this country or to Spain—we will take Barcelona for instance—would be equal, and therefore the neutral in Spain would have to pay the same for his cotton as the Englishman in Lancashire?—He has not to pay the insurance on the cotton itself in Spain for one thing.

618. No, I am talking about the cost of the freight?—I see what you mean. The point is this: the neutral would ask the Spanish merchant a correspondingly high freight?

619. Yes?—I think he would.

620. The man would not send his ship to Barcelona for a less freight than he could get to Lancashire?—He might for a little less.

621. But very little. It would not really alter the price?—No.

622. Therefore the neutral in Spain would really be paying the same price?—For freight, yes. Of course the British manufacturer would have to pay the insurance on his cargo coming to this country, which the Spaniard would escape if the destination were in Spain. On the other hand, the price of raw material in America in the case of cotton goods would not be raised, so we should still have to meet the competition of the American manufacturer.

623. Quite so. But what I want to get at is that the freight to Lancashire would be the same as the freight to Barcelona?—I should think probably the neutral would ask almost as high a freight. If he could get a freight to Lancashire for £2,000 he would not go to Barcelona for £1,000.

624. (*Sir George Murray.*) In fact, the war risks in one country would raise freights all over the world?—Yes, I think so.

625. (*Mr. Beauchamp.*) Then you mentioned the case of 20 voyages across the Atlantic. Do you not think you would substitute some other number, because 20 voyages across the Atlantic in one year seems a great number?—Yes, we might say 10 or 12. Might I ask how many voyages does the "Campania" make in a year?

626. (*Mr. Jackson.*) About one a month. But you said 10 voyages there and back?—Yes.

627. (*Mr. Beauchamp.*) But you were thinking of a tramp steamer?—In that case I was thinking of a liner, when I said 20 voyages a year, that is 10 voyages out and 10 voyages home.

628. With regard to the questions of insurance or indemnity, we have had some suggestion made to us that to get over the difficulty of what might be con-

sidered to be a large premium, it might be separated up into what I might call compartments: that you might have a premium fixed from the Channel to Gibraltar, another premium from Gibraltar to Suez, and a further premium from Suez to Australia or India, and that it would be within the option of the shipper or shipowner to take up any one or all of those different sections; that he could insure, if he thought it wise, from the Channel to Gibraltar, and then not insure in the Mediterranean, and then take it up again, we will say, at Suez, or something of that kind?—The State insurance, you mean?

629. The State insurance. Do you think as a practical insurance man that would be practicable?—I should think it would be absolutely unworkable. For instance, let me take a precedent: I disapprove of taking precedents as a rule, but let me take one. In the war with France, at the end of the 18th century, the insurance rate to the East, from this country was less than from Ireland to this country. The rate from Great Britain to Holland was 20 per cent. at one time, and the insurance rate to the East, I think, never went beyond 7 per cent. It would depend upon the concentration of the forces at the seat of hostilities, and so on. I do not think you could work any scheme like that, on those grounds alone; it would be impracticable.

630. We have had within the last 24 hours the report of the Naval Manœuvres?—Yes, I saw it in "The Times."

631. And when the insurance world realise that 55 per cent. I think it is of the vessels in the area, or of those that entered into the scheme, were captured, do you not think that will tend to put up the first insurance premium in the event of our going to war?—Certainly it will.

632. The premium in the first instance?—Certainly. The mere report that is published in the paper to-day probably will have its effect upon insurance premiums in the next war.

633. And as those captures occurred between the Channel and Gibraltar, you think the premium, which was put, I think, by several of the witnesses as a rate of about 5 per cent., would be enormously increased?—Enormously. In reading the condensed form of that report in "The Times" this morning, I think it concluded by saying that in all probability if it had gone on for another week the danger would be removed, or largely removed; the vessels would have been destroyed or put out of action. I have always rather taken the opinion—I may be entirely wrong—that if we were at war with a great Power we should find that all the regulations about privateering are not worth anything. Take an imaginary case—that we were at war, say, with Germany. Germany would purchase, we will say in Buenos Ayres, or in Valparaiso, or in any part of the world, any fast steamers they could get. They only want one antiquated gun that will throw a three-inch shell 250 yards. That is all that is needed, and that vessel for the purpose of destroying commerce is just as effective as the best battleship. You put a crew on board, she is put into commission, she flies the ensign of the country that is at war with us, and she goes out on the high seas. The Admiralty, I know, always say she will be there a very short time since she will be captured at once. But put her on any of our great trade routes, say, in the South Atlantic. Supposing you close the Suez Canal, you will have a British merchant vessel each hour or two going round the Cape. The mere fact of a vessel having to pass that route, and not being heard of for some time, would put up the rate of insurance to a very high figure on all vessels supposed to be in the neighbourhood, and would even affect the insurance on vessels about to leave China, Australia or India, or vessels known to be at sea; the rate of war insurance on every one of those vessels would probably go up to a very high price. That shows you what an enormous amount of mischief could be done by perhaps an old-fashioned fast tramp steamer, with one out-of-date gun; and of course I presume the object of any belligerent that we were at war with would be to damage our trade as much as possible and to produce those scares.

634. (*Sir George Murray.*) Her powers of doing mischief would be considerably limited, would they not? What would she do with the ships when she caught them?—Take the crew off, and sink them.

635. Of course Russia did?—Yes.

Mr. F. L. Harris.

19 Feb. 1907.

636. (*Mr. Beauchamp.*) Supposing the Government or the House of Commons agreed there should be no insurance or indemnity of any kind provided by the country, do you think that the insurance market for war risks is sufficiently large to cover the risk?—No, not in the beginning of a war. There is some very interesting evidence that I remember, though I cannot quote from it, which I think, if I might suggest it to the Committee, it might be worth while to see, because the probability is it is not known. It is the evidence given by Mr. Julius Angerstein on a Committee that sat, I think, in 1821 on marine insurance, just after the wars. At the beginning of the war the market was a very small market; there was not sufficient scope in it to absorb war insurance, but by the end of the war the underwriters at Lloyd's were taking lines running up to £10,000 a name, and the profit that was made was very large. I only mentioned that because it has been said that underwriters during the Japanese war were working at a loss; they lost money on the balance probably. But in the French wars, according to Mr. Angerstein, large fortunes were made. He was one of the biggest brokers and underwriters at Lloyd's at the time, and he produced figures from his own books showing the enormous business his own firm had done, and I think he mentioned there were only one or two failures in consequence of war risks at Lloyd's at that time. The underwriters were very nervous at the commencement of the war, but ultimately the whole of Lloyd's were accepting war risks and getting enormous premiums and making large profits. In a marine war the war risk market is a very nervous market to start with. I think if there were war tomorrow the war risk market would not absorb a 50th part of the business to be done, but presently it would gain confidence.

637. But in the meantime commerce would be almost entirely stopped in this country?—Yes. In the American Civil War war risk was impossible to cover. It began with a premium of 20 guineas per cent., and after a few captures by the "Alabama" it was impossible to place business at any price, and the result was that practically the whole of the American tonnage was transferred to this country. I have the figures. I do not suppose the Commission would care to have them, but I have the figures. Two-thirds of the United States tonnage was transferred to Great Britain, largely because war risk was uninsurable.

638. And yet the captures were comparatively few?—Yes, the captures were comparatively few, but war risk was uninsurable.

638*. (*Sir Thomas Glen-Coats.*) You pointed out the effect on the export trade of this country if we had not an indemnity, in consequence of the increased cost of raw materials coming to this country and the increased cost of goods shipped abroad?—Quite so.

639. Do you think that that would only continue during the war; or would the fact be that, supposing our competitors, we will say Spain or Germany or other countries, had established their goods in place of ours, it would be very difficult for this country to get that back afterwards?—I think when a country has lost a trade it is very difficult to get it back again. All history points to that.

640. (*Mr. Jackson.*) You mentioned that in principle you would be rather in favour of an indemnity free of charge than insurance?—Yes.

641. You were discussing with Captain Ottley the question of a ship going with cotton to Barcelona compared with the ship going to Liverpool?—Yes.

642. And I think the general conclusion you arrived at was, was not it, that on the whole there would be very little difference of freight between the two?—Yes, provided our tonnage had all been transferred to neutrals.

643. The only point I would ask you on that is this: Do not you suppose, both in that connection and also in connection with the other evidence you gave us with regard to war risk premiums, that neutral shipping would also have to pay some percentage for war risk?—I do not think it would have to pay very much.

644. But there would be something, would there not?—It would be nominal. I mean provided the neutral shipping could warrant that they were not carrying contraband of war the risk might be half-a-crown per cent. per voyage, or something like that.

Mr. F. L. Harris.

19 Feb. 1907.

645. Supposing you even now in times of peace want to include war risk in your insurance, have you not to pay for it?—Yes, 3s. 4d. or 5s. per annum.

646. I think on some routes it is higher, but what I mean is in time of war that would rise appreciably?—Yes.

647. Even with neutral shipping going between neutral ports?—Yes.

648-9. I only want to point out that if you gave an indemnity free of charge to the British shipping you would give a distinct advantage, to the extent of that premium on neutral vessels, to the British shipping, would you not?—If a neutral vessel is not carrying contraband of war, I should think probably in nine cases out of 10 she would not insure against war risks, but if it was understood she was not carrying contraband of war the war risk would not be very large.

650. But it would make that difference?—You would be giving a bounty to that extent.

651. And to that extent I suppose you would be quite prepared to see the British shipping pay?—Yes, I only want equality; that is all.

652. Another statement you made was as to the difficulty of valuing ships?—Yes.

653. You pointed out that if there were two sister ships, one which had been employed in a profitable trade and the other which had been employed in an unprofitable one, and the owners of the ship which had been employed in the profitable trade were enabled to write her down to £20,000 and the other maintained her original cost of £40,000, there would be a considerable difficulty with regard to the indemnity. The ordinary marine insurance on those vessels would still go on?— Yes.

654. And surely the marine insurance underwriters, either Lloyd's or the companies, would be able to settle what value they would take for that ship?—You see marine insurance values are very curious things. It is a matter of arrangement between an underwriter and an owner, and it is an arrangement that is fixed very largely by the rate of premium. For instance, if I go to Mr. Beauchamp and show him an insurance on a vessel, he may say: "I think that value is far too low; make the value higher and I will insure it." It means that there is more premium paid, because there is a larger value insured. The value for which a vessel is insured for marine risks is no indication of the vessel's real value. Very often it is 50 per cent. higher; sometimes it is much lower.

655. The amount it is insured for?—The amount it is insured for. The shipowner, for instance, sometimes looks at it and says: "What would I have to pay to replace this vessel?" At other times he says: "What have I got this vessel written down at in my books? What is the least I can insure it for?" As a rule the shipowner tries to make his value as low as possible; he wants to pay as little premium as possible, and the underwriter tries to make the value as high as possible. Of course, there is a sort of idea amongst some people that it is the shipowner who wants to insure his vessel for a very large sum, and that the underwriter wants to keep the value down. As a matter of fact it is exactly the reverse.

656. Then you do not think experience and practice in marine insurance would be any guide for insurance purposes of indemnity?—No, but I think there would be no difficulty in getting expert opinion, from people whose business it is to sell or value steamers, which would be within 10 per cent. of the value of the steamer. I think there would be no difficulty in getting the value.

657. Then with regard to dangerous areas you indicated that you would exclude the indemnity for vessels going through a certain defined dangerous area?—Yes.

658. Would you exclude the indemnity of the cargo also of such vessels?—I think so, certainly.

659. Of course, the owner of the cargo has no voice in the matter. You make the insurance of the cargo dependent on the action of the owner or captain of the ship?—The Government restriction would have to come in force before the cargo was shipped. Any cargo that was shipped to a destination, or where the vessel which was carrying it had sailed, would have to be allowed to proceed. I do not think you could say: "After to-day no indemnity will be paid on any vessel entering such a port." I think you would have to say: "After this day week, or after to-morrow, the indemnity will not extend to a vessel sailing to such a port." You could not possibly interfere with a vessel at sea. All arrangements would have been made, and that would be absolutely impossible

660. Therefore you would limit it to some future time?—It would have to be a regulation coming into force applied to vessels which had not sailed.

661. (*Mr. Beauchamp.*) May I ask one more question on this valuation point? There would be no difficulty, you say, in getting at the value of the steamer for the purpose of indemnity?—I think you would get what the vessel was worth in the market at any time easily.

662. The only difficulty, it seems to me, is this, that in time of war the values of vessels alter very considerably during the progress of that war?—Quite so.

663. You know, of course, during the Japanese war there were sales made at varying prices and at rising prices?—Yes.

664. Do you think there would be any difficulty in fixing the price of a vessel on a particular day?—No, I do not think there would. If you went to a valuer to-day and said: "Here is a steamer, what do you estimate her value was on the 31st December?" he could probably tell you within £1,000 what the value of that vessel was.

665. Then if a man's vessel were captured, we will say, on the 31st March, he might be entitled to indemnity for a certain sum, but if his vessel were not captured until the 30th April he would get a higher or a lower valuation. Do you think there would be any difficulty in arriving at a fair valuation under those circumstances?—I think your valuation ought to be taken as the valuation at the commencement of the war. I do not think a shipowner ought to have any benefit from a rise in the value of his vessel due to war. Those details are difficult. The question of value to my mind is a difficult question. Of course, value would have to be fixed before the vessel sailed. That is quite clear; before the indemnity comes into force the value must be fixed both on the vessel and the cargo. A man must know what he is going to get. Take a vessel that is heavily mortgaged, say a vessel that is worth £40,000 and she is mortgaged for £30,000. The mortgagees will not let that vessel sail until they know what the Government has got to pay. It will not do to leave that till afterwards.

666. Then the valuation will be fixed between the Government and the shipowner before the vessel sails?—Yes, I think it will have to be before the vessel sails.

667. (*Sir George Murray.*) That will be a very serious practical difficulty, will it not?—I do not think it is any more difficult before the vessel sails than after she sails. There would have to be some sort of office where all that business is negotiated. You would have to have an expert at the office to say the Government is prepared to give you such and such an indemnity.

668. (*Mr. Jackson.*) It would employ a very large staff?—You would have to have a large staff anyhow. After all, there is not such a tremendous lot of vessels sailing every day. You would have to have an office in London, another in Liverpool, another one in Newcastle, perhaps, and so on.

669. (*Sir George Murray.*) And the office would have to quote the value there and then?—I think it would have to fix a value.

670. There and then?—No, I do not say it would have to be fixed there and then, because in these cases it would probably be a matter of a week or two's arrangement. At the first start off it might have to be settled at once. But a man knows probably a month before where his vessel is going to. It might be done in this way—it is only a suggestion: An application form goes in, "My vessel is going to sail at the end of next month; I want an indemnity for her." A reply comes back a week afterwards, "The State will give you an indemnity to such and such an extent."

671. Then that amount of delay you think would not be too great, and would not hinder business?—Not in nine cases out of ten.

672. (*Mr. Beauchamp.*) How would that affect vessels which were at sea at the time of the commencement of war, because the idea was that they should automatically come in for an indemnity supposing there was a scheme for indemnity on non-payment?—Of

course that is a difficulty. I do not want in any way to make it appear that I think this question of value is an easy thing. I think the question of value is difficult. I think it wants very careful thinking out.

673. (*Sir George Murray.*) What objection do you see to leaving it to be settled afterwards by a Board or Court of some kind of valuers?—The difficulty would be the difficulty, for instance, of a vessel where there are heavy mortgages or loans on her.

674. That would not affect her value, would it?—No, but the mortgagee might say, "I am not going to allow that vessel to sail. I am not secure, and I do not know what I am going to get if she is lost." At present he keeps an insurance policy in his safe.

675. He would have to trust to the Board?—He would have to trust to the Board that he is going to get the vessel's value.

676. Do you think he would not be prepared to do that?—He might.

677. If the ordinary owner would, why should not the mortgagee?—The mortgagee is rather different. A mortgagee simply lends money; he is not taking really a trade risk. He is lending money on the value of the vessel. If he thinks that that vessel might be lost or captured in consequence of war, he might say, "Well, I should prefer she does not sail until I know what value is going to be placed on her, to know I am right for my money if she is captured."

678. What he would have to do would be to insure the difference between the indemnity and what more he wanted?—But then he would not know what he was going to get by way of indemnity.

679. (*Mr. Beauchamp.*) There is always a large margin between the value and the amount advanced?—As a rule, but sometimes it is the wrong way. I have known cases where it has been the wrong way. Not often, but it is so sometimes.

680. (*Sir George Murray.*) Have you thought at all what the effect of free indemnity would be on the course of business, to take, for example, cargoes consigned to order in British ports, which I will suppose are not now the property of a British subject, but might be the property of foreigners? Would the tendency of an indemnity be to insure those goods being transferred before they sailed?—I think it would. If it was going to British ports I think it might. There would be a tendency to make them British goods.

681. (*Mr. Jackson.*) Would you not insure all cargo in British bottoms not contraband?—Yes.

682. That would cover your difficulty?—I think you would have to.

683. (*Sir George Murray.*) Whether they were the property of foreigners or not?—I think you could not help it. It would be so easy to transfer cargo to a British name. Probably foreigners would not ship by British vessels if you did not insure them.

684. If you did not indemnify them?—If you did not indemnify them you would have no foreign-owned cargo, for merchants would ship entirely in the names of British subjects.

685. Do you think the Government as a matter of policy ought to indemnify the foreign owner of the cargo in British bottoms?—No, as a matter of policy they should not, but you would find that there would be no foreign owners.

686. That the cargoes would all be sold before shipment or on shipment?—The cargo would all be consigned to British firms or shipped in the names of British firms. It would be a British cargo.

687. (*Mr. Jackson.*) You would do away with all consignments in that case?—Yes.

688. Just take the enormous amount of stuff, wheat or sugar, for instance, which is consigned to a certain point for orders. That might be sold in the meantime to an English, French, or German subject?—Yes. It is becoming much less common than it used to be to send to a port for orders.

689. It is done to an enormous extent, for instance, in sugar, and in wheat, and so on?—Yes.

690. It is very difficult to fix the ownership of that cargo?—What you would find would be that if you put any restriction, if you said that goods in a foreign name on board a British vessel were at a disadvantage as compared with goods in a British name on a British vessel, you would find that all the goods went automatically into a British name. I think for political purposes there would probably have to be restrictions. That is to say, the House of Commons would say, "Why are we going to indemnify foreigners; we will exclude foreigners," but you would find when the actual event occurred there would be no foreigners.

691. (*Sir George Murray.*) Have you anything further to say to complete your evidence?—There is one other point I should like to bring before the Committee, because I think it was brought out in Mr. Bowles' evidence. It was on a question of the effect of war risk insurance on prices during the great French war. He quoted from Tooke's "History of Prices." He argues that the effect of war from the end of the 17th to the end of the 18th century was that prices of corn in this country were lower during the time of war than they were in times of peace. Of course, we in those days grew the whole of our corn supply, and we exported corn largely. I have looked through the history of those wars. I have looked through the Acts of Parliament affecting that period, and you will find that during the wars very often either corn could not be exported or a prohibition was put on the export of corn during the war. The result was that you had a surplus of corn retained in this country, and the price consequently fell. I do not think that can be taken as any argument that war risk insurance does not put up the price of corn or other commodity. What occurred is exactly what one would expect to occur. We could not export corn, or we had to pay an extra insurance on the corn exported, with the result that there was a bigger surplus of corn left in this country, and prices consequently tended to fall.

692. We were, in fact, an exporting country at the time?—We were an exporting country practically during the whole of the eighteenth century. In fact, we were exporting corn up to 1808. In 1792 we exported 277,000 quarters.

693. Is there anything further you would like to add?—No, that is all.

FIFTH DAY.

Tuesday, 26th February 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Mr. H. LLEWELLYN SMITH, C.B.
Captain C. L. OTTLEY, R.N., M.V.O.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.

Mr. GEORGE H. DUCKWORTH (*Secretary*).

Sir THEODORE ANGIER, called and examined.

Sir T. Angier.

26 Feb. 1907.

Sir Theodore Angier, in a preliminary memorandum,* had submitted:—

(1) That the State is charged with the duty of maintaining and protecting the Empire, and that the predominence of our Naval and mercantile marine is essential thereto.

(2) That the Mercantile Marine would be the most vulnerable point of attack in a naval war against Great Britain, and that no Navy would be sufficient to render it secure on the chief trade routes.

(3) That in the absence of an effective indemnity against capture, seizure, etc., the effect of a declaration of war would be to force shipowners to lay up their ships, or to transfer them to a neutral flag.

(4) That the effects of such transfers during the American Civil war and the Franco-German war were seen to be disastrous.

(5) That in 1904 it was proved by exhaustive calculations made by a committee of the managers of the Steamship Mutual Indemnity and Protecting Clubs of London, and a joint committee of managers and directors of steamship companies, that it was impossible for an indemnity to be provided by individual effort.

(6) That the basis of State indemnity should be the payment of a nominal premium during peace time, and that the risks to be covered should be those under Lloyd's "Capture and Seizure" clause.

(7) That the value of each steamer or ship might be fixed at the cost price paid to the builder, less 5 per cent. per annum depreciation on the reduced value; or the value of hull and engines declared in the ship's all-risks policy for the year previous to that when hostilities break out; or the value declared by the owner on which he pays his annual war premium during peace time.

(8) That all ships on the British register should be covered compulsorily.

(9) That it is less important to allow an indemnity to cargoes, and that it would be impossible to exact a premium from cargo-owners in time of peace.

694. (*Chairman.*) I think you are a shipowner?—Yes.

695. You have given some attention to this question of an indemnity or guarantee for our shipping in time of war?—Yes, I have served on a Committee which was appointed, consisting of the managers of those great Mutual Indemnity Associations that we have, and members of their Boards, to thresh the whole question out as to how it could be compassed by private mutual guarantee, the same as we do against the other risks.

696. Generally speaking, I believe you are in favour of some scheme of State guarantee?—Distinctly so.

697. On what ground would you put it; on the ground of the importance of the Mercantile Marine or on the ground of the importance of the cargoes carried by the Mercantile Marine?—Entirely on these two grounds, first of all, that in no other way can a real indemnity be obtained; and, secondly, because the Mercantile Marine is of the first and most vital importance to the maintenance of the Empire.

698. I gather that, in your opinion, no purely naval protection would be sufficient to guarantee the Mercantile Marine in time of war?—No, I quite see that that is an impossibility, because it is practically the covering of the whole surface of the oceans and seas, and that could never be done.

699. What then, in your opinion, would be the result of the outbreak of war; a great rise in freights, or the withdrawal of the Mercantile Marine?—A rise in freights would certainly ensue, and the extent of the rise would depend mainly on the position of our ships. With a guarantee, of course, the rise would be immensely less than without a guarantee. As an owner myself I find from old experience that each one has taken this view of it, that he must get rid of his property; it would be absolutely useless, it would run such enormous risk of capture, and to cover that risk of capture such an immense premium would have to be paid that it would be better to get out of it. Naturally one would sell, as we saw was done in the Franco-German war, where the owners adopted a sort of sale or transference, sometimes temporary sale or transference to a neutral flag.

700. In the Franco-German war?—Yes.

701. The Germans transferred shipping to neutral flags, do you mean?—Yes. I had several cases of old clients of my father's. I was just beginning business then, and I can remember my father having orders to effect these transfers and sales. Money passed, cheques were exchanged, so that it meant a sale, but the idea was that they would be re-transferred afterwards.

702. May I ask whether they were retransferred?—No, in most cases they were glad to get rid of them. In some cases law suits ensued.

703. And, of course, our shipping is of greater importance to us than either the American or the German shipping to those nations?—Exactly so. I look upon our shipping as the ground work and basis of the Empire.

704. You have already referred to the conference between mutual indemnity and protecting clubs, which was held a year or two ago, I think?—Yes, in 1904.

705. What were the results of the Committee's investigations?—We first of all went on figures.

706. Perhaps I should ask you in the first place to tell the Committee what was the basis upon which you considered the proposal?—The basis was this. Of course the 1904 Conference was not the first Conference, or rather it was the first Conference but not the first sort of *pourparler* that we had had. It is a question that we have been trying to thresh out for a great many

* *Vide* note, p. iii.

years, but this was the culminating settlement as it were of the question. We got, as we thought, the best men possible, the indemnity and protecting associations, who practically include nearly the whole of the British tonnage one way or the other, and we naturally said these are the men to put together with a few of their Committees to thresh the whole thing out. From the beginning we always approached the question with how much would it cost us privately. We knew it had to be paid for as a value, and it was always on the basis of as low a rate of premium as we could work it out correctly during peace time, mainly to avoid that rush and flurry that war brings with it.

707. Did your scheme contemplate a higher premium in war?—We put it both ways. We tried first to see if we could find out a peace premium, such a premium that when war came there would be a fund to pay losses out of. Then we found that came into a very big figure, and of course we were hampered by a limited capital, because even taking up the whole of what we could compass in our clubs, altogether something like £100,000,000, it came to too heavy a premium. Then we thought the best way would be to have the eace premium as low as possible, supplemented by an increased rate as soon as war broke out. But on all the points, when we came to look into it, we always came to grief on the question of the capital indemnity. On the small premiums that we worked out in peace time consistent with the stamp duty—we had that to face always—it really came to absolutely too little; there was no real indemnity in it. There were several legal questions too, which came in when it was only a private and mutual system, the question of forcing your members say, even to carry on year by year, and the other question of forcing them under a contract to take out the policy at the increased premium when war broke out. We had no power in fact over our members, and it would always involve practically a legal difficulty in the end. You would always find some members who would consider their pockets first to see if they had not a loophole to to get out of paying this extra premium if it suited them.

708. That is to say, if a war broke out among the far Eastern Powers you felt there would be great difficulty in getting traders whose lines went to the West to take out a war policy at all?—Yes; they would always think, "My pockets are not touched; I am not going to pay."

709. But the real difficulty in both cases was to accumulate, as I understand, a sufficient sum to offer a real indemnity?—Quite so. First of all, the capital was always too small; and then the means of collecting the mutual contributions was impracticable.

710. By saying that capital was too small you mean the proportion of British shipping included within your Associations was not large?—In the clubs, yes.

711. Then you mentioned a difficulty in regard to the stamp duties. That arises, I think, from the fact that they are *ad valorem* duties?—Yes, that is it.

712. And that a policy which contemplated an increased premium in time of war is liable to the higher stamp duty even in time of peace?—Quite so. We wanted to get out with a penny stamp and for that penny stamp you can only have a half-crown premium.

713. I think it has been held by the courts that an actual half crown with the possibility of a further call, has to be stamped at the higher rate?—Yes. At any rate, it is open to that construction.

714. Your Committee, of course, worked upon the assumption that the insurance was to be a mutual insurance provided by a fund levied on shipping in one form or another?—In mutual insurance a fund is not levied. When a loss occurs it is distributed *pro rata* on the capital. You do not contemplate accumulating a fund when you are mutual; there is no necessity for it, but as the loss occurs you distribute the loss.

715. (*Sir George Murray.*) You make a call?—Yes.

716. (*Chairman.*) It contemplated that the loss should be borne by shipping?—Yes.

717. But you found it impracticable to work out a scheme of that kind by private endeavour?—Yes.

718. If there is a national scheme, would you propose that in some form or another the loss should fall upon the shipping trade?—To the extent of a premium paid, that is to say, the question is to arrive at the reasonable premium to be levied in order to approximately cover the losses

719. What are the risks that you would want the State to insure against?—Simply Lloyd's free from capture and seizure clause, the only clause in question.

720. And the risks under that clause are clearly understood in the insurance world, are they?—Yes, it is a very comprehensive clause.

721. Assuming that you had such a scheme at work, how would you arrive at the value of a ship which was lost?—There are one or two ways. The rough-and-ready way would be to take the value the owner declares when he takes out his policy. The question of altering that value would be a matter for consideration. In our ordinary policies we do change values. It is always the subject of mutual agreement.

722. I am afraid I do not quite follow what you mean by changing a value in an ordinary policy?—Reducing or increasing.

723. During the currency of the policy?—No, you cannot do it during the currency of the policy.

724. But in taking out a fresh policy on the same ship cases occur in which you increase the value of the ship instead of depreciating it?—They are rather rare. The general tendency is to reduce year by year. But you could take that value, and that is settled; in taking a Government policy it is the same as taking it with the underwriter. He would ask what value you would declare, and of course you would pay on that value.

725. Is there not a great difference between a Government scheme of this kind and an ordinary mercantile insurance? I put it to you that in the ordinary mercantile insurance it does not matter to the underwriter if the ship is over-valued, because after all his premiums are calculated at such a price as covers the risk whatever it is or whatever experience has shown it to be?—That is perfectly right.

726. And if values are generally higher than the value of the ships, so will premiums be, and the underwriter gets home?—Yes; he reckons his calculations to cover it.

727. Do you anticipate that in any State scheme a premium can be taken which would cover the full amount of the risk?—I do not think you can work that out. You would always be faced with this, that it all depends upon the length of peace from the time of commencing your insurance to the time that war breaks out. If, for instance, the peace endures for 25 years, a very small annual premium will put the Government in command of an enormous sum. Suppose war broke out a year after your scheme was commenced, then, of course, the country pays up. It really resolves itself into a risk taken by the State, simply because this particular trade is the trade without which the Empire cannot go on.

728. But then it becomes more important to the State to see that it pays actual losses and not fancy prices?—Quite so. After all, like all underwriting, it is a bet. The Government would back peace, I suppose, and the owner would back war, and then you have to get at the price.

729. Do you contemplate that your scheme would be compulsory upon shipowners?—I think no scheme can answer unless it is accepted all round.

730. As soon as a ship begins its first voyage it must be compulsorily insured with the nation?—Yes. You see the Government charges us so much for actual registration You will remember Government gave us a small sop in light dues for carrying boys, and they took it away by making us pay a heavy registration fee, which we never paid before. We bore it calmly, as ship-owners generally bear everything; but that was one case where we did not grumble, and you are charging this registration fee still. It is rather a heavy one. It would matter really but little if the whole of the trade were under the same rule, paying the small premium at the same time; I do not think they would feel it. They will always grumble at first, no doubt, but I look upon it in this way that if we are frank we must confess that up to now we have never dreamed of getting at anything otherwise than by paying. It was the same with our Federation, we had to pay. With our own indemnity and protecting clubs we pay, and when you look at the amounts we pay for those indemnities, a reasonable amount to cover this risk on the basis of a fairly-extended peace would not be appreciable, I think. I think the owners would easily carry on their business without additional trouble and without much complaint. It would be money paid for value received, and on that basis it is just.

Sir T. Angier.

26 Feb. 1907.

731. Let me ask you one further question about the risks. You speak of the risks covered by the ordinary clause. Of course, if you had a State guarantee of the kind we are contemplating it must be dependent upon the master of any given ship following such general instructions as might be given by the Naval or other Authorities. Suppose that involved detention of the ship, would that be covered by the ordinary clause, detention, that is, by the Authorities of our own country, not by the King's enemies?—Quite so. I think it would be only fair on both sides that it should be a clear stipulation that in the event of a shipowner suffering detention and loss by complying with the orders of Government, his assurers, he should be paid, his action being for the general good.

732. It is not the case at present under the policy to which you refer, is it?—No, it is not, excepting detention by the enemies.

733. And it would introduce a very large and a very uncertain risk, would it not?—I do not think it would

734. Is there not much more dispute arising on ordinary insurance policies about damage through detention, or loss of market through detention, than there ever is about loss by marine risks?—No, those cases are comparatively rare. I will give you one instance how it worked in the Russo-Japanese war. For instance, in the case of those ships that we had with our coal on board under our contracts, when they got out to the last neutral port the underwriters saw it was a certain capture. They then approached the shipowners, and they went so far as to offer to pay them a total loss of the ship if they would stop where they were, and they would pay all demurrage and detention. They were either to stop as long as the underwriters liked, or to abandon the whole voyage and come home, at the underwriter's option. The price they offered the shipowner for that was a very handsome rate per day for waiting, or, they said, "If we close now right off, we will give you the value of your ship." Thereby you see they saved the loss of the cargo, and they were that to the good, whereas they knew if they went on, the ship would be a total loss, and the cargo as well.

735. (*Sir James Mackay.*) And I suppose the underwriters would have the ship?—The underwriters would have the ship. I think they offered the owner even the ship at last. Of course, they gained the value of the cargo always, and that was a very big sum. But that was a case of their being in extremes. There was a certain total loss if the ships went on, and so they said, If we save the value of the cargo we are so much to the good.

736. (*Chairman.*) Going to the premium again, your idea is that we should fix a peace premium, and that we should maintain the same premium in war? Perhaps I should put the question differently: you think that a moderate peace premium, if the establishment of the system were fortunately followed by some years of peace, would be sufficient to provide a guarantee fund without raising the levy in time of war?—Yes, if the peace were long enough. But I should think that as it is, to make it a little less uncertain, there should be a provision for power to the Government to charge so much extra in war, a graduated addition of premium according to the period of peace that has passed before war comes. Then if you do that, I think you should also have a clause for surrender value, because you might go on for 25 or 30 years. In 30 years you would be getting a tremendous sum of money in hand, and in 30 years the lives of many of these ships that have paid you are finished. Your risk is over by the end of the life of the ship, and therefore I think it would only be reasonable to say that after a certain number of years there should be a surrender value of the policy. It is so in life assurance; you pay your premium year by year, and after a certain time if you are still alive you have got a surrender value. I do not like to introduce the idea of life assurance into the question, however, because there is really not much comparison, but the idea is that after the Government gets a continuous payment for a long number of years, there should be some surrender value. It seems only just, I think. We might go 50 years with continuous peace.

737. Supposing, instead of comparing it with life insurance you compare it with fire insurance, there is no surrender value there, is there?—No.

738. Is not that risk more comparable to such a one as we are thinking of?—No, I should not think so, because practically your house and your warehouse go on for 100 years or more, and it is the fire they are looking at. Their clauses, too, for indemnity are so different in fire insurance In fire insurance they do not take your policy value at all; they say, "We will make it good."

739. But that is an advantage that you have in insuring your ship over a person who insures a house. It is scarcely a reason for giving him another advantage?—I do not follow the advantage.

740. In the case of a ship you declare a value, and if she is a total loss you get that value without question or dispute?—Yes.

741. Whereas, I may have paid a premium on my house for years on a certain value, and then if the house is burnt down it is open to the insurance company to dispute the value. They have never disputed the premium, but having pocketed the premium for all those years' time, they dispute the value. That is an advantage which the marine insurer has, is it not?—I think it is an advantage. I think really, it would be an advantage to introduce it into the insurance of houses. It saves a lot of dispute. But I do not think you will ever find the same possibility coming in that I am instancing. Your premium is always much larger, and must be much larger, in the case of ships. You come into fire insurance, where you get premiums down to 6d. or 3d. per cent. No extent of years will ever bring you the total value on the one house; it is only on account of the immense area that they spread it over that the Insurance Companies can make it so small, and therefore that question would hardly come in with fire insurance.

742. In the course of your investigations on the Committee, to which you have referred, what calculations did you make as to the risks that you would have to run?—It is more or less a rule of thumb. We took first of all the maximum amount possible for individual subscriptions, by taking simply the sum we had got mutually insured, and then we saw, of course, the widest extent one could go to, and there was the collecting of the money, and there the trouble came in. It is in the collection of the mutual subscriptions. The amount of capital entered, considering the possibility of collection, did not come in sufficient to pay a reasonable estimate of losses.

743. But your estimate of losses was really guesswork?—Quite; it must be. I do not think you could ever get any proper data.

744. Do you remember what you put it at? Could it be expressed as a percentage of the shipping?—The percentage of shipping that we covered, you might put I suppose, at about 30 per cent. of the total.

745. Of the total shipping of the country?—Yes.

746. But in considering what your losses might be, did you put them at 5 per cent. or 10 per cent. of the total shipping you insured?—We looked more at how much we could collect, and that was where the hitc came in.

747. You really considered how much money yo could collect, and you came to the conclusion that it was insufficient to cover the possible losses?—Yes.

748. Or even probable losses?—Yes.

749. In the suggestions that you have made, do you contemplate special rates for different classes of ships, or would you have a common rate for every class o ship?—I would make it a common rate.

750. And the same thing with regard to voyages; you would not discriminate between voyage and voyage, but you would make it a common rate?—I do not think you can face such a discrimination, because you are starting in peace time, and it is a pure toss-up which Power is going to fight us; it is a pure toss-up which trade is going to be threatened immediately; and after that, you have got to come to the fact that it is almost certain a naval war will be a long affair, and it is quite certain then, if it is a long affair, that more or less every route will be threatened; and our ships cover every route. It is not like a small country that has most of its shipping in one trade. British shipping is in every trade and in every sea and every ocean, and it is no use one man saying "I shall not be hit first." No one knows when his interest will be threatened or which will be hit first. We are therefore all on a plane, and we say we will subscribe equally.

751. How do you contemplate claims being settled? What would be the tribunal to decide on a claim?—A very simple one, I should think. I think I have put

down first a member of the Treasury; he would want to have a look in, I suppose. But the main people you want are only the men who are conversant with the business. Take a couple of shipowners, a couple of underwriters and one average adjuster, and it will be quite sufficient. It all depends on the amount of work they will have to do. But they are simple questions.

752. And you think a Board of that kind would have no difficulty in fixing values fairly?—Not at all. Even the shipowner, if he knows his business, will always give you a very fair value.

753. I suppose it would tend to err on the side of generosity to himself, would it it not?—You would never give him such a chance. We have already, I thought, gone on the basis of having a fixed value arrived at in one or two or three ways. The value should always be a fixed value which cannot be disputed; it is in the document or else you would put your clause in. There are three or four ways I have put down. I think the simplest thing is that when a man registers he states his value, and at any rate for that year it is fixed.

754. One other way you suggested, I think, was taking the cost price of the ship and allowing depreciation at a fixed rate?—Yes. Even then it is a fair indemnity. It is an indemnity you want, and I would certainly make one provision, that there should not be a large element of bargaining in it. The idea is an indemnity, not a speculative insurance.

755. Of course, you attach great importance to the prompt settlement of claims?—That is an absolute necessity.

756. In cash?—In cash. At Lloyd's it does not take you 72 hours to settle a £100,000 claim.

757. But Government departments generally do not work so fast?—This would be a special Committee; I do not know how the Treasury would pay.

758. We have spoken hitherto entirely of ships. Would you apply the same principles to cargoes?—I do not know that my evidence is worth much as to that. It is purely a commercial man's opinion, the opinion of one who has studied the question from pretty well all sides; and, reasoning it out, I do not think there is any necessity to touch merchandise. I fail to see it.

759. You hold that if the ships are there and ready to sail, they would have no difficulty in getting cargoes?—I always find that wherever there are buyers for cargoes the cargoes get to them, and it is no point to this country how provisions come in, whether with British ships or with foreign ships; and in war time, if ours were protected of course they would do the most of the trade. But any way we should always get goods. We should have to pay for them, and the only point that I can see in raising the question of a Government indemnity on goods is this, whether the Government contemplates easing its people in the cost of their provisions. If they do that you need not trouble about insurance. When the goods come in after they have paid the underwriter's insurance, the Government might subscribe so much to the price. It seems a simpler way to me. It is a most intricate thing if you start on such an indemnity for goods. You could not possibly apply this peace premium to it. It is no good trying it. You could not estimate it so easily; and another thing is that produce would not stand it.

760. Would not stand the rate in peace time?—No; it would handicap the British in trading. The foreigner would not pay this and the Britisher would.

761. But your view is that on the ship it would be so small a matter that it would not handicap the British shipping?—No, I do not think it would. They are accustomed to pay these premiums. They pay in so many different ways, and this would only just be the one more. They are wanting this indemnity, and therefore they would pay for it. It is only buying what they want.

762. Did you have any experience of risks during the Russo-Japanese war that you could give the Committee?—Yes. We were in the business from beginning to end. There was a contract I had in partnership with a Russian friend to send out 50,000 tons of coal towards the end of the war. The only way we could get the ships was to give them a policy of insurance of a certain value. Roughly, it was the ship's market value of the day, and we had to pay for that policy 30 guineas per cent

763. That would be shipping coal to Vladivostock?—Yes, and right past the Japanese fleet.

764. For double contraband—contraband in itself, and going to a blockaded port?—Yes.

765. And the premium for that was 30 guineas per cent.?—Yes. Then the underwriters started bargaining with the owner practically against us. We wanted at all risks to the ships to go on, on the offchance of one or two getting in, but they came in then and bargained with the owner not to go on. So that they really deprived the Russian Government of the offchance of three or four more getting in by these tactics.

766. Were those the cases you were referring to earlier?—Yes, those are the very cases. That was done to a considerable extent in the early stages even. The underwriters played that game. They covered the whole thing, and then they tried to save themselves half the loss by bargaining with the owner.

767. Do you think the premium was more than proportionate to the risk? Was it at all a panic premium?—Yes, it was a fair illustration of what a war risk would be. It was quite a fair one, I think, especially in the Russian risks. Of course, there were two kinds of risk. One was the insuring of Japanese goods. They went at ridiculously small prices. They began about 5s. per cent., and I have got a list of the whole cost of them, and I do not think they ever went to more than 30s. or two guineas per cent., whereas the Russian risks went to thirty guineas.

768. But on the whole your experience would lead you to say that the underwriters did not do much more than cover themselves?—No, I do not think that they did. Of course it all depends upon the area they covered. If they started at the beginning and went on with the business right to the end, they made a handsome thing out of it, but it was those who came in at the last, for instance, when the Japanese fleet was released and free from Port Arthur, who were the sufferers.

769. The Russian Government did not give any kind of indemnity except on special cargoes to their order, did they?—In one or two cases they took the working of it themselves, and they took up through their agents their own ship, and paid into a bank the value of that ship, with instructions to the bank to pay it to the owner in case of the ship being captured.

770. But they gave no general guarantee for Russian merchants?—No, it was only in special cases. I suppose it was an experiment.

771. (*Sir George Murray.*) Does not your suggestion amount to a compulsory tax on every ship on the British Register in time of peace, in return for indemnity in time of war?—Yes, I would not call it a tax, because it is not a nice word. Shipowners jib at that, but they do not at an insurance premium. We have a tax now for the Federation against strikes, a tax against all those acts of the captain beyond our control, running down a valuable ship for instance, and making us liable for £200,000 or £300,000. We join together and insure those, and pay so much a year for it. Really it is no more than a necessary item of disbursement in managing and working your ship.

772. Then it would be compulsory on every ship on the British Register?—I would make it a condition of registering under the British flag, and there is an end of it.

773. That they pay an annual insurance premium to insure against war risks?—Yes, you want to keep your British Mercantile Marine supremacy, and that is the way to do it.

774. Have you ever thought of the figure?—I would want to make a great many calculations, but only as an instance I put down 5s. per cent. We reckoned 2s. 6d. per cent. in order to get out of the stamp duty. The Government would have no necessity to consider the stamp duty. The Government can give you a policy without any stamp duty. It would not affect the Treasury much letting the stamp go any more than on other Government documents.

775. This, of course, would be entirely new business?—Yes.

776. And would you suggest that each shipowner should take out an actual policy of insurance?—You might even put a clause on your register. There is no necessity for an actual policy. It would be perhaps better to attach the policy to the register; and to prove yourself under the British flag you would have to have this document or this clause on your register.

Sir T. Angier.
26 Feb 1907.

777. And it would apply to even the coasting trade—to every ship on the British Register?- Yes. I think your coasting trade would stand just the same chance of being attacked.

778. Do you think that would be a popular measure in the shipping world ;—No, it would not be popular, because they have got to pay something for it. They would like to get it for nothing. But I think they would come to it. On the popularity side, I will give you the case of our Federation. There we were joining up the whole British tonnage, and it meant paying up, and the experience was that a considerable proportion would not come in at the beginning. It took us about 12 months to 18 months before we got them all together, simply because it was something to pay. But ultimately they came in. They saw the sense of it. That, I believe, would be the history on a question like this, if the Government said, We must have you insure if you are British flag. You could easily say that. We do not want any British ship to run uninsured in the case of war, and therefore if you want to be a British ship you must comply with British rules. You say as much as that in various other ways. You say, If you are a British ship you must comply with our Passenger Act, you must comply with our Sidelight Act, with our Grain Loading Act, with a thousand different Acts. All mean money. We all pay for complying with those Acts. This is one more, and not so grievous as the last one the present Government passed.

779. What would a quarter per cent. on the British Register come to?—We reckon 17 or 18 million tons. Quite a rough estimate of £10 a ton would be 180 millions. £10 I think would cover it. Some, of course, are worth £30 a ton, and others are worth to-day, to take a tramp for instance, about £7 or £8 a ton.

780. That would bring in a very handsome sum?—Yes. I would not like the 5s. rate tacked on to my name. I only put it forward as a sum to be worked out at that particular rate, and you will find a certain conclusion follow. I do not say the conclusion would be that the 5s. was the correct rate. I would want to work out a great many rates before I settled what was a fair rate.

781. But any rate must be pure guess work, must not it?—It must, because the period of peace is guess.

782. And the risks of war are guess?—Yes, they are also guess.

783. But you personally would not think 5s. excessive?—I had a fleet of 13 biggish ships, and I took a value of £40,000. That would be a good tramp ship of about 7,500 or 8,000 tons. On £40,000 the premium would be £100 a year at the quarter per cent. I should feel I would rather not see that £100 go, but I should pay it, and then I would know that I would be perfectly safe. I would have no trouble to think about the risks run in case of war. The £100 a year is not a big sum on value like that, but I never suggested that the shipowner should pay the full cost of the indemnity. On the contrary, my contention is that the Government should bear a good share, the mercantile marine being an Imperial question,

784. As regards the value, would that vary from year to year?—A man when he took his registry out would have to form a rough opinion of the chances of war, and if he thought they were very remote he would say, "Well, I shall not put a big value on my ship. I shall content myself with insuring my £40,000 cost ship for £30,000 or £20,000." The tendency would be for the man not to over-value, I think, unless he felt certain of war coming on. For instance, in a war scare a man starting a new ship for a company might say, "This looks very threatening. We will have our whole value covered." But that would work out evenly, because in other years the man would say he would only cover a quarter. I do not see why a man should not have the option of covering as much or as little as he likes. It would not hurt.

785. You would leave the discretion with him?—I would. I do not think it would hurt.

786. But that might not realise the object which you have in view, because he would insure against war risks, I suppose, if war came, if he had under-insured his ship?—That would not affect the Government much.

787. No ; but it would affect the shipping industry, would it not?—Yes ; to a certain extent it would.

788. The object you have in view is to keep the shipping afloat and at work?—Yes.

789. Without undue war risk premiums?—Yes.

790. If, in order to reduce his running expenses in time of peace, he had under-insured his ship, I suppose he would take out a war policy when there was a prospect of war?—Yes, it is quite open to that. Then I put down three ways for valuing : either giving him free option as to the price, or having it fixed that the value for the indemnity shall be the value of the all-risk policy that he was running the year before the war broke out. He would get a fair value then, because they do not under-insure as a rule. Or you might take it on the other basis, to give him an indemnity, that is, the value he paid for his ship less a reduction. The three ways would want considering out. You can do it either way you like. I think it would amount very much to the same thing.

791. But either you must have a fixed value at the beginning of the ship's life or a varying value from year to year, and would there not be a very great difficulty in inducing people to pay a fixed premium on the ship's value all through the ship's life, and a still greater difficulty perhaps, in varying the premium from year to year?—No ; I think the whole thing would accommodate itself as it worked from year to year.

792. Then you think that, apart from the amount, it would be a popular measure in the shipping world?—I think so. I do not say it would go right away like hot cakes, but they would see through it. I think they would agree to it. They have agreed to much worse things. In fact, they have agreed to very bad things, and this is a good thing. You cannot arrive at an absolutely correct premium, but a fair and reasonable contribution, and I do not think it would be a sum to frighten them.

793. (*Sir James Mackay.*) I think you said at the beginning of your evidence that captures during war of British ships would be immense?—Yes, I think so.

794. Have you formed any idea of what the loss in value of British shipping would be during a war?—No ; I think you could do that as well as I could, and I do not think I should be foolish enough to presume to do it. It is a very difficult question.

795. I suppose you would require an Act of Parliament to introduce this tax on shipping to pay for indemnity in time of war, would you not?—I imagine so.

796. Have you reckoned out how much the Government would get from, say a 5s. per cent. tax on British shipping per annum?—They ought to get about £450,000.

797. On £180,000,000 of value?—Yes.

798. £450,000 a year?—Yes.

799. In 25 years' time, assuming we had peace for 25 years, that would put the Government in funds, without reckoning interest, to the extent of something over eleven millions?—That is it.

800. Do you think eleven millions would see them through a big war?—I think it would go a long way. You see, I had some means of judging in this way. I was through the late naval manœuvres, in the 4th Cruiser Squadron, that had the scouting to do, and the watching of the captures. Of course, it was a very inadequate sort of game, but even from that my appreciation of our losses was immensely reduced. I saw in one or two main points the narrow limits of a cruiser, say in depredations. Her limits are very narrow ; she is entirely bound by her bunkers. She could do a certain amount for, say, a week or a fortnight with the biggest, and then it is all over, she has to go to rebunker, she is then going into the jaws of capture nearly always. On the whole, I certainly think that we should be very much surprised at the comparatively small losses we should suffer. They would be sharp and short, I think. There would be a wholesale smash-up for a short time ; then it is to be hoped that our fleet would do its work, and after that the risks would fall off immensely. That is my own opinion.

801. You propose to fix the payment made by shipowners and the value when the ship is registered?—I think that would be a safe way.

802. Sir George Murray put one or two questions to you upon that point. Suppose a ship is valued at £100,000 when she is new, and she applies for registration, in a year's time she is only worth £95,000 or £96,000, and so she goes on depreciating 4 or 5 per cent. every year. I think you would have to alter the value yearly, would you not?—Yes, I am rather inclined to think you

would. I put down three ways of valuing, and I did incline rather to that, the cost price less a depreciation.

803. In 20 years time at 5 per cent. she has run off altogether?—It is off the decreased value, I think I proposed the depreciation.

804. I mean taking it off the original value, as some of us do?—We try to do that for Income-tax, but I would not do it in this case. It would not work. I think from your own experience you would agree that it is too fast to take off 5 per cent. per annum on the original cost.

805. Very few ships are worth much after they are 20 years old now-a-days?—My experience is not quite in conformity with that. I have seen very strange values. I have seen a 20 year old ship sell for more than she cost Of course that is a question of market.

806. I could not quite follow you about that surrender value?—I think it would have to be taken into account before the thing is settled. In case, for instance, of a 50 years' peace, in 50 years time you would have got a monstrous sum accumulated.

807. Yes, the Government then would have something like £35,000,000 or £40,000,000?—Yes. I have not worked it out. Of course it is all a question of figures, but it would be a very enormous sum. We have already experienced very nearly a 50 years' peace.

808. Do you think if they collected that £35,000,000 or £40,000,000 they might reasonably give up the 5s. tax altogether?—Yes, because that would go on at compound interest. But I think every ship would really be entitled to a surrender value after paying for a certain number of years, because her life ceases, and her risk is off.

809. Do you not think it would handicap goods more than shipping to have to disgorge this £450,000 a year? You see somebody has to pay this £450,000; and it is a tax upon shipping to that extent?—Yes, but I look upon ships in this way. Your ship has a life of so many years, and that life bears a certain value in the maintenance of the Empire. Now, goods risks at the outside have a three months' life. There is hardly any portion of the world where goods take more than three months to come to this country, and therefore the life of the goods for this purpose is only a matter of three months. You have only to consider it when war is in progress, because you cannot contend, for instance, that to-day's merchandise business has anything to do with the same period next year. Everything is all wiped out, all risks are wiped off, everything is finished, and the goods are consumed. But with the ships it is a totally different thing.

810. Would it not be a handicap upon the shipping to have to pay this half million a year, which the German shipping, for instance, does not pay?—No, I do not see that, but I would like to demur to the sum of half-a-million, as it should come to possibly less than half this.

811. Somebody has to pay it?—True enough, but it is nothing more to my mind than payment for value received. I cannot see that it would be a tax at all; and I can only say this, that if the German does not do it, I think he is not so wise as the Englishman. He is leaving himself uncovered, whereas we would be covered. The question of the wisdom is a matter for individual judgment. For instance, take a gentlemen like yourself, who does not insure at all. It is entirely your individual position and judgment that guides you to do that. I say I will insure because I am too poor; I have not such a wide area of tonnage as you have. I must insure, and although you come off without paying the insurances I pay, and I dare say you may make an extra profit, I am not rich enough to get that profit. But you pay insurance by spreading losses over your fleet.

812. Then you would make it compulsory on every shipowner to insure against this indemnity?—Yes.

813. Why should you force people to insure if they do not want to?—Because the vast majority of the inhabitants of this Empire say they want to go on as an Empire. That is the only reason. We must keep the Empire up.

814. But I suppose some shipowners want to go on too; they want to continue, and they think they may be able to continue best by working the business in the most economical way for themselves. Would you not give them the option of insuring their own risks, or would you force them to insure?—I would force them to insure. I would make it applicable all round. You cannot do it half and half.

815. Would that not be rather hard? Suppose you take vessels trading on the Coast of Australia. Are you going to make them insure too?—If they want our register.

816. The owners there may say, "We are running no risk whatever"?—How do they know?

817. They might say, by the time the risk comes, our ships will be out of existence.—But they cannot tell. It is only pure supposition as to what risk they are running. They could not say they are running no risk.

818. In the event of our going to war, with what country would you say that our ships on the coast of Australia would be in danger?—Any European Power, or America.

819. What Power?—If we got Germany and France combined, do you mean to say they would not have a shot over there?

820. How would they get there?—How did the Russian Fleet get up to Vladivostock and Port Arthur? They did the steaming anyhow, and they did a lot of threatening.

821. (*Mr. Beauchamp.*) Would you propose to place the same tax or registration fee, one equal tax, on all kinds of ships whether they were fast ships or slow ships.—Yes, every ship entitled to fly the British flag.

822. Then the Cunarder, for instance, would be placed upon the same footing as the ordinary tramp steamer. You assume that it might be a quarter per cent?—Yes, they would pay on the bigger value.

823. They would pay a quarter per cent. Do you think they would consider it reasonable to be asked to pay a quarter per cent. against the problematical risk of capture in time of war, when it would only cost them three quarters per cent. to insure against total loss of their vesssel from sea perils in any one year? It is out of all proportion, it seems to me?—I do not put it fixed at a quarter per cent. in working out the figures it may come out one shilling per cent. A P. and O. or Cunard or White Star ship would have to pay as much war premium as a tramp; her risk is as great, or greater, she is a greater prize to win.

824. Even an eighth per cent.?—I do not see at all why they could possibly grumble or even hesitate; because, first of all they are morally certain that they will have their ships hired by the Government, and they will have such a rate of pay as will allow them to pay any such rate as this.

825. If by the Government, and then the Government would take the risk under all circumstances?—Government does not take the risk of hired transport.

826. If they hire a transport they take the risk of war, surely?—I was not sure on that point.

827. The cost to the Cunard Company of those two new ships alone was £1,000,000 each, I believe?—Somewhere about £4,000,000 altogether.

828. That would be £10,000 a year for those two ships?—Yes, and they can well afford it. They are the last people to consider, I think. They have got their money at 2½ per cent., and they have had every other facility; besides which they have got a certain subsidy.

829. I will take another, the P. and O. for instance. Do you think they would agree to pay a quarter per cent. per annum for war risks, when it would cost them a very small sum if they did insure against sea perils, which they do not. They could easily do it for something like one per cent. against the total loss of the ship. My standpoint is this, first the high valued liners most certainly could not cover *war risk* at much, if any, less premium than lower valued ships, only peace risks come cheaper to them; and second, that we are not discussing the question of figures and private judgment. We are aiming at keeping up the Empire, and I do not see why the P. and O., or the British India, or anybody else, should have a say in the matter. It is for the majority to say we mean to go on; and then we are faced with this fact, that if we do not keep up our mercantile supremacy we shall go under and cease to be an Empire. We cannot afford to face such a position and therefore everyone must come under this attempt to maintain the mercantile marine.

830. But the British shipowner at present kicks against small light dues. Do you not think he would kick still more against a scheme of this kind?—I am afraid that, including myself, I have not a very high opinion of the vast majority of ship managers. But I have this expe-

Sir T. Angier. 26 Feb. 1907.

rience, and my experience I think is a very common one, that they will swallow a very very great deal which they need not, and they will make a great fuss about a thing that requires no fuss. But I am perfectly clear in my own mind that it would take a very short time to bring all to an agreement under some such proposition as this We have tested it in so many cases. We have levied all sorts of contributions, and the Government is now levying, and we are levying among ourselves, a number of contributions, not by any means more necessary than this particular contribution that I am contemplating. As to "light dues," the shipowners' logical contention is, they ought to be paid from the public purse, being for the public good.

831. I do not know whether I understood you correctly, but I understand you to say that when these ships were in that last neutral port going out to Vladivostock an arrangement was made between the owners and the underwriters by which the underwriters paid a total loss upon the ship in some cases?—No, I did not say it was effected, but it was an offer made.

832. I thought you said that the underwriter paid a total loss upon the ship, and in some cases the shipowner retained the ship as well?—An offer of that kind was made. I did not say it was an actual concluded bargain. An offer was made. We had the offer made.

833. By an underwriter to pay a total loss upon the ship?—Yes.

834. And that the shipowner should retain his ship?—Yes.

835. Do you not think under those circumstances a shipowner would prefer to deal with an underwriter who would deal so liberally with him that he should not only pay upon a total loss but that the shipowner should retain possession of his ship?—But of course in that case the deal did not come off, on account of the legal responsibilities.

836. Just one point with regard to the premium to Vladivostock. You think that the premium was 30 gs. per cent., that that was a reasonable premium, and that the underwriters at the beginning, who were in it for the whole time, made a profit out of it. Is it not the fact that almost every underwriter who went into that business really lost money over it?—I am afraid I am no judge on that point. I think I was told by one friend that he had done very well. He was in right away from the beginning; but I would rather leave you to answer that question yourself, Sir. You know more than I do about it.

837. I think in nearly every case where they went in for it they admitted a loss?—I really should not put my judgment on those transactions against your own. You know that much better than I do. But at any rate it proves this, that those who underwrite (and they are fairly astute) after their own calculations asked 30 gs., and they got it and were satisfied.

838. They afterwards wanted to compromise in order to avoid carrying out their bargain?—Those were special incidents. They are only incidents in a large business.

839. All the vessels which were at risk at the time of the fall of Port Arthur were either captured, or the underwriters compromised?—Yes, and the total number would be covered by a score or so.

840. (*Mr. Gladstone.*) You said, I think, that the risks in the event of war with an important European Power would be such as to cause large transfers of shipping to neutral Powers?—As we stand at present, uncovered.

841. You also think that in the event of war a rise in freights would be certain?—Yes, certainly.

842–4. Do you not think the rise would generally be in proportion to the risk easy, and that therefore that would make the owner hesitate as to transferring. He would lose certain advantages, such as the chance of being chartered by the Government, and so on, for which high rates are being paid. Is it so certain that such a large quantity of shipping would be transferred to neutral Powers?—I think so. They would sell, and get out of it somehow. The proportion of tonnage taken out by the Government, if we were fighting, would be very large, but there is always a certain class of ship that would have little hope of ever getting under Government employ. Men having ships of that class would certainly sell or transfer.

SIXTH DAY.

Tuesday, 5th March 1907.

PRESENT:

The Right Hon. Austen Chamberlain, M.P. (*Chairman*).

Sir Thomas Glen-Coats, Bart., M.P.
Sir James L. Mackay, G.C.M.G., K.C.I.E.
Sir George Sydenham Clarke, G.C.M.G.
Sir George H. Murray, K.C.B.
Mr. H. Llewellyn Smith, C.B.
Captain C. L. Ottley, R.N., M.V.O.
Mr. Edward Beauchamp, M.P.
Mr. Henry Neville Gladstone.
Mr. Frederick Huth Jackson.
Mr. Arthur Lindley.
Mr. George H. Duckworth (*Secretary*).

Mr. Alfred Walter Roberts, called and examined.

Mr. A. W. Roberts. 5 Mar. 1907.

Mr. Roberts, in a preliminary memorandum,* had submitted:—

(1) That the main considerations are the maintenance of food and raw materials at a reasonable price, and the continuity of maritime transport and trade under the British flag.

(2) That a panic at Lloyd's on the outbreak of war is unlikely, and that the insurance market, owing to the larger amount of premiums received, would be sufficient to meet the claims that might be made upon it.

(3) That the experience of the Russo-Japanese war tends to show that vessels, except when making for a blockaded port, have a reasonable chance of escaping capture, and that it would be extremely difficult to blockade the approaches to this country.

(4) That it would be impossible for the Government to find men in time of war to undertake the administration of a scheme of National Guarantee.

(5) That the efficiency of the Navy is the best guarantee the State can give, and might be impaired by a sense of false security engendered by a scheme of cash indemnity.

(6) That Scheme A would result in making a handsome present to the shipowner and merchant, and encouraging fraud; that the particulars of

**Vide* note, p. iii.

voyage and time of sailing required would stand in the way of the secrecy necessary in time of war; and that under any scheme Indian and Colonial steamers should be included.

(7) That the value of the ship and cargo should be their value at the time of insurance.

(8) That under any scheme of fixed premium the State would be left with the undesirable risks.

(9) That it is not desirable that shipowners and merchants should always be able to insure by routes presenting very great danger.

(10) That it might be possible to arrange that the Government should in time of war share the risk with the underwriter.

Mr. A. W. Roberts.

5 Mar. 1907.

845. (*Chairman.*) You are an underwriter, I think?—I am an underwriter and an insurance broker.

846. And a member of Lloyd's?—And a member of Lloyd's.

847. You have had a good deal of experience of war insurance?—A good deal. I have been at Lloyd's for the last twenty-two years. I have been a partner in my firm for eight years, and I have been an underwriter for about ten years. During that time I should say my firm has probably done more war insurance than any other firm, certainly as much as any other firm at Lloyd's, from the time of the Chinese-Japanese War on.

848. You have given some consideration to the question that is referred to us?—Yes.

849. And I understand you have formed an opinion on the subject generally?—I have formed an opinion that the National Guarantee is unnecessary. In fact, I go beyond that. I say it is not desirable in any way.

850. Unnecessary, because you think that the present private system is sufficient to deal with any emergency?—I consider that there is in London, and in Liverpool and Glasgow, the largest insurance market that has ever existed, and I can see no reason whatever why this large body of insurance experts should not be perfectly able to deal with any state of affairs that may arise in consequence of our being at war.

851. Of course, the national guarantee is suggested for two reasons, first to prevent a transfer of our shipping to a foreign flag?—That was not put in those questions that were submitted to me. I made out that the main considerations were the maintenance of food and raw materials at a reasonable price, and the continuity of maritime trade under the British flag.

852. You have stated the two objects. You do not consider that there is practically any danger that shipping would be transferred to a foreign flag if we were engaged in a great naval war?—I think it possible that there might be a temporary transfer of shipping to a foreign flag, but I do not think that would be a continuous transfer.

853. It is suggested to us that there might be panic rates of insurance?—That is one of the things that the shipowners hold up, I know. I believe the shipowners are very anxious to have this guarantee. There are two main reasons apparently; first, the transfer of British shipping to a neutral flag; and, secondly, the panic rates at Lloyd's, or in the insurance market generally, neither of which do I think a very serious consideration. If this country were defeated in a war, I mean seriously crushed, it is possible that any steamers that were transferred to a neutral flag might remain; but that is one of the things that you cannot help. In any case if we are defeated our maritime commerce will largely go.

854. I do not think we need consider insurance as an alternative to a navy. We are bound to assume that the navy would be maintained in strength?—Yes.

855. The business of war insurance in the case of Great Britain being a belligerent would, of course, be a great deal larger than in the late war?—Yes, and for that very reason, I think, that the present market would be much more able to deal with it.

856. Will you just make your meaning clear?—You had in the recent war between Japan and Russia a good deal of war risk insurance being placed at Lloyd's; but, as a matter of fact, the whole of that business, certainly the whole of the important insurances, were insurances on steamers bound for Vladivostock. I assume that everybody here knows the position of the port of Vladivostock, that if you have got to make that port you have to go either through the Straits of Tsushima, or north via La Perouse, or via Cape Elizabeth and Saghalien. Practically the whole difficulty concentrated on that. There was no difficulty about placing any amount of goods to Japan, there was no difficulty about placing any amount of goods to Russia, or to China, to go up through the country; the only real difficulty consisted in having to insure steamers bound to Vladivostock, which, as I say, had to go through these narrow straits. A great many underwriters would not take that on, because it was extremely speculative. Practically one cruiser could close any of those three routes, and three cruisers could stop the lot. But that state of things could not occur if this country were a belligerent. The difference between a steamer having to make that port and a steamer bound either from Canada or the Argentine, or any other of the grain ports, to this country, is so great that it seems to me to bear no comparison at all. In the one case you had to make one given port through very narrow seas; in the other you have the whole seaboard open to you.

857. I quite see the difference. Now take the Spanish-American War. What was your experience there?—Do you mean from the point of view of the market being demoralised by captures?

858. Yes?—The question of panic; that is what you really want to find out?

859. Yes?—I am of opinion that no panic would arise, but that the market would be able to deal adequately with the situation. The amount of insurances to be covered would be very large, and in consequence of the world wide nature of British commerce the risks would be spread over a wide area. Underwriters would therefore receive a large amount of premium, and out of this losses would be met, and consequently captures would not have a demoralising effect. What would demoralise the market would be a blockade so effective as to make captures a practical certainty, but while a fair percentage of steamers kept getting through, there would, in my opinion, be no reason to anticipate demoralisation. I would point out that the insurance market is not prone to panic. In the Spanish and American war when a Spanish squadron sailed east through the Suez Canal the Americans were of opinion that the Spaniards meant to attack them on the Pacific Coast. The rates on war risks in the States on American steamers in the Pacific went up to 12 guineas per cent.; here these risks could always be covered, and were covered by my firm, at 2 per cent. Moreover, from the size of this market, there would always be enough competition to prevent anything like a successful combination to charge prohibitive rates.

860. When you speak of the size of the market, are you thinking of the size of the insurance market as a whole, or of the size of the special market for war risks? Is there not a great difference?—There has been a great difference hitherto, mainly for the reason that I wanted to point out, that hitherto where there have been war risks the war risks have been concentrated on one particular spot, whereas when you get the British Empire at war the thing is so enormous that it would appeal to every underwriter. Personally, as an underwriter, I never wrote a war risk in the Russo-Japanese war, but if the British Empire was at war I should certainly write war risks, and so, I believe, would a great many other underwriters at Lloyd's.

861. But in the case of our being at war the risks would vary enormously one from another?—Certainly.

862. Possibly without having any risks as great as those of shipping to Vladivostock, there would still be a considerable number of voyages which would involve a serious risk?—Yes.

863. Would the market for those be large?—I should think quite large. When the steamers were going to Vladivostock my firm placed as much as £120,000 on one cargo bound to that one place, and all at one premium. It was not a sort of panic rate.

864. But the premiums went very high, did they not, to something like 25 or 30 guineas?—Yes, that is quite true; but then we were taking a very highly speculative risk.

Mr. A. W. Roberts.
5 Mar. 1907.

865. But such a premium as that might have a most serious effect upon our trade?—Yes; I think you have got to look forward to the fact that there will be a great rise in the price of commodities if this country is at war, and that the extra insurance will not very materially affect the case. I was very closely in touch with the people shipping out to Vladivostock, and I never found the insurance prevented a deal.

866. But were not the cargoes shipped there almost entirely cargoes to the order of the Russian Government?—Not altogether. There was a German firm there that imported a good deal.

867. But were not the cargoes principally war material, or foodstuffs for the garrison?—Of course, naturally. So in this case it would be foodstuffs.

868. But to us raw material for our manufactures is perhaps as essential, or at any rate nearly as essential, as food?—Quite.

869. There was nothing comparable in the case of Russia in the Far Eastern war to the demand there would be here for cargoes of raw materials to keep the industrial life of the country going?—Quite so. You could hardly compare the two things. There was no difficulty whatever in importing goods into Japan, because there was practically nothing to stop them. What boats the Russians had at Vladivostock practically never came out.

870. There was no serious difficulty even in the early stages of the war, before the Japanese had really secured mastery of the sea?—No. On the 13th July, 1904, for example, I insured a large quantity of rice bound from Rangoon to Japan, which would rather take it within the region of any Russian cruisers at Vladivostock. The rate on that was $\frac{3}{4}$ per cent. On the 29th October I had to insure a large amount of canvas sent to Japan, and the rate was $\frac{1}{2}$ per cent. That was shipped under a neutral flag, but the neutral flag made no difference. In fact, all the steamers captured were under neutral flags. That is another reason why I do not think there would be a great deal of transfer.

871. Both those cargoes were for Japan?—Yes; that was before Japan had command of the sea.

872. Generally speaking, therefore, you would say for even the worst risks there was a market?—There was always a market. For example, after Port Arthur had fallen, after the whole Russian fleet was swept away, my firm insured three steamers to Nicolaiefsk, a very difficult port to make. I insured three steamers from Australia to Nicolaiefsk. We had to pay 50 guineas, but it was done; and they all three arrived.

873. As you have said, one can hardly imagine the same risks arising in a war in which we were engaged?—I should like to point out, too, that if that did occur I think the national guarantee would work very badly there. It is not desirable that merchants and shipowners should always be able to insure by routes presenting very great danger. For example, if we were at war with France, and the French succeeded in blockading the Mediterranean, I should not consider it for the good of the country for there to be a market to insure grain from the Black Sea, or anything from the Black Sea. I should prefer this route to be closed by prohibitive rates rather than to allow shippers to recklessly endeavour to force such a blockade, which they could do if the national guarantee existed. The only result would be that the country would benefit by the captures, and our sailors would be disheartened by the enemy's successes. I should, on the contrary, prefer to see such of our sailors (and the supply would be none too large) as are brave enough to run the risks of capture, concentrate their efforts on routes where there would be a reasonable chance of getting through.

874. I suppose it would be possible for the State, even where giving a general indemnity, if it were to do such a thing, to bar certain routes to cover a case of that kind, where there was a practical certainty of throwing the ship away?—One of the difficulties I want to point out is, first of all, if you have your national guarantee without cost, the country would be making a handsome present to the shipowner and merchant. Moreover, there are always unscrupulous owners anxious to get rid of steamers no longer useful to them, and full advantage would be taken of the chance of getting them captured at the expense of the country. I am quite certain that is a very serious thing.

875. Let me just stop you there to ask what prevents that being done at the present time at the cost of the underwriter. It is true there would be this difference between the scheme of State indemnity without charge and the present possibility of insurance, and then throwing your ship away, that in the latter case you pay a premium, and in the former case you pay nothing; but if your object is to get the whole value of the ship by throwing it away, the payment of the premium becomes a small matter?—Quite; but what I would point out is this: I imagine that if you have a national guarantee there is no limit to it; also that you cannot refuse it; provided it is British flag and British enterprise you are bound to take it. It is a very different thing with an underwriter. You have to present a risk to an underwriter. He is an expert. First of all he knows something of the ownership very likely; and, secondly, he can form a very reasonable idea whether the man is putting an unfair valuation on his vessel, and the work he is going to do. If he does not like it he refuses it. I think there is a great difference: one is optional, the other is compulsory. With the national guarantee you would be bound to take it.

876. I quite see the difficulty of the State distinguishing between man and man—that is, taking into account the reputation of the particular individual?—My point is that the underwriter is an expert and the State is not. At a time when the country is at war, when every underwriter of any experience at all will be absolutely unable to leave his business, I do not see how you are going to get the men to run this. It would be a terrible time, a time of the greatest possible anxiety. I do not see how it could be worked. You ask a man who is really in a position to work such an enormous thing as that to leave his underwriting business, and he cannot do it. His whole fortune depends on it. How are you going to arrange your machinery? Are you going to arrange your machinery now, in a time of profound peace, for the possibility of a war in 15 years' time? In 15 years' time the thing is old-fashioned.

877. Of course different suggestions have been made to us. One is that in some form or another you should take a contribution from the shipowner in time of peace. In the case of any scheme of that kind you must have a machinery in peace already established?—Quite so

878. The other alternative contemplated by Scheme A, which you have had put before you, is that there should be no machinery called into existence until war arises?—Then at a time of great national stress, when the country wants every sovereign it has got, you embark on a scheme that is absolutely without limit. Personally, I am not afraid of what would happen in the event of war. I believe our Navy would protect our commerce. That is only my personal idea, and, of course, I may be wrong. Yet this scheme contemplates that at a time like that, when you cannot easily borrow money, you should start a national guarantee where there is no limit of line. I imagine you have to take £150,000, £200,000, or £300,000 on a venture that is put before you, and you start on a thing which may land the country into losses of millions, and you cannot stop it. An underwriter can stop it; he can close his books; if he sees the thing going against him he can refuse to take another line. The national guarantee must go on, and here the Treasury or the Chancellor of the Exchequer are called on at a time like this to make good they do not know what.

879. You evidently feel there is no possibility of arriving at any estimate of the losses?—I do not think there is the least possibility of arriving at any estimate. As I say, I am not afraid of it. I do not think the rates would go up very much. I do not think the rates would in any case be prohibitive. I think the market would be always large enough for all practical purposes. I can imagine the position that if, for example, there was a tremendous stress for food, and a very fast Cunarder tried to run food stuffs from Canada, there would be an enormous amount to insure. In a case like that the insurance market might not be sufficient to cover the total value at risk, otherwise the State would be competing with the underwriting community. They would be competing with experts, and I think with very unfortunate results for the State, probably. But if there could be some system of co-operation, whereby for example you could place in the market, on current rates of premium, say 40 per cent. of a risk, the State taking the balance, then the State would get round the difficulty of not having the expert; they would simply take advantage of the rate fixed by the expert to cover the risk run.

880. What would be urged against that by many supporters of the scheme for a national guarantee is that the rate fixed by the expert would in many cases be a prohibitive rate, and stop the trade?—I do not think so. In time of war everybody is going to make big profits. It will be big profits or big losses. The merchant who imports the stuff is risking a big loss, or taking the chance of a big profit. You cannot hope to get your raw materials at normal prices in time of war, for many reasons; first of all the difficulty of getting through; secondly, the difficulty of finding sailors to do the work.

881. You do not think that one can get any guidance from past history as to the probable loss in a great war now, do you?—No, I think it is absolutely misleading. The Napoleonic wars I think are only interesting from a historical point of view. The market at Lloyds was infinitely smaller.

882. And the individual risks were infinitely smaller?—Yes. One was sail; the other is steam. I think it is entirely altered.

883. Altogether the conclusion you come to is that the only satisfactory way in which the State can help the trade is by maintenance of a strong Navy?—Yes; I consider the only national guarantee to be the efficiency of our Navy. The money spent on any scheme of national guarantee would, in my opinion, not conduce to considerations 1 and 2. On the contrary, there would, I fear, be a tendency to lose sight of the real insurance for the maintenance of our food supply—namely, the strength of the Navy, and to find a false security in a scheme which would be of great expense to the country, and very little assistance to the considerations 1 and 2.

884. In the answers you have given, and perhaps in the questions I have asked, we have been dealing with both schemes practically, either a scheme for indemnity in return for payment, or indemnity without payment?—Indemnity without payment, I think, is ruinous. It would be so fearfully expensive, and I do not see why the country should do it for the benefit, practically, of the shipowners and merchants. I do not think it is going to help very much.

885. The mass of the population are dependent either on cheap food or cheap material, in order to provide them with the employment which again enables them to purchase their food?—Yes. My belief is that the insurance premium on the venture would not be of such a nature as to really seriously interfere with that. I think it would interfere with the country if they had to pay for these losses without any premium.

886. In the *précis* you furnished me with, I see you also take objection to what would be necessary for such schemes, the supply by the shipowner to the Government of some particulars of his intended voyages?—Yes, I feel very strongly about that.

887. Will you explain to the Committee why?—I do not think it desirable that particulars of voyage, time of sailing, etc., should be furnished. The secret of successful blockade running is undoubtedly secrecy; provided the British flag were in a position to convoy steamers making for this country, say from Canada or the Argentine, on their whole voyage, this would be different, but I imagine that such convoying could seldom occur. Otherwise, I should be in favour of owners not reporting. Leakages do occur, and it would be difficult for a captain to make his report without the chance of this happening. In my own experience there was a steamer captured which was making for Vladivostock. The Japanese were informed of the movements of every steamer making for that port. One steamer was caught, and the Japanese captain, who came on board, was extremely annoyed with the master. He said: "Look here, what have you been doing; we expected you ten days ago." That actually happened.

888. You think, therefore, that any Admiralty instructions should be of a general kind?—It would be far better for the captain to take note of the general instructions of the Admiralty, and to know if possible where he may expect to find the British Navy protecting trade routes, and then take his chance without making detailed reports that might very possibly reach the enemy.

889. Suppose after all we decided upon having a scheme of indemnity, do you think it would be possible to arrive at a satisfactory basis for valuing a ship that was lost?—Of course, it would be possible. But the whole custom of marine insurance is to accept the insured value. The custom of marine insurance is to admit the value of the vessel or cargo insured. It is not, as in the case of a fire insurance. In the case of a marine insurance you always do admit the value. To depart from this plan and to substitute the value which State officials might decide to place on the vessel or her cargo, would certainly not commend itself to either owners or shippers. Moreover, such discussions as to value would entail considerable delay, and half the trouble in all these insurances would be that the payment should be prompt. It would, I think, be found preferable to abide by the established custom, and admit value of the vessel or cargo insured, relying on the experts appointed to refuse unreasonable values.

Mr. A. W. Roberts.
5 Mar. 1907.

890. It would not be possible to fix a value satisfactorily *ex post facto*, say, by taking the cost of the ship and allowing depreciation?—No; I do not think you could begin to do that. I do not think any shipowner would submit to that. Of course, the value of the cargo would be easier to arrive at. You would have the invoice and all the shipping documents.

891. They would have to be subject to control, of course, even then?—Yes. If a man ships in time of war he naturally does not ship unless he is going to make a very large profit, apart from any question of capture, because at a time like that you have a very great deal of insolvency about. The buyer of the cargo may be insolvent, and you naturally would not do business except at a price which would fully compensate you for all the manifold risks you run in consequence of hostilities.

892. Suppose the State were to fix a charge in return for which they gave the indemnity, would Lloyd's and the underwriters generally be inclined to go out of the business, do you suppose?—Not at all. I am perfectly certain they would not. On the contrary, Lloyd's and the underwriters generally would be entirely suited by the thing. The result of that would be, to my thinking, that the merchants and shipowners would know the rates fixed by the National Guarantee. They would, I expect, prefer to deal with the underwriters whom they are used to, and against whom, in case of need, they can go to law, rather than with State officials whose decision it is proposed should be final. Therefore, they would in the first instance offer their business through the usual channels. If the risk were a good one, underwriters would accept it below the National Guarantee rate; but if, in the opinion of underwriters, it were hazardous, they would leave it to the National Guarantee. Consequently, the National Guarantee would be left with the risks that the ordinary insurance market considered undesirable, and the loss to the State would be considerable.

893. The ordinary insurance market is, as you say, a body of experts; but is not this war insurance business practically a bet from beginning to end?—That is a thing you may say of practically any form of insurance.

894. A bet by a person who has experience and technical skill?—Yes.

895. In this case the people would have all the technical skill, but would they have any experience to guide them?—No, because, as I say, there is no war business at all like it. But at the same time you have people trained to that particular habit—that particular business—and I should certainly still consider them experts.

896. And you think that the tendency of rates would pretty closely follow the risks—that is to say, they would be, on an average, sufficient, and not more than sufficient, to give the underwriters a fair profit, having regard to the nature of the business?—Yes. I should think probably there would be very little out of it for the underwriters, but I am certainly not afraid either of panic rates or of any system of ring. In all my experience that never has succeeded in the insurance market, because there is the inevitable competition between the insurance companies and Lloyd's, and between Glasgow and Liverpool and Liverpool and London the market is big enough to prevent that. I am certainly not afraid of panic.

897. Not even in the first few weeks of war? I conceive that the seizures might be out of all proportion in the first few weeks of war to what they would be

Mr. A. W. Roberts.

5 Mar, 1907.

later?—Yes. Still, for all that—of course it is guess-work rather—I repeat, I am not afraid of panic.

898. On the whole, the only practical difficulty that you foresee, and perhaps you do not attach very much importance to that, is the difficulty of placing a very large single risk?—I do attach a great deal of importance to that. If some scheme could be arrived at which, as I say, would not compete with the ordinary market, but would co-operate with it, I admit it would be extremely difficult to arrive at, but I think that would be most desirable.

899. Your idea being that the underwriter should insure the ship, but should transfer a part of the premium and a corresponding part of the risk to Government?—Or that Government should take a certain percentage of the risk at the same premium.

900. They would express their willingness to do that. They would not make it compulsory?—Suppose, for example, an insurance for a very large amount had to be effected, the people concerned—the shipper and the shipowner—would know that there would be a market for them with the National Guarantee after the ordinary market was reasonably full. There would always be, to my thinking, a pretty free market up to a matter of £200,000. I am taking, as an instance, the case of steamers going to Vladivostock, because that was blockade running where the people concerned meant to make a pretty good profit out of it, and they chartered pretty big steamers, and the cargoes were undoubtedly valuable; but the whole thing insured did not, as a rule, exceed £150,000—in fact, I do not know any case where it did. Therefore I take it, as far as regards ordinary business there would be enough market to take it. As for the exceptional risks I would certainly be glad to see some scheme to provide for them.

901. (*Sir George Murray.*) I am not quite sure whether, apart from panic, you contemplate a considerable rise in rates or not, in the case of war?—Personally I should not contemplate a very considerable rise in rates.

902. You said, for instance, that the insurance market could practically take up any risks that were offered, which is no doubt true, but at a price, I suppose?—Of course, you are asking me a question which is very difficult to answer, because it is purely guess-work, but personally I would like to put a concrete case. Take a ship coming from Canada, for example, to this country with foodstuffs; if anybody asked me what the rate of that would be likely to be, I should say about 2 per cent., not more.

903. That would depend entirely on whom we were at war with?—I am taking the worst case—a strong naval combination. If we were at war at present with any one Power I do not think the rates would be at all excessive. The rates on the enemy's stuff would be, no doubt.

904. Then you do not look forward to any considerable rise in insurance rates?—There will be a certain amount of rise. You would have to pay 2 per cent. where you now have to pay nothing. You see, in all the wars that have gone on hitherto it is very difficult to get any real line about it. In the Spanish-American war the only serious damage which was occasioned was caused by the Americans capturing the steamers loading in the Gulf of Mexico. They stood in the Gulf of Mexico, and swept it. That was three days before war was declared.

905. Do you think it quite possible that at, or close to, the outbreak of war rates might rise out of all proportion to the real risk?—All I can say is, I do not expect that.

906. It would be a very highly speculative business even for the best expert that you can imagine, would not it?—My own view of the thing is—of course, it is absolutely guess-work—that underwriters would expect to make a good deal of money out of insuring British enterprises, and therefore they would be anxious to get the business and run it cheap. You must look at the facts, that in any war that has yet gone on, anybody who wanted to capture anything could do so. Suppose the Russians had got a cruiser in the East, at Singapore, they could have captured any of the Japanese ships coming out. There was nothing to prevent them. In a war with this country, surely our Fleet would be able to inconvenience the commerce destroyers to a certain extent. They would not have it entirely their own way, as hitherto they have. That makes it so difficult to form any basis of judgment.

907. But if, as you say, the underwriters would expect to make a good deal of money out of war risks, is not that tantamount to saying that the rates would be above the real risk?—No, I do not think it is.

908. (*Chairman.*) Did you mean by that that they would not expect a big profit on individual risks, but they would do a large business?—They would expect to have a considerable profit, and, therefore, they would be anxious to do the business, and not charge panic prices which would drive it away.

909. (*Sir George Murray.*) Then you also thought there would be a considerable amount of transfer of shipping in the early stages of the war?—I am not a shipowner, and I cannot say. I am not in a position to judge. Personally, I do not think so, because after all the principal business and the most lucrative business for a shipowner surely, would be trading with this country, and he would be getting the highest freights to this country.

910. Yes, but might not he prefer to get them under a neutral flag to his own?—Yes, but a neutral flag does not happen to protect you, at least it has not hitherto. Practically all the steamers that the Japanese caught were flying a neutral flag.

911. It would be a safer flag to sail under than his own, probably?—It might be.

912. But you do not think the danger of transfer is a serious danger?—I do not think it is at all. I do not think it is going to last. The moment the war is over, unless this country is crushed, they will be retransferred. If we are crushed that is another matter.

913. Then you see a difficulty in settling claims under any scheme of indemnity or national insurance?—No, I think you misunderstand me there. I do not see any particular difficulty in settling claims provided you follow the custom of the trade. I do not think it would be any more difficult for the national guarantee to settle claims than the insurance market, but I think there would be great difficulties if, when the loss has come, the shipowner has got to prove what the value of his steamer is. I think that would be a most tedious business.

914. Would that be very difficult?—Very.

915. You admit the value insured in every case now in ordinary practice?—Yes, always.

916. It is never disputed?—I suppose you would exclude fraudulent value.

916*. (*Sir James Mackay.*) The policy is generally proof of value?—The value is admitted in the policy.

917. (*Sir George Murray.*) You have to consider when you take the risk whether there is likely to be fraud?—As a matter of fact fraud so rarely occurs.

918. Why should there be more fraud under a system of national guarantee?—Because it is just the time when you would have a chance, you see. Nowadays, in the ordinary commerce, supposing an owner has got several steamers, and he puts a fraudulent value on them, and he loses one, nobody wants to have any more to do with him. It is over; it is finished; he is found out.

919. Whereas under a system of State indemnity he would go on doing it?—First of all, I imagine the national guarantee would not be able to stop. You would have to go on during the continuance of the war, and, secondly, in a time of war like that it would be very difficult to arrive at what the value of the steamer was. Now in the ordinary course you are offered a steamer to insure. You know the year she is built, and you know she is just on a par with any given quantity of other steamers. Take the ordinary steamer of a value of £10 a ton. If a man put on it a value of £20 a ton you would want some explanation. Who are you going to put up for the national guarantee to be the judge of these things?

920. Do you think it is quite possible for the State to provide itself with the same protection that the underwriters would require in their own business?—As I pointed out, at a time like that it would be very difficult to get any of the men who have been trained in insurance business, simply because everything they possessed themselves would be at stake.

921. But on the hypothesis of a national indemnity they would not have much more to do than usual, would they?—Oh, yes.

922. All that class of business would leave them, I suppose?—If it was taken advantage of by everybody; but, after all, there would be a great many foreigners trying to ship goods to this country. I do not suppose the national guarantee would include them, would it?

923. Not a foreign owned ship, of course; but possibly the foreign owned cargo might be included. But it seems to me that the State would be much in the same position under this scheme as the underwriter is now. If he can protect himself, why cannot the State get the same advice and assistance and protection?—If you are going to have a national guarantee without cost from the State, I dare say you would be able to get experts, but I think that is open to so many objections that I simply cannot understand anybody contemplating it; the expense would be so enormous

924. The main objection would be the chance of fraud?—Not only fraud, but the tremendous expense.

925. On the assumption that there would be a great deal of capture?—There is bound to be a great deal of capture.

926. But would there be more capture without premium than with it?—I am afraid I do not make myself clear. If you get premium with it you have something to pay your captures with.

927. (*Chairman.*) I rather understood you to imply, but I do not think you expressly stated, that the opportunities for fraud would be very much greater in war than in peace?—I think very much greater.

928. The chance of giving away a vessel to the enemy without being detected is much greater than the chance of throwing away a vessel recklessly?—Yes. It is a case of extraordinary difficulty.

929. (*Sir George Clarke.*) I think we may take it that your general view is that there would be no marked tendency to panic arising out of a rise in insurance rates?—Quite.

930. You admit that that depends to some extent upon the Powers with whom we were at war?—Yes.

931. In the case of indemnity you spoke of 2 per cent. as being a possible rate for cargo coming to us Do you think it would be as low as 2 per cent. if we were at war with the United States?—I should certainly think so.

932. With their whole navy on the other side?—Perhaps temporarily the rate would be higher, but then you would draw your supplies from the Argentine and India and the Black Sea. But that is rather one of the points I want to bring out that under a system of national guarantee there would be nothing to prevent shippers going on shipping from Canada. Perhaps it would be very much better for them to ship from a place where they would not be liable to capture.

933. I suppose you have found it impossible practically to make any estimate of the possible percentage of loss in the case of particular wars?—I do not think anybody can.

934. So that we have none of us anything really whatever to go upon?—As far as I am concerned I think there is nothing at all.

935. We none of us can have, in fact. There is nothing really in past experience, because you throw out the experience of the Napoleonic wars. There is nothing really in past experience that could guide us to form an opinion as to what would happen in such an enormous event as a naval war in which Great Britain was involved?—That is quite my opinion.

936. Do not you think it is possible that the mere rumour of hostile ships being in places where they could not possibly get might give rise to a great rise in rates?—I do not think so. At the time of the Russo-Japanese War, when Rozhdestvensky was going out to the East, there was a report all of a sudden that he had detached cruisers to watch the rice ports, because the Japanese were getting pretty short of food, and there was a great trade doing in rice cargoes from Rangoon. The rate never seriously went up. That was a rumour. I have looked up my records of that, and I cannot see that we ever paid more than 1¼ per cent. Of course, it was a rumour; it was not true, and I do not believe the people quite seriously thought it was.

937. (*Mr. Llewellyn Smith.*) Was that on neutral ships?—Yes. All the stuff that was captured was on neutral ships.

938. (*Sir George Clarke.*) Were any insurances made in 1885, when we were supposed to be going to war with Russia?—Yes, but the rates were comparatively very low.

939. Then we must not think that the market would really be governed by telegrams which would arrive from day to day, altering the apparent situation, and therefore giving rise to great fluctuations. We must not accept that view?—I do not think so at all. I think the market would be affected by captures, and nothing else.

940. Not by rumours of the presence of an enemy in different parts where it was known that our trade was in danger?—I do not think so.

941. Is not the general estimate of the risk rather a question of naval strategy and naval knowledge, which underwriters would not be particularly well trained to express an opinion upon?—Quite.

942. For instance, in the Nicolaiefsk case that you have told us of, was not that rather an excessive estimate of risk?—It was tremendously dangerous.

943. A long way off?—The ships were loading in Australia. You have to get round Cape Elizabeth. One torpedo boat, if she could have stood the weather (which she could not), would have stopped that.

944. Of course, anything like rates of 50 per cent. which you gave us would be prohibitive?—Quite. I only mentioned that as an instance, as showing that there is practically always a market at a price. Of course, it would be absolutely prohibitive. I do not imagine that such rates would ever obtain.

945. In normal times, I suppose there are not many underwriters who undertake the business of war insurance, such business as arose, for instance, during the Russo-Japanese war?—There was a large insurance market then.

946. But if the demand suddenly expanded, I suppose the market would rise to the level of the demand?—That is my opinion.

947. I am not quite certain whether you think that private insurance and a system of national insurance could proceed side by side?—I think it would proceed side by side under Scheme B, where you have a national guarantee with a premium. But underwriters would not go out of the business on that account.

948. Therefore if the State had a fixed schedule for particular routes, which lasted the whole time of a war, the underwriters would still do their work, and would under-cut where they could?—Under-cut where they wished.

949. Where they thought it was desirable?—Yes, I think underwriters would very cordially welcome such a scheme.

950. And as security was gradually established by the action of the Navy, I take it that the State system of purchased indemnity would lapse completely, and the underwriters would take on the whole business?—Yes, I should think so. Of course, I do not know what the State indemnity would do. At any rate, the rates would have to be adjusted. In time of war rates fluctuate pretty well every day.

951. Whereas when the supremacy of the Navy has established itself on the seas, the natural result would be that rates would drop?—Yes.

952. And then the State system would fall out practically because the underwriters would be able to give better terms?—Yes.

953. So that the State insurance, or State purchased guarantee, whatever you like to call it, would really be a steadying principle applying during the first months of war rather than a system operating throughout a long period of war?—I think so.

954. Do you think underwriters would act as agents for Government purchased indemnities on commission?—I should think it would be quite possible.

955. In that case the Government would not have to start an elaborate principle of machinery to put its system of purchased indemnity into practice?—I think if such a scheme was suggested that would be the only possible way to work it.

956. I think your general view is that the losses would not be great on account of the protection that we expect from the British Navy, and therefore that the risks which the underwriters, if they were left

Mr. A. W. Roberts.

5 Mar. 1907.

alone in the undertaking, would have to meet, would not be excessive?—That is my view. I say they would not be great compared to the enormous amount of British commerce that would have to be insured.

957. But if that was so, I suppose that would apply equally to the State; the State risks would also not be very onerous?—Not crushing, I quite agree with you.

958. It would apply in both ways?—It would apply in both ways. What I want to point out about the State is this, that where the underwriter can control his liability the State could not. For example, if an underwriter thinks a risk is hazardous, he would not write £100 on it. If he thinks the risk non-hazardous, he can write a couple of thousand pounds. The State, on the contrary, I imagine, would not be able to limit their liability. If it was a national thing, they must take whatever risk comes along. That would be one of the reasons, I think, why it would be very difficult to work the thing without a very great loss to the country.

959. I think I understood you to say there would be a very general inflation of freight rates in time of war?—I hesitate to answer these questions, because I am not a shipowner. I only deal with insurance. I do not really know. You must ask a shipbroker.

960. You attach no importance to a view which has been represented to us, that the rates of insurance would rise so high as to cause ships to be transferred to other flags?—I really do not. I do not say there would be no transference, but I do not think it would be serious.

961. Did you do any insurance on foreign ships during the Russo-Japanese war?—Yes.

962. What sort of rates were charged to them?—When you say foreign ships, I do not quite understand what you mean.

963. Ships under foreign flags?—In the Russo-Japanese war, practically all the ships were under a neutral flag, with the exception of the Nippon Yusen Kaisha, and the Russian Volunteer fleet. The flag did not make an enormous amount of difference. There were rather higher rates paid on the Japanese boats

964. Do you think that, in the event of war, neutral ships and neutral cargoes would have to pay considerable insurance rates?—Certainly, if they were coming to this country, if they were trading with either belligerent.

965. If they were trading with anything which might come near the definition of contraband of war?—You remember the list that the Japanese and Russians drew up as to what was contraband. It was practically everything.

966. You gave us to understand it was rather difficult to fix values under any State system, that the State might be deceived in the matter. If values were taken for the purpose of the State premiums at the rate which has been fixed for the marine insurances of those ships, would the State be fairly secured?—Yes, the State would be fairly secured. I should think perhaps that might meet the objection.

967. If the State were prepared to accept such estimates of the value of ship and cargo as had previously been accepted in the open market for the purpose of marine insurance, do you think the State would be fairly secured?—If the shipowner would be content with that, of course. If you are engaged on a particularly hazardous enterprise, or if you have got a particularly lucrative contract in the event of war, surely you must recoup yourself by having a higher value on your steamer. But at the same time that might be met by a percentage. I think what you say would meet that case.

968. I presume you would expect, supposing the State premiums did not cover every marine risk, that all marine risks would go on unaltered during the war?—Yes. Undoubtedly marine risks would rise a little.

969. But they would be dealt with entirely on the open market; the State would have nothing to say to them?—Yes, I should think so.

970. And ship and cargo owners would be likely to continue their marine insurance, even if they got a war insurance?—Yes, of course they must.

971. (*Sir James Mackay.*) Do you think that marine insurance rates would rise in the event of war?—Yes.

972. Why?—If you are trading to a country, and your lights are out, and you have any amount of steamers not showing lights, the risk of navigation is immensely increased.

973. If trading to an enemy's country?—If you are coming up the Mediterranean, for instance.

974. In the case of trading between countries where lights are not out, I suppose the risks would remain the same, or do you think there would be a general tendency to rise?—It is not of very great importance, but I think there would be a tendency for the rates to rise.

975. (*Chairman.*) You know the policy of this country is to keep all its sea lights burning in time of war?—That I did not know.

976. That is so, on the principle that our interest is to get our own shipping in?—Yes. Of course, there would be a great many other people who would not.

977. (*Sir George Clarke.*) All neutrals would be bound to keep their lights burning?—Yes. Anybody running a blockade would not have lights.

978. (*Sir James Mackay.*) I think you said you did not think the rumours of enemies' cruisers being in the neighbourhood would be likely to put up rates?—I should not anticipate that.

979. Did not they do so in the case of the Russo-Japanese war? I think you said the rate was about 5s. at first?—It went up to three-eighths.

980. I think you said it went to 1¼?—Yes. The only rate I have got here is three-eighths.

981. And it rose to 1¼?—Yes, for a very short time.

982. I think it rose as soon as they got to Mauritius and to Mozambique and that neighbourhood. The rates went up materially then?—I should not call that a very material rise.

983. About three times the amount?—But on the value of your cargo it does not amount to very much.

984. (*Captain Ottley.*) You say in the case of the Russo-Japanese War the neutral flag was not any great protection against capture?—I am not aware that it was ever a protection.

985. Do you think that perhaps that was partly due to the fact that, except for the Tokio-Yasen-Kaisha and the Nippon-Yusen-Kaisha in the case of Japan, and, of course, the volunteer fleets in the case of Russia, there was nobody to carry the commerce except neutrals? That would be partly the explanation why any contraband of war or anything should come in neutral vessels?—Yes, I think so, but at the same time there is no instance where your neutral flag protected you. Whether there was or was not the neutral flag in that war, it did not constitute a protection.

986. Still, I dare say the general clauses of the Declaration of Paris did act as a very material protection—that is to say, when a neutral ship was not carrying contraband of war, and was not consigned to a blockaded port—Russia, for instance, if she captured that ship did so at an enormous risk. Of course, it is palpable that is so?—Yes.

987. In other words, that in any future war between countries who hold the Declaration of Paris to be binding on them, the neutral flag should be sufficient protection except in the case of vessels carrying contraband of war or in the alternative in case of their being blockade runners consigned to blockaded ports?—That is a thing on which I am absolutely unable to express an opinion. All I can say is that all my experience is the other way. Do you remember those three fur steamers that the Japanese caught from Kamstchatska and the case of the Knight Commander?

988. Where were they consigned to?—They were consigned to the United States, I think. They were sailing under neutral flags and carried neutral cargoes.

989. Had they contraband of war on board?—They had furs.

990. Was that held to be contraband of war?—The Japanese caught them, and the owners had to proceed against them in the Prize Courts, and it is two years now before they have come back.

991. The only possible way in which they can be condemned is if it can be proved they contained contraband of war?—Yes. At the same time, hitherto it seems to me they have captured them, or sunk them in one or two instances, and you get redress in two years' time. After all, it is to my mind a theoretical advan-

tage, but it is not a practical one. At the moment you have got to pay.

992. But do not you think in the case of a war between ourselves and France, for instance, it would be a very practical consideration if France attempted to capture an American ship running to a British unblockaded port and containing material which was not contraband of war? In that case I submit the American ship would in all probability be allowed to go in?—I do not agree with you. In the time of war, if we were at war with France, and an American ship was going to an unblockaded port in this country, I should think she would be stopped every time.

993. And carried into a French port?—Yes.

994. Would you go even so far as to say she would be condemned as a prize?—I say that is my experience of what happened in the Russo-Japanese War.

995. But, you see, we thought the Russo-Japanese War was of rather an exceptional character?—It did not alter the fact. Were not they both signatories of the Declaration of Paris?

996. Not Japan, I think. Anyhow, I was putting it on a much broader ground; the question of the probability that such an action as that on the part of France would raise such a protest in the United States as would probably result in bringing the good understanding between the two countries into jeopardy?—Of course, I am only speaking as an insurance expert, but my experience is entirely the other way. I think you have to remember this. The United States in the event of war between France and ourselves would be making money hand over fist. Why should they embroil themselves? They could make sufficient diplomatic representations, and they could bring pressure to bear to obtain some undertaking to be put before the Prize Court. Meantime the ship would be captured, and the underwriters or the national guarantee would have to pay.

997. Really you take the extreme view that with regard to a vessel under a neutral flag it is as though the Declaration of Paris did not exist; the vessel under a neutral flag is no more protected, although she is not consigned to a blockaded port, and although she does not contain contraband of war, than if she was consigned to a blockaded port?—All I can say is my experience is that the Russians sank a boat under the German flag, and the Japanese sank boats under all sorts of flags. I can only tell you what is my experience, and I again refer to the case of the Knight Commander.

997*. I think it does bear upon the question that the result of Russia's action in that respect was to bring us very close to grave complications with Russia, and I suppose that history would repeat itself. Do you not think so?—Yes.

998. In other words, there would be a tendency then for neutral ships not to have to bear such heavy rates of insurance as belligerent ships?—I think there would be that tendency.

999. Do you think, for instance, that in a war between England and France, in which the United States was neutral, the United States ships would have to pay the same war premium as British ships?—I should say pretty much the same.

1000. If there was any difference it would be in favour of the neutral?—Certainly, what difference there was.

1001. The difference, such as it was, in favour of the neutral would be tantamount to putting a difficulty in the way of the British ship. If there were two ships waiting for cargoes, one flying a neutral flag and the other flying the British flag, inasmuch as the neutral flag would pay a lower premium, she would be able to take the cargo at a lower rate?—I think that is so.

1002. To revert to the question of the two alternative schemes which are at present before the Committee, there is the scheme of gratuitous guarantee, which I think you say would not be acceptable to the country at large?—I think it would not be.

1003. The scheme of insurance, you think, to the extent that the British ship would have to pay a premium, would be in effect a bounty given to the neutral. The freight of the British ship would have to be so much greater by the war insurance than the freight the neutral ship would take?—Yes.

1004. That being so, the gratuitous indemnity being, as you think, not a possible scheme, and the effect of purchased indemnity being tantamount to a bounty upon the neutral ship, do not you think there is a danger that the neutral ship will be able to undersell the British ship and take cargoes at such a low rate that the British ship would be unable to get cargoes?—No; they would not be able to do the trade. There is not enough of them. There would be an enormous demand. I do not anticipate for a moment at a time like that they would be able to do that really in such a way that the British steamer would go without its freight. You must realise the fact that there would be a great wastage of tonnage. There would be all the vessels taken off for transport; all the vessels taken off the ordinary freight market for the purposes of war, and you would get an extraordinary shortage of freight. None of these ship-owners would be having their ships laid up; they would all be working as hard as they could.

Mr. A. W. Roberts.

5 Mar. 1907.

1005. Notwithstanding that the neutrals would be underselling?—It is not a question of underselling. When you want every ton of shipping you can get hold of, there is not much underselling. I think the ship-owner would be in a very strong position and would be able to dictate his own terms.

1006. Although the war rates on British shipping may be very considerable?—Yes, but the war rates on the neutrals are not going to be nothing at all. What difference there is is in favour of the neutral; but I do not think it is at all reasonable to draw a sort of picture of the British ship-owner with his ships all laid up and not getting a freight, while the neutral flourishes at his expense. In the Russo-Japanese war, which was a comparatively little war from the maritime point of view, there was a tremendous demand for freight.

1007. For what it is worth I think you would agree that it would be preferable, if possible, to raise your fund out of which you are going to pay for these losses, supposing there is some system of national guarantee, by a tax which would hit the neutral and the belligerent merchant ship equally, if that was possible?—Yes, if that was possible.

1008. (*Mr. Llewellyn Smith.*) On the last point, about the shortage of tonnage, would not there also be a shortage of goods to be carried by the cessation of direct trade between the belligerent countries? You say all the shipping would be wanted because there would be such a shortage, such a number of ships taken off for transport, and so on. But also foreign trade would be checked; the direct trade between the two belligerent countries would be very greatly diminished, and perhaps cease. Would not that about balance it?—I do not think so. You would have to get enormous supplies into the country of war material and things like that. You would have to make much larger provision, because you would have rather to allow for your captures.

1009. In answer to Sir George Clarke, you said you thought that one method of valuing the vessels captured would be to accept the value fixed by a policy of marine insurance?—Yes.

1010. But are not there a large number of vessels, as a matter of fact, not insured with underwriters, on which there are mutual schemes, or big fleets which would insure themselves?—Yes, there are; but I do not think it would be very difficult. I think those are the sort of people whom you can trust.

1011. Where fraud would not be anticipated?—Yes.

1012. Do you think that your general objections to an unlimited system of national guarantee would be to any degree overcome if it was limited in point of time—that is to say, confined to vessels afloat at the outbreak of war, or a limited number of months afterwards, and then ceased, if the State took the risk of vessels actually afloat?—I am bound to say that was not a point that ever occurred to me, of a short guarantee. But speaking on the spur of the moment, I should think that something of that description might be distinctly advantageous, because if there is going to be any capture it is going to be in the first months—capture by vessels following your boats into their loading ports, or practically just outside their ports. I think if a scheme like that could be formulated it would cost the State comparatively little, and could be comparatively easily worked, but I admit it never occurred to me, and I have not really considered it.

Mr. Robert Bertie Lemon, called and examined.

Mr. R. B. Lemon.

5 Mar. 1907

Mr. Lemon, in a preliminary memorandum,* had submitted:—

(1) That in marine insurance each risk has to be dealt with on its merits, and that the insurance market is wide and ever varying.

(2) That a National Guarantee, though attractive in theory, would be unworkable in practice.

(3) That the division of sea risks and war risks between the underwriter and the Government would lead to dispute, and to the continuance of war insurance in the ordinary way.

(4) That the category of losses, which it is suggested that the State should cover, is not so full as that included in the "Warranted free of capture" clause of a Lloyd's policy.

(5) That under an indemnity restraint and discrimination would be necessary, and that the conclusion arrived at during the recent Naval manœuvres, viz., that the initiative as to time of sailing, route to be adopted, etc., should be left to the shipowner, is incompatible with these conditions.

(6) That great difficulties under any scheme would arise as to the valuation of ships and of cargo, and that the investigation of claims would lead to great delay in settlement.

(8) That it would be advisable to admit Indian and Colonial vessels to the benefit of indemnity.

(9) That it would be impossible to fix a premium that would apply equally to fast and slow ships.

(10) That it might be possible for the State to effect insurance in co-operation with underwriters.

(11) That sailing vessels should be excluded from any scheme.

(12) That the doctrine of "Free ships, free goods," in the Declaration of Paris is opposed to the true interests of this country.

1013. (*Chairman.*) You are an underwriter, I think?—Yes, underwriter to the Marine Insurance Company.

1014. You have had a large experience of ordinary marine insurance?—Yes.

1015. Have you had much experience of war risks?—Yes, a great deal. We had a serious experience the year before last.

1016. Do the same considerations apply in fixing your war rates as apply in fixing ordinary marine rates?—Scarcely, because of course in fixing war rates we are not supposed to know very much about war rates, because we very seldom have the experience. But in fixing ordinary rates there are many things to be considered which do not come in when you are fixing a war rate.

1017. At any rate, questions of the character of the ship-owner and the character of the ship apply equally to both classes of risk?—The question of character would apply very considerably in cases of war risk, because it is to a great extent a question of moral hazard, and the ship-owner who is beyond suspicion is a far better man to deal with than a man who recklessly runs his property into danger for the sake of getting the insurance money.

1018. And therefore you mean that it would be necessary to take each individual risk on its merits?—Most distinctly.

1019. It would be impossible to make any general tariff applicable to all persons or all ships?—That is impossible, because you have the fast liners, which go 21 knots an hour, and which could very likely escape when a war vessel was chasing them. Where you have little tramps steaming 9 or 10 knots it is practically impossible for them to get away.

1020. Then I come to the special subject of our inquiry—the war risks. You suggested, in the *précis* you have been good enough to send me, that even assuming our indemnity was as comprehensive as that given by an insurance company, or by Lloyd's, the position of a person insured against marine risks by a private company and against war risks by the State would be less good than the position of one who was covered for both risks by the same policy?—Naturally, because it is very possible that a man may fall between two stools. In many cases it would be a complete indemnity, no doubt, because if he cannot claim on one policy he can claim on another. But there are circumstances under which a man would very possibly come to grief. On one policy the underwriter would not be liable, on another policy he would not be liable, and therefore as neither of them admit liability, the probability is that the man would not get his money. If he has one policy he knows perfectly well that covers him for everything, and he can claim on that, and naturally whatever happens, whether it is a sea risk or a capture, it must come on to the one policy.

1021. What you suggest is that if the sea risk and the capture risk were separated there would be certain classes of cases in which it would be very disputable to which class the risk belonged?—Certainly.

1022. Perhaps you will give the Committee some instances of the kind of case?—Certainly. In the event of a missing vessel, suppose this country is at war, and this vessel may be in the vicinity of some of the enemy's war ships, that vessel probably is never heard of. Who is to know whether she comes under the capture clause or whether she comes under an ordinary sea peril? But there are one or two cases which I instance. There would be cases under which it would be difficult to know under which head to place the loss, whether from sea policy or from capture. For instance, an explosion, whether from within or from without, that is to say, supposing the boilers were to explode and wreck the ship, that would come under a sea policy, but if the enemy were to fire into them, of course, that would come under the capture policy. But who is to know? You cannot find out. Then there is another question, a vessel barratrously delivered to the enemy and destroyed by him. Under which policy would that come?

1023. It surely ought not to come under any policy at all?—One would think not.

1024. How do the private underwriters protect themselves against a fraud of that kind?—There is a clause in the policy.

1025. I meant not so much what is your legal defence as what is your practical protection. If you can prove barratry, of course, that is a sufficient defence?—That is quite sufficient defence.

1026. (*Mr. Lindley.*) There is a special clause in the policy covering barratry?—Yes.

1027. (*Chairman.*) Yes, I understand there is a special clause in the policy, but you see my point is that that clause does not give you protection unless you can prove barratry?—We had a case the other day of a French vessel called the "Jeanne d'Arc." The vessel was sunk by the order of the captain, there is not the slightest doubt about it, and the crew rowed into St. Michaels, and as they rowed into St. Michaels this vessel, which was supposed to be sunk by the captain, was towed into St. Michaels at the same time. We had a tremendous long suit. It was three years, I think, in the French Courts, but we won, and we had not to pay. It was almost as bad as paying a total loss. It was a tremendous expense, but we showed up the owner and ruined the man, whose name is Paul Dore.

1028. Are there any other cases where you think difficulties would arise in deciding whether it was a marine risk or a war risk?—Take the case of a vessel seized as a prize, and in course of being taken to an enemy's port for adjudication. She is lost by a sea peril, or by intentional scuttling while in the hands

* *Vide* note p iii.

of the enemy. Under which policy is that to come? She is first of all seized as a prize, and as she is taken in she is lost by a sea peril.

1029. These questions do not arise under an ordinary policy, because the ordinary policy in such cases covers them for everything?—For everything.

1030. But does it not frequently happen that the underwriters who take a marine risk do not deal with war risks at all?—Very frequently.

1031. In that case is it not necessary to have a second policy?—Yes. There is a necessity there, of course. But I am only instancing now, when a war is actually going on, then it is desirable, I say, for a man to cover himself with one policy if he possibly can. There are many men who during the currency of a war will not write war risks.

1032. When that happens these questions would have to be decided by agreement or in the Courts?—Yes, they would be decided in the Courts, I should take it, if neither policy would admit liability.

1033. Has there been much difficulty of that kind within your experience?—No, not very much, because we have had very little experience of any very serious maritime warfare.

1034. But you think in the event of a serious war such cases would become more numerous?—Yes, I should think so, judging from the serious losses that we had in the Russo-Japanese War.

1035. May I ask you to look at the Schemes that were sent to you? In regard to the losses which it is proposed to cover, I think you have suggested that our clause is not as full as that habitually given by underwriters?—You do not say anything about riots and civil commotions.

1036. (*Mr. Beauchamp.*) That is excluded purposely?—The proposed clause is not quite so full as that sometimes granted by the underwriters, which includes "riots and civil commotions," and reads as follows—namely, "Warranted free of capture, seizure and detention, and the consequences thereof, or any attempt thereat, piracy excepted, and also from all consequences of hostilities, riots, civil commotions, or warlike operations, whether before or after declaration of war." That is the clause which is sometimes inserted in policies. I do not quite understand whether under this scheme it is proposed that a ship owner should pay a premium during times of peace to enable him to get indemnity during time of war. It is not quite clear in this paper whether it is intended that a man should always pay a premium whether there is war or peace.

1037. (*Chairman.*) Certainly not in Scheme A. The basis of Scheme A is that the ship owner or cargo owner shall be given a free indemnity without payment of any kind. The basis of Scheme B is that he should pay some premium in return. Of course, you might adopt either of the two systems you suggest in regard to that premium. It might be a small sum, almost in the nature of a registration fee, in time of peace, by which a fund would be accumulated to meet those losses, or it might be something like a war premium charged only in time of war. But I think on the whole you are opposed to any scheme on these lines?—I am absolutely opposed to the Government undertaking any scheme of this description, because it is utterly impossible. The Government have not got the machinery to work it, and to my mind it is utterly impossible to put all ship owners on an equality and all steamers on an equality, which no doubt the Government would have to do. Every ship owner is a tax payer, and he has a perfect right to have his vessel insured. You cannot discriminate. That is where I consider that we private underwriters have the pull, because we know to some extent the character of the person with whom we are dealing and we can discriminate; we can refuse one man's vessel, and we can take another. That is what we are there for, to exercise our discretion.

1038. What would be the result of your exercising your discretion. Would it probably lead to very high rates in the early weeks of a war in which we were engaged with a big naval power?—Of course it is difficult to say what you would consider very high rates. Would you call 20 per cent. or 30 per cent. high rates?

1039. Yes?—I may tell you that when the coals were being shipped out during this last war a premium of 30 guineas was paid regularly on all the coal shipments that went out to Vladivostock for the benefit of the Russian Government, and I may also tell you that probably four out of five of them were captured.

Mr. R. B. Lemon.

5 Mar. 1907

1040. Yes, but that was of course a very special risk?—It was a special risk.

1041. In the first place the coal was clearly contraband?—Clearly contraband.

1042. And then the cargoes were being shipped to a port which was very nearly blockaded, if not quite?—Yes. They were the very worst of risks, I must admit.

1043. The risks that we have to contemplate would be very much less than that in the majority of instances?—In the majority of instances very probably.

1044. But, on the other hand, the goods we require for the maintenance of our industry and the feeding of our population would not stand rates of that kind?—Certainly not, but then it just depends what they declare to be contraband. Suppose they bring in grain. Grain would very probably be declared contraband. You cannot tell. We never know what is contraband and what is not, and that was the trouble with this war. I see this morning that the Germans have got some indemnity out of the Russians again. That was one of the German ships that was sunk, clearly with no contraband, at least they did not state it was contraband, and therefore they had no right to sink the vessel. It would be an excellent thing if we could get our own Government to take a leaf out of the German Government's book.

1045. The more the other belligerent includes in his list of contraband the higher will be the average rate charged on shipments to this country?—Yes. You would have to discriminate between what you consider contraband and what not, because some of the risks are covered at ¼ per cent., or at ½ per cent., on goods that one would naturally suppose are clearly not contraband. But whether a thing is contraband or not, like kerosene oil or anything of that sort, which had never been declared contraband, they might consider it contraband, and under those circumstances they might destroy your cargo.

1046. Would not the effect of all this be to make the insurance of war risks a very speculative business, for which underwriters would be forced, at any rate in the early stages, to charge very high rates?—Of course, very much depends upon the circumstances. If we were at war with a Power like France or Germany, with a big navy, it naturally would be a very serious matter, but with a smaller Power it would not be so bad.

1047. I am contemplating the case of a really serious naval war?—In a really serious naval war you would have to charge high rates, but not such enormously high rates as those that were paid on the actual contraband. But it is a very difficult thing to say what sort of rates you would have to charge; so many circumstances would have to govern your mind in the fixing of a rate.

1048. Have you any experience in war risks that is really useful in guiding you. I mean has anyone?—The greatest experience we have had has been in this last Russian war.

1049. But it would not be easy for you to draw inferences from that to the conditions which would prevail if we were engaged in war with a great naval Power, would it?—It would give us some sort of line to go upon, I think, although of course it is almost impossible to say. I can remember when France and Germany were at war in 1870. There were more sailing ships than steamers in those days. We used to get 15 guineas to 20 guineas per cent. on vessels going round from their port of call to the coast, getting round to Kingstown or Liverpool, and that paid us uncommonly well.

1050. What ships were those?—Little grain ships coming from the Black Sea, going to a port of call, and then going on to their destination.

1051. To their destination in a belligerent country, in Germany or France?—Oh, no; going from one port of call to another port in the United Kingdom. They would be little German ships. They would be belligerent vessels, of course; not neutral vessels.

1052. I did not quite understand where the war risk came in?—They were not neutral.

1053. Supposing we were trying to frame a scheme somewhat on the lines indicated in those papers, have

Mr. R. B. Lemon.

5 Mar. 1907.

you any observations to make about the conditions which are to attach to the grant of an indemnity as laid down there?—Do you mean to say having regard to the premium which is to be charged?

1054. Just look at your paper, paragraph 5?—"Conditions to be complied with to secure indemnity. These would involve necessarily considerably delays, especially if a vessel were in a foreign port. Arrangements would have to be made by cable resulting in expense and loss of time."

1055. Arrangements of what character do you mean? Do you mean for conveying to them the instructions of the Admiralty as to the line of route?—Certainly. I take it if the Government think of supplying this indemnity, the shipowners would have to be under the control of the Admiralty under all circumstances.

1056. Under the general control of the Admiralty?—Yes, under the general control of the Admiralty. I say that that would take away a great deal of the safety, because the initiative of shipowners would not have fair scope.

1057. On the whole you think that a ship will stand better chances if it is left to the discretion of the captain to find his way home than if we try from here to give him general directions?—Certainly, I do, under certain restrictions. Of course, the Admiralty would let the shipowners know the safer routes that are to be traversed, but I do think that it would be a very serious thing to tell the captains of the various steamers what time they have got to sail.

1058. I do not think we contemplate that. It is rather that the Admiralty might perhaps at particular places and at particular times warn vessels that it was not safe to leave at all, or that a particular route was unsafe at a particular time; but their directions would be in any case of a very general character. Would much more be involved than what the shipowner would be naturally anxious to do even if there were no question of a State guarantee?—You see that all comes under this first head, this question of whether a shipowner is a man of good moral character or not. A man who wants to lose his vessel could very easily lose his vessel, and run into some risks which a cautious shipowner would not do.

1059. I was asking you some questions just now on that point. What I do not quite understand is wherein the difference will arise on that point whether the man be insured with an underwriter or given an indemnity by the Government. Why is it easier for him to throw away his ship if he is indemnified by Government than it would be if he had insured with an underwriter?—There again you see the underwriter would discriminate, and if he knew the man was altogether a wrong character he probably would not undertake his risk at all. That comes back to the first point—that the Government have to take every risk. They have to take Dick, Tom, and Harry, and they cannot discriminate at all.

1060. That is really the fundamental difficulty, you see, that the Government cannot discriminate as an underwriter would do?—Certainly, and I think that is a very grave difficulty, too.

1061. Would there be great difficulty in your opinion in the State ascertaining with fair accuracy the value of a ship for the purposes of paying a loss?—Yes, I think there would. You see when we have to underwrite a risk we always fix the value beforehand, and it is within an underwriter's knowledge to know fairly well what the value of that ship ought to be. But if after a loss comes the value of the ship has to be fixed, naturally I think the shipowner would endeavour to get as much as he could out of the Government, and I think there would be many squabbles about the value that would have to be paid.

1062. If you took practical men engaged in the business of insurance now, could not they name with approximate accuracy a value for any ship on knowledge which is common property?—Yes, I think so. By practical men, you mean experts in the business?

1063. Yes?—Yes, certainly.

1064. Without necessarily surveying the ship?—Oh, yes. You can tell by your Lloyd's book.

1065. Why could not the Government act upon the same information, with the assistance of practical men?—Yes, they might be able to do that, but then after a vessel is lost would not that lead to a great many squabbles with the shipowner with regard to the value? The shipowner would come to the Government and say, "My vessel was built for a special trade. It is everything to me to keep the ship; it is not the money I want, I want my ship, and as you cannot give me my ship, I want to have as much money as I can out of you."

1066. That would mean that he would make a claim, not in respect of the value of the ship as a ship, but because of its value to him at the particular time for a particular purpose?—Certainly. Ships are built for their special trades. If you had a vessel that was built for the Suez Canal you would not think of trading her regularly across the Atlantic. Ships are built with special construction for all their special trades as a rule. The tramp of course is a different thing.

1067. But the bulk of the Mercantile Marine is not of that special character, is it?—The bulk of the Mercantile Marine I suppose would be the tramps.

1068. In any case, that is really assessing the loss not so much on the value of the ship as on the profits which the ship might be supposed to have made?—I think you could assess the loss of a tramp fairly well. I do not think there would be very much difficulty in that, because there is just the value of so much per ton that covers the vessel. Then, of course, you have to consider the age of the vessel, and her horse-power, whether she is a 10-knot boat or a 15-knot boat, and all that sort of thing. But you certainly would have a great deal of trouble in assessing the values of the different liners and the passenger boats.

1069. You do not think it would be satisfactory to take their cost less an allowance for depreciation, such as you are allowed for income-tax purposes, for instance?—A fixed depreciation of 10 per cent. per annum?

1070. No, 4 per cent., I think?—You must take more than that. I daresay a vessel will depreciate in the first few years 5 or 6 per cent., but when she gets over three or four years old she depreciates more than that.

1071. Ten per cent. on the depreciated cost?—No, the original value. As she gets a little older you must take off a great deal more for depreciation.

1072. That is specially true, I suppose, of the great liners, the great passenger steamers?—Certainly, because they get out of date.

1073. It would not apply to the great cargo steamers, would it?—Yes, I think it would apply to all steamers.

1074. Would it apply to the slower boats on the Atlantic lines, that carry great numbers of emigrants out and come home loaded with grain?—You see these liners now have to be kept up to date so much that really when a vessel gets to 10, 12, or 13 years old, she is practically an obsolete vessel.

1075. What becomes of her?—She goes on, and she is probably sold. The P. and O. generally sell their boats. They have very few old boats in their service now. They keep on building all the time, and they get rid of their old boats.

1076. Would not the frequency of those sales make it fairly easy for a body of practical men to settle a fair price for a vessel of any given age?—No, I do not think it would, because you see when they want to sell these old boats they have to almost give them away for the value of the material. They have to sell them very, very cheaply. The P. and O., as a rule, sell their boats to the natives in India, and they trade out to the inter-Indian ports.

1077. Suppose the State took a payment from the shipowner in return for the indemnity, that might involve the shipowner taking out a policy with the State. In that case would there be any difficulty in agreeing the value beforehand?—There ought not to be. I do not know why there should be. But I think the Government ought to have some expert advice as to whether a man over-values his vessel or not. There are many men who no doubt would over-value the vessels and send them into the most hazardous trade they possibly could.

1078. Do you think there would be any difficulty in the State getting the assistance of experienced underwriters and practical men to act on a Board of Valuation?—I do not suppose there would be any great difficulty. Not that I would suggest it, because I think there are very many troubles that might crop up here. If there is a scheme put forward to get the

benefit and the skill of underwriters, that is the only way I can think of in which the Government would be able to undertake this business.

1079. But the idea you have in your mind, I think, is that the State should be, as it were, a partner with any underwriter who took a war risk, that the State should take a share in any war risk that was underwritten?—Scarcely that. I say here, in No. 10, let the underwriters accept war risks upon such terms as seem to them to be reasonable, and the reason for that is this: it is impossible for the State to accept one risk and refuse another. An individual can do that; he can accept what risk he considers is a fair risk to run, and he can decline another absolutely. That would be an utter impossibility for the State.

1080. But will you explain to the Committee in what way you think then the State might co-operate with the underwriters?—Let the underwriters accept war risks upon such terms as seem to them to be reasonable, upon the understanding that a percentage of their profits be handed over to the Government for the benefit of the taxpayer, in consideration of the Government paying any excess of loss there might be over the premiums received. It would thus be to the interest of the underwriters to conduct the business on as judicious and careful lines as possible, because, if they made a loss, they would receive no reward for their labours.

1081. But what would be the advantage to the State or the shipowner in a scheme of that kind? That would be an advantage to the underwriter, because it would guarantee him against loss?—It might or might not be an advantage to the underwriter. Of course, it would guarantee him against loss. But it is a scheme which I do not put forward; it is only a sort of suggestion. If the State is going to insure war risks, all I say is that that is a suggestion which might possibly be a better one than Government insurance entirely.

1082. But the only possible reason for the State having anything to do with these war risks is to keep the cost of insuring against them at so moderate a figure that the charge will not interfere with our trade. Your suggestion would hardly effect that, would it? It would have no effect upon the rates charged, which might be as high as ever?—No, it would have no effect upon the rates. Certainly each man would have to decide what rates he would charge.

1083. I do not quite see, as I say, where the advantage either to the general trade of the country or to the State would come in?—I do not know that there would be so very much difference.

1084. But you yourself do not press that proposal——Certainly not.

1085. You only put that before us, in case we are determined to have a scheme of some kind, as the least harmful?—Of some kind.

1086. Now I come back to the question of values. We have dealt with the values of ships. Would there be the same difficulties in ascertaining the values of cargoes?—Yes, I think there would be.

1087. In spite of your having access to shipping documents?—I do not know that you would always have access to the documents, would you?

1088. You might demand their production as a condition of payment, might you not?—Yes, I suppose you would, but it would be rather a complicated matter.

1089. They are always accessible, are not they?—Yes, they would be accessible, but do not you think it leaves the door open to fraud a great deal there?

1090. Yes; but again I ask you what protects the underwriter against fraud? Nothing but his general knowledge of the business?—His general knowledge would protect him, naturally, but then you see we must have our declarations made. Soon after the vessel has sailed, or before the vessel has sailed, the bills of lading are sent forward to the merchant on this side. But that would not necessarily be the case in time of war.

1091. But do you ever dispute the value on a bill of lading?—The value would be on the invoice. We have very often disputed the value when we have suspected fraud, but if we do not suspect fraud we do not open the question of value. Having once admitted it, we cannot reopen the question of value very well unless we suspect fraud.

1092. In any cases which you speak of where you have disputed the value, you have disputed the value at the time the insurance was offered to you?—No, we have no opportunity of doing that. It is only when the claims are put forward and the documents handed in. Then, if we have any idea that there is fraud, we can reopen the value, otherwise we cannot reopen the value.

Mr. R. B. Lemon.

5 Mar. 1907.

1093. The proportion of cases where you reopen would be very small?—Quite small, yes.

1094. Generally speaking, the values declared would be rather above the actual values, would not they?—Yes, they would be generally about 10 per cent. over the actual values. Generally it is invoice cost, freight, and 10 per cent. just to cover the expenses.

1095. Speaking generally, you settle claims on marine policies with very little difficulty, do not you?—Yes, I should say generally we do.

1096. They are very complicated documents?—Yes, sometimes they are very complicated.

1097. Complicated by a great many varying interests?—Yes.

1098. But in practice those difficulties resolve themselves for the most part without litigation or dispute?—Yes, generally. We have a regular man to settle our claims, a regular claim settler. All the companies have.

1099. May I take it, therefore, that to an expert the business is really a fairly simple one?—Well, there are so many complications in it that it is never extremely simple. A man who knows exactly his business, I should say, makes it fairly simple. At the same time there are always questions arising, and there is no monotony about it. There is a tremendous lot of variety. We never have the same sort of claim presented twice running, I should think. There is always some difference. We have to deal with so many different commodities.

1100. Is the market for war risks a large one?—Yes.

1101. Of course, in case the British Empire were engaged in war, the amount to be insured would be tremendous?—Yes, enormous.

1102. Could the market take that amount?—I should say it would cripple a great many. If we had a war like that, of course, it is something awful to contemplate.

1103. Would not there be a great number of ships that would have to go uninsured, because the people willing to take those risks had their books full?—I could not say that. The market is so very peculiar. If the men once get hit over the war risks they close their books up at once. If they got abnormally hit, they might very likely take no more war risks.

1104. You would not like to say definitely then that there would be no difficulty in a shipowner getting himself covered for war risks?—If there was a long war I should not like to say there would be no difficulty in it.

1105. I suppose we may take it that the probabilities are that the heaviest losses would come in the early weeks of the war. It would, therefore, be most important to the shipowner to insure in those early weeks?—Yes. I do not know why the heaviest losses should come in the earliest weeks.

1106. I assume we shall not have established as perfect control over the sea as we may hope to do later. That is one reason. Another reason would be that a good deal of shipping might be already on its way, to which we could not convey the information that the Admiralty would give to vessels that had not already sailed?—Quite so, but is not it the general rule among nations that they give the ships an opportunity to get into port after a declaration of war?

1107. I think it is, but not always?—I thought that was rather the rule.

1108. I think witnesses have given us instances to the contrary. But even apart from sailings which had commenced before the date of the war, do not you think it is reasonable to anticipate that the heaviest captures would be in the early weeks?—Perhaps it might be, because, under those circumstances, men would not know the danger they were running. That is the only reason I conceive they would be more.

1109. Suppose war broke out this month, would you think it would be possible to cover the war risks of the whole British mercantile marine without the aid of the State?—Yes, I should think it would; certainly at first, anyhow.

Mr. R. B. Lemon.

5 Mar. 1907.

1110. Even in cases where there were very big individual risks. I have in mind such a case as one of the great Cunarders, for instance, where the amount at stake in the one ship would be something gigantic?—Yes; of course, there would be a very considerable difficulty in covering an enormous value like that, because the value of those vessels is a million and a quarter to start with.

1111. More, I think?—A million and a quarter I think was the contract price.

1112. That company, for instance, insures itself for marine risks?—No; the Cunard insures everything.

1113. There is no difficulty in their getting marine risks covered?—No, no. They have got their marine risks, I believe, done entirely. It is a mistake to suppose that they run anything; they do not. These vessels are subsidised by Government, and I believe the only way they were able to build those vessels was by getting Government aid, the Government accepting a small amount of interest—a matter of 3 per cent., I think. Of course, that is a very exceptional thing. You have hit upon a case there which is very exceptional. I do not suppose there would be more than half a dozen such cases.

1114. Turning to the suggestions made as to the people who should be entitled to claim the indemnity, both in Scheme A and Scheme B, I think it is suggested that that should be confined to the owner of any ship registered in the United Kingdom. Have you any observation on that?—With regard to the vessels registered in the Colonies, do you mean?

1115. Yes?—I cannot help thinking that if any scheme of this sort were propounded I do not see why the Colonies should not participate. There are not very many of their ships.

1116. They might, on the other hand, have their own schemes, or join with the British Government in the guarantee; but the interest, whatever it is, of the United Kingdom is not as direct in the Colonial vessels as in the vessels registered here?—They have very few, I think. There are not so many.

1117. You feel that there are not sufficient to be worth excluding?—I should not think so.

1118. Have you anything to say as regards the owner of the cargo? In the scheme it is suggested that it should be the owner of any cargo liable to capture carried in such ship?—The owner of the cargo, I presume, would be an Englishman, would not he?

1119. Yes. Neutral goods would not be liable to capture, not being contraband?—That is what they say in the Declaration of Paris, but they have been captured.

1120. But always on the ground that they were contraband?—Possibly on the ground that they were contraband, but they found out their mistake afterwards.

1121. Just look at Paragraph 8 in your *précis*, will you? You suggest that you must provide for a particular case with neutrals?—The shipments of neutrals, not being liable to capture under the enemy flag unless contraband, would be restored to them if the captured vessel were taken into an enemy's port and condemned, but that would not be an indemnity for loss of market. You see, if they are taken into port and condemned they are waiting in that port for a very considerable time, and meanwhile the owner of the goods would probably lose his market. But you could not indemnify him against that.

1122. What happens under the ordinary marine policy in such a case as that?—We do not guarantee loss of market at all.

1123. Then there would be no reason for the State to guarantee it, would there?—No, I should think not.

1124. That is a risk which the owner of the goods takes?—Yes.

1125. Against which he does not insure?—Against which he does not insure.

1126. In regard to the alternate Scheme B, of a national guarantee upon payment of a premium, I think you have already indicated your opinion that it would be impossible to fix in advance a premium for all classes of ships?—I should say so distinctly. I think that is one of the greatest reasons against the State taking on the insurance.

1127. That, in fact, any premium which you might fix would of necessity be at once too high for the fast ships and too low for the slow?—Yes, distinctly too low. There is a great deal of difference between the two risks, as one can well imagine. It would never do to fix an all-round premium.

1128. Is there much of the trade now carried on in sailing vessels?—Very little now in comparison.

1129. That is almost entirely a trade round Cape Horn and to Australia?—Yes, round Cape Horn to the west coast of South America. To the Californian ports they also still carry cargoes of grain, because there they have to use the vessels as a sort of warehouse, and they do not want the grain to arrive all at once. Therefore they put it into a ship which is likely to take four or five months on the voyage. But, practically, sailing ships are quite a dying trade.

1130. Practically we need not consider them?—I should think there is no object in considering sailing ships at all; the trade is quite worn out.

1131. (*Sir George Murray.*) Would not most of your objections to a scheme of indemnity be met if all the claims were referred to a small board of experts whose decision was final?—I should say, if you get the right class of men, certainly.

1132. Would there be really very much difficulty in a small board of the right class of men arriving at a pretty accurate idea of the value both of ship and cargo?—No, I am not prepared to say there would be much difficulty about that.

1133. Would not that meet the greater part of your objections to the scheme?—I do not think there would be any objection to that, I must say, but it does not meet the great objection that I have to the scheme.

1134. What is that?—The great objection I have would be to putting all men on an equal footing.

1135. But that is a matter which a board of competent experts would take into account, is it not?—You cannot very well do that after the loss of a vessel.

1136. The only importance of it is in arriving at the true value, is it not?—You are talking about the value now?

1137. Yes?—These men could easily arrive at a value, and a proper value.

1138. I mean we are not interested in what you have described as the moral character of the claimant except as affects the amount of his claim?—Yes. Then I suppose he would have to submit to the dictum of these men, whatever they say.

1139. But would they find much more difficulty in coming to a decision than an underwriter does now?—No, I am not prepared to say that.

1140. (*Sir George Clarke.*) I think you said you considered that no one can judge war risks with any approximation to certainty?—I said it was very difficult to judge war risks, because we have not had very much experience. The experience of any man is distinctly limited, and when we tried to judge them a little while ago we made a serious mess of it.

1141. You pointed out to us that the risk was not only dependent on the nature of the claim, but it also depended on the speed of the ship and the character of the owner. So that you regard the underwriter as an expert in those kind of questions, and particularly as to the character and stability of the owner, but you do not regard him as an expert in judging the measure of war risks?—I think it is open to any man to judge of the measure of war risks. I do not suppose I could judge a war risk any better than you could.

1142. You told us, I think, you expected a great increase of barratry in a war in which we were involved on a large scale?—No, I do not think I said that.

1143. I rather gathered you did expect a great increase?—I do not think I said I expected a great increase.

1144. I think you said something about the opportunities of war being so great and special that they would be sure to be taken advantage of?—By an unprincipled shipowner, you mean?

1145. Yes?—Of course that naturally would be the case. If you got an unprincipled owner he would naturally insure his vessel for as high a value as he could, and then send her into the most hazardous trade.

1146. But that sort of performance would arise just as much whether the State took the risk or the underwriter?—But the underwriter would have a better

opportunity of finding out. I dare say that pretty well every underwriter has a sort of black list of his own.

1147. In the case you mentioned in which the ship is taken as a prize and then lost by sea-peril, would not that be clearly a case of a war loss, the sea-peril being posterior to the capture, and therefore being caused indirectly by the capture. There would be no doubt in such a case as that, would there?—I think there might be a doubt. If she is taken as a prize, and is subsequently lost by sea-peril, I think there might be a doubt as to which policy that would come under.

1148. Is a war risk policy taken out now generally all inclusive?—Yes.

1149. In insuring a cargo to Vladivostock was the maritime risk covered at all, or was it all involved in one policy?—You mean now?

1150. During the war?—Sometimes they were taken out free of capture with one set of underwriters, and then the war risk was insured separately. But in the majority of cases I fancy the cargoes were insured, including the war risk, all under one policy.

1151. I think you told us that not many firms write war risks now, and therefore there may be a real risk that in case of war, with enormous demands thrown on the insurance market, there would be nobody ready to undertake them all?—No, I do not think I said that. I did not say there were many firms not willing to write war risks, because the war-risk market just now is a very large one. But what I said was that if single underwriters got very much hit when a war broke out they would be very apt to close their books and not write any more.

1152. And if the early risks proved to be very serious, and the proportion of losses large, the probability is that the majority of ships would be uninsurable after that?—The probability is that the market would contract.

1153. It would mean that the market would contract?—Yes, it would be a very difficult thing to get everything insured.

1154. You told us there were some neutral ships which had to pay 30 per cent. Might not the premium on belligerent ships, the whole of the cargoes being liable to capture, rise to much more than 30 per cent.?—That would only be in a case of absolute contraband.

1155. No, I am supposing we were at war. British ships with British cargoes in them would be liable to capture. There would be no question of contraband. They would be liable to be seized?—If Britain is at war then the neutral goods in those British ships would not be liable to be confiscated, according to the Declaration of Paris.

1156. But I am assuming a case in which we are belligerents, in which a wholly-owned British ship and a wholly-owned British cargo are captured. That is fair capture, and the risk the underwriter or the Government takes is the risk of that whole amount, whatever it is?—But it is not a fair capture unless it is contraband of war.

1157. Oh, yes. That is a point I do not think you are quite clear about. Enemy's goods in enemy's bottoms?—Yes, I quite understand now. Of course that would be a fair capture enough. There is no doubt about that.

1158. So that if a rate is demanded of some 30 per cent. in the case of neutrals, where there is some little doubt in their favour, rates might rise above 30 per cent. in the case of British ships?—With regard to cargoes in neutral bottoms I do not think it would be 30 per cent.

1159. Then you think these rates for colliers were special?—They were distinctly special.

1160. Supposing there were a system of purchased guarantee on a percentage of the values, would underwriters generally be prepared to act as agents for the Government in issuing such policies on commission?—That I do not know at all. I have not consulted my colleagues with regard to this. If the State has got to take up this matter it is simply a suggestion that might possibly commend itself. I am only speaking for myself entirely.

1161. If there were any system of that kind, any sum to be paid for the purchased indemnity, of course the value of the ship would have to be assessed first before the thing was issued?—It certainly should be.

1162. In that case would the same system which is adopted for maritime risks now be sufficiently trustworthy?—I should think so.

1163. You think that what is now adopted for maritime risks is generally a fair assessment, and it approximates closely to real values?—Yes. I dare say it is somewhat an undervalue, but still, I think it is a fair estimate, and if an underwriter accepts a risk he generally looks at the value. That is one of the distinctive features of the risk.

1164. It is an assessment which the Government might accept as a fair estimate of the value of the cargo in issuing a purchased indemnity?—True, but if the Government is not going to undertake this risk for the first few years it would not be a fair assessment of the value of the vessel, because that vessel is deteriorating every year.

1165. Would it be a reasonable thing for the Government to demand, before issuing a purchased indemnity policy, that the ship was insured with a reputable marine insurance company?—Yes, I should think so.

1166. If that were done you could fix the value for the Government?—Certainly.

1167. Any difficulty on that score would then disappear?—Yes.

1168. I gather you do not expect any great disturbance of trade resulting from high insurance rates in the first few months?—Yes. I certainly think there might be quite a serious disturbance.

1169. Then you would admit that if it is possible for panic or a great disturbance of British trade to arise in the first few weeks of war, any system which might tend to avert that risk would be of advantage to the country at large?—Yes.

1170. You think that would be an advantage?—I think it would.

1171. I gather your main objection to any State system is that the risks would be unequally distributed. That offends the principles on which you have acted all your life, and that seems improper to you?—Not only would they be unequally distributed, but I think it would be distinctly unfair to put all men on the same footing and all steamers on the same footing, too.

1172. But looking at it from the broad national view, if it was not a business at all, if the State did not care about losing a certain amount, and did not want to make any money, looking at it simply from the national point of view, you think it might operate as a means of checking panic arising out of war insurance rates at the outset of war?—Do you mean to say in consideration of the limited market which might occur?

1173. No, in consideration solely of the fact that the shipowner and the cargo owner then know that there is a certain maximum which they have got to pay, and no more, to get indemnity?—Yes, that might suit them very well. I dare say it would.

1174. Then what would happen would be in all probability that the State premiums for purchased indemnities would hold for the first few months of war, and then the underwriters would come in again when the rates began to fall, and the State insurance system would quietly die?—Of course I cannot say. So much would depend upon the conditions. So much would depend upon what has taken place in the first few months of the war.

1175. As the Navy began to assert itself, and as the risks to an enemy's ships at sea became greater, so would our risks at sea become less, and so we should hope to come down to the normal, and then be able to drop the system?—You mean in the case of the partial annihilation of an enemy's fleet?

1176. Yes?—Then naturally the premiums would come down, but an underwriter would take into consideration the whole time.

1177. I gather on the whole you rather think it would be advisable that something should be done to check the possibility of panic at the outset of war?—No. I think the shipowners and the merchants can take care of themselves very well indeed. They have got a market to insure them against this sort of thing, and I do not think there is any reason for the State to step in at all.

1178. But assuming war broke out to-morrow, with all the immense number of ships that might want to be covered, would there be anybody to take them up.

Mr. R. B. Lemon.

5 Mar. 1907.

Just think of the enormous amount?—It would be an enormous thing; but I think they would manage it at first. But, as I say, if many ships were lost, there is great possibility of the market becoming limited.

1179. So that from that point of view any State system which was reasonable would be a gain?—From that point of view certainly, if the market is to become limited; but I do not say the market would become limited. It is only in the event of serious captures taking place in the commencement of the war.

1180. (*Mr. Beauchamp.*) With regard to the moral hazard to which you have alluded, if the shipowner were only paid the actual value of his ship there would be no inducement to him unduly to hazard her, would there?—The only inducement would be for a man to get rid of his ship if he wanted to get rid of it. That is what I mean by the moral hazard. A man might be anxious to sell an old worn-out vessel which he finds he cannot sell, and therefore he puts her into a hazardous trade, and tries to get rid of her by insurance.

1181. But if it was limited to the true value of a ship there would be no inducement?—The true value of a worn-out vessel, as you know, is very, very small, £2 or £3 a ton; but a man can very readily insure his boat for £6 or £7 a ton. If he gets an insurance of that description possibly it would not be unreasonable, although the actual selling price of the steamer is so very much less. It might not be unreasonable to insure a man for £6 a ton, and then he would get rid of his vessel to the State in that way.

1182. I am not looking at the question of paid insurance, but the question of indemnity. If there were indemnity without payment the shipowner would only be able to obtain the actual value of his ship?—Yes; but how are you to ascertain the actual value of that ship? That is the only thing. At a forced sale that ship would be worth nothing.

1183. We are told it would not be difficult after the loss to ascertain the actual value of the ship?—No, I do not think it would; but when you put a question to me like that I naturally look at the forced sale of a vessel. If a man put his ship on the market to sell he probably would not get more than £3 a ton. Any expert would be quite justified in putting on a vessel like that, in a money-earning capacity, a value of £5 a ton.

1184. But in this particular case I am looking at it on the question of indemnity; the man will not know beforehand what value he is going to get. It would only be that after the loss he would get what was considered to be a fair value for his ship?—Then in that case, I think, the moral hazard is a very great one, because the man who wants to get rid of his ship would feel that if the vessel cannot carry out its charter it is no use to him, and he would sooner sell it to the Government or to the underwriter.

1185-6. I do not think you quite follow. He would only get the actual value, and would not know beforehand the value which would be put upon it, and therefore he would not unduly hazard or risk his ship?—I think a man who is not very scrupulous would very probably want to get rid of his ship if he got a fair value for it.

1187. (*Chairman.*) Your real difficulty is, is it not, that you are unable to attach a definite meaning to "the actual value of the ship"?—That is so. It is the most difficult thing in the world. If you have a forced sale you never know what a ship is going to fetch.

1188. And yet its real and true value to its owner at a given time may be very much more than he could sell it for in the market on that same day?—Certainly.

1189. (*Mr. Beauchamp.*) Then you think that at the outbreak of war, before any captures have taken place perhaps, the rates of insurance would be fairly high, supposing we were at war with a great maritime nation?—Yes, I should think they would be.

1190. Have you thought out at all what the premiums might be on different voyages when we were at war with different nations? For instance, supposing we were at war with France, what would you consider would be a fair premium from an underwriter's point of view from the Black Sea to this country, passing right through the Mediterranean?—I think that would be a very serious risk indeed, because then you get the whole of the French Navy probably concentrated in the Mediterranean, watching the Straits of Gibraltar for the ships to come through. I think that would be a most serious risk. I should say there you certainly would have to pay quite 25 to 30 per cent., unless you knew for a fact that the French fleet was elsewhere engaged. Of course, it is very difficult to say what premium should be charged when you do not know any of the conditions or any of the circumstances, I do not see how a man can.

1191. No, but we have been told by other witnesses that the premium would not be high?—I think on a voyage of that description the premium certainly would be high.

1192. Supposing we were at war with the United States, do you think that the premium on a British vessel from Canada would be high?—The United States has not got such a very big navy. I do not think the premium would be so high there. Besides, it is a very much wider scope, it is a bigger area; you have more chance of escaping there.

1193. Could you give us any idea of what you think the premiums might be?—I should say the premium there would probably range from 8 to 10 per cent.

1194. And similarly if we were at war with Germany what do you think would be the premium on vessels coming across the Atlantic, especially if we knew that two or three of their very fast vessels happened to be in the Atlantic at that particular moment?—The premium there would certainly be 10 per cent.

1195. (*Chairman.*) Would it be an equal 10 per cent. for both ship and cargo?—Oh, yes, I think so. I do not think there would be any discrimination made between the ship and the cargo.

1196. Therefore it would be 10 per cent. for the voyage?—10 per cent. on the voyage; but, of course, it is very difficult to say.

SEVENTH DAY.

Tuesday, 12th March 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Mr. H. LLEWELLYN SMITH, C.B.
Captain C. L. OTTLEY, R.N., M.V.O.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. ARTHUR LINDLEY.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. RAYMOND BECK, called and examined.

Mr. R. Beck.
12 Mar. 1907.

Mr. Beck, in a preliminary memorandum,* had submitted:—

(1) That, owing to the restricted nature of the market for war risks, it is desirable that, in time of war, the State should undertake to make good to shipowners and cargo-owners the losses incurred through capture.

(2) That even a few captures in the early days of war would raise premiums to such an extent as to cripple commerce.

(3) That any scheme for the issue by a State Bureau of policies of insurance at a fixed or varying premium would be unworkable.

(4) That, although compensation should be allowed, it should, if possible, be accompanied by levies from ship and cargo-owners.

(5) That all vessels taking advantage of the indemnity should be subject to Government orders as regards detention and routes and abandonment of voyage.

(6) That values should be determined according to the conditions laid down in Scheme A, Sec. IV., Sub-secs. (a) and (b).

(7) That the scheme of indemnity should come into operation simultaneously with the outbreak of war.

1197. (*Chairman.*) You are, I think, an underwriter?—I am.

1198. A member of Lloyd's?—Yes.

1199. Have you formed any opinion on the desirability of a State indemnity for risks of merchant shipping in time of war?—Yes, I have.

1200. Would you tell the Committee what it is?—I have formed the opinion that a State indemnity is very desirable, and is preferable to the other scheme which you mention in your schedule, of insurance. I do not know whether you wish me to go into the point as to whether it should be coupled with payment or not.

1201. We will come to that later. To begin with, perhaps you would tell me why you think a scheme desirable?—I am of opinion that in the event of the outbreak of war the present market for insurance of vessels and cargoes against war risks would shrink up. I am of opinion that prior to war, in the case of rumours or anything of that sort, there is a very large market, but after an outbreak, and in the probable event of captures, which I have reason to think would take place immediately, that market would almost entirely shrink up, and the few underwriters or companies engaged in the business would put the rates up to an absolutely prohibitive amount for the carrying on of commerce. The only way I can see to avoid such a catastrophe as that, would be for the commercial world to know that there was an indemnity which would come into force automatically with the outbreak of war.

1202. At the present time the market for war risks is a small one, is it not?—No, it is large now. In time of peace, or comparative peace, it is unlimited.

1203. But when a war breaks out, even a war in which we are not engaged, the number of underwriters who will take war risks is comparatively restricted is it not? It was so in the Russo-Japanese War, for instance?—It was not restricted until a certain zone was located, as hazardous. Outside that zone it was unlimited, but when it came to the pressure point of dealing with the hazardous zone, the market shrivelled up very quickly.

1204. That was a zone in which the risks were very great indeed?—They became during the course of the war hazardous. I should say on that point that until the captures were made the market was fairly large for it. The underwriters took the view that it was just possible there would not be any captures. But the moment they were face to face with the imminent danger of serious loss the larger number cut the risk out of their books.

1205. Was that condition of things comparable to what you can suppose in the case of our being at war with a great naval power?—Yes.

1206. I put it to you that the zone of which you speak was really a very limited zone?—Very.

1207. Through which ships were bound to pass to a very limited number of ports?—That is so.

1208. And that that makes a wide distinction between the circumstances of that time and the circumstances that would arise if we were at war, with our large coastline and our many channels of communication?—You mean, Sir, that it would be possible for this nation to exist, ignoring the claims of shipowners and cargo owners for protection?

1209. I was looking at it rather from the point of view of an underwriter, and what I was suggesting was that in the Russo-Japanese War practically all the risks were bad risks, because there was only one channel of approach to Russian ports. They were blockaded ports, and there was very little chance of the ships getting through. We cannot conceive of the same state of things being repeated in a war in which we were engaged. It might apply to ships coming from the Baltic, but it could not apply generally to all the commerce?—Not to all the commerce, but could not it apply to exactly the parts you name? For instance, would it not be possible that in the event of a sudden war, which I imagine you contemplate, if for instance the North Sea was temporarily held by a foreign power, we should then have many millions at stake in the Baltic. I am speaking of underwriters and shipowners, and my opinion is that from that moment the war risks on that portion would become certainly uncoverable at Lloyd's, except at enormous prices. The underwriters

* *Vide* note, p. iii.

Mr. R. Beck. 12 Mar. 1907.

would be face to face with at any rate a very severe hazard of enormous loss. They could not engage in any further liability. If I might say so, you perhaps think of restricting that entirely to the Baltic, I think it is possible on an outbreak of war the enemy might be in a position to temporarily seize the routes from Australia.

1210. Through the Mediterranean?—No, more in respect to the sailing ships. It is just possible that a small fleet of vessels might start from Swakopmunde and attack a route where there is a continuous trail of steamers. The fact of one or two captures there at the beginning of the war would entirely shrink the ordinary market for war risks. I only name that port as one.

1211. So that your view is that the market in war time would be altogether unable to deal with the volume of risks that would be offered to it?—It would, unless you eliminate the routes, or portions of routes, which from time to time become hazardous. If this Commission said, "We shall be dealing then with a national affair, and all we want is to get food into the country, and let the shipowner and the cargo owner go rip," we could deal with it, because I never for one moment anticipate the fact that there will not be many routes open in which the ordinary rates of insurance, owing to convoys of your fleet, would be, I put it, ½ per cent.

1212. But in the kind of cases you mention you think it would rise to 20 or 30 guineas?—Yes, I do.

1213. And it would be difficult to find underwriters to take the risk at that rate?—You could not place sufficient even at those rates. There would be only a few groups who would go into it.

1214. Assuming there is to be such a scheme, we have to consider whether it should be a free indemnity or whether it should take the form of a purchased indemnity or insurance. Will you give us your views on that alternative?—I think I may dismiss from my mind the possibility of purchased insurance, for two reasons: firstly, that you could only begin to sell insurance after the outbreak of war, which would be too late; and, secondly, that when you were offering, through a bureau which might be opened in various places, to sell insurance, it would come to this—that when, we will say, the adequate premium for the risk was anywhere between an eighth and a quarter per cent., Lloyd's and the insurance companies would be taking it under, and it would be only when those risks became worth two, three, 10, or 20 guineas per cent. that the man would go to your bureau and buy it for an eighth or a quarter.

1215. I gather that you do not think it is impossible to impose something in the nature of a registration tax on shipping which would accumulate a fund for dealing with these war risks?—I think that is more a question for the shipowner. I am afraid as an underwriter I could not give an opinion on that.

1216. If the State fixed a premium in war, varying with the risk, the difficulty you have just mentioned would not arise, would it?—I think it would be very difficult for the State to employ underwriters for them to gauge the risk from time to time. I think it would be almost impossible. I think you may take it that the Lloyd's underwriters and the companies are most excellent judges of a risk.

1217. Even of a war risk?—Yes, even of a war risk.

1218. They have very little to guide them in what that war risk is, have they?—Very little; but I think I would submit that their opinion would come out extraordinarily right. It came out extraordinarily right in the Japanese War.

1219. In the long run?—In the long run. In fact, all the way through I should say that the risk was exactly sized up by the underwriters. The unexpected happened, and they turned out losers instead of winners, but the chances were accurately gauged. I am speaking of when the risks rose from ½ per cent. to 30 guineas.

1220. What you mean is that 30 guineas accurately represented the risk in the new circumstances?—Yes, accurately.

1221. But they were wrong in starting at a half per cent., or at a very low figure?—No, they were quite right there, because rates were only moved as conditions changed. That was the point. If I might give an instance, in the early part of the war colliers were insured at half per cent. from this country to Japan. Several were stopped in the Red Sea by Russian vessels, and let on. The underwriters, who had been informed from authorities and books about the rules of warfare, said, "Oh! of course they let them on; they had no port to take them to," and we continued for a time to write those. But as the war got more acute, and Russia became very much pressed and very much down, she did not wait to comply with these charming restrictions which were made by Law Lords; she sank the vessel first and went on. So these premiums were accurate, because in the first instance Russia did follow out the written law of nations, and when she found she could not take the steamer into a port she said, "We cannot sink it; we must let it go." Three colliers were stopped in the Red Sea in the early part of the war, and were released. In the latter part of the war, if the same vessels were sighted they were sunk. The conditions changed, and the underwriters appreciated the change in the conditions sufficiently to change the premium.

1222. Therefore, in your opinion, nothing in the nature of issue of a policy of insurance by the State is possible? Would that exclude all forms of contribution by the shipowner?—No. I should like to put that more on to the other scheme of indemnity coupled with payment, which I fancy you have got there.

1223. Yes. Perhaps you might take that point now. Would you explain to us your idea of the form which a contribution from the shipowner is to take?—I should like to see inaugurated a system of indemnity by the State which would come into working automatically with the outbreak of war with any nation. It must be, of course, coupled with absolute restrictions as to what the shipowner does with his vessel if he is going to take advantage of it; he would have to come and register under your scheme. As regards all vessels homeward bound, which is the most important point in my opinion, I see no reason why every vessel safely convoyed into port—*i.e.*, every vessel that has passed through a hazardous zone under Admiralty orders, or has deviated *viâ* a route patrolled by our fleet or in British control, should not contribute a tax of one per cent. on hull and cargo. It would be absolutely no hardship on the shipowner. Freights would have gone up naturally with the greater difficulties of business, and one per cent. on the ship would be nothing as compared to his extra freight. One per cent. on a cargo of grain or meat would, in my opinion, not exceed the ordinary wastage that goes on in time of peace and prosperity.

1224. You speak of that payment being made in return for convoy. I suppose we must contemplate that under present conditions convoying in the old sense would probably not exist?—I should have said that the vessel must be registered and have complied with the conditions. It might be a voyage which required no convoy, but the shipowner would have to comply with those conditions, and having arrived in the port of London or Liverpool, having complied with the conditions, then a duty would be taken from him.

1225. Would you compel a shipowner to pay that tax and take that indemnity?—No, I should not.

1226. It would be an option?—An option.

1227. Then, *pro tanto*, the difficulty you spoke of just now would still exist. Where the rate in the market was less than one per cent., the shipowner would not take advantage of the Government scheme, but would go to the underwriter?—For that purpose he would.

1228. So that the underwriter would have the best of the business and the Government would have the worst of the risks?—I would not say that there should not be from the outbreak of war some tax. When I alluded to a half per cent., it was a rate which I put on for having engaged on a route on which there was some special convoy.

1229. (*Sir George Murray.*) Would the shipowner declare beforehand or afterwards?—I think he must declare beforehand.

1230. (*Chairman.*) You think he must give notice of each voyage?—Yes. You are, of course, aware—I do not know whether this is irrelevant, you will stop me if it is so—that the loss which occurred to underwriters in the war we have just had was owing to the shipowner insisting, so to speak, on proceeding with the voyage, almost persisting in capture, if I may put it so. That, in my opinion, should be the one main thing

guarded against by the State under any form of insurance or indemnity. Government must have the right to even insist on the abandonment of the voyage.

1231. It would not be, therefore, an absolute indemnity, or a universal indemnity, which the State would give under your scheme; it would be an indemnity for certain voyages only, perhaps for the bulk of the voyages, but excluding certain voyages which the State would consider too risky to be undertaken?—Yes. After a time it might be that the State would say to the shipowner, "We will not indemnify you if you load your ship to go there. That portion is temporarily in the hands of the enemy."

1232. It might possibly be the case that at the outbreak of war the State might say, We will insure no ship through the Mediterranean. Have you contemplated a possibility like that?—I have, but I want to be quite clear that on the outbreak of war every shipowner has the right to come and be insured.

1233. How do you reconcile that unqualified right on the part of the shipowner with the security which you think it necessary for the State to take against having ships thrown away on certain losses?—Because I think that the State must so far protect the shipowner as that if his vessel happens to be in a hazardous zone at the time, for the good of commerce, you must see him through. But if, for instance, he was on a voyage to the Mediterranean, and was going across the Atlantic, where at the moment you knew there was a dangerous zone, you should stop him at Gibraltar. But you must not deny him an indemnity because he happened to be on that voyage. From the moment you take him over he has to come under your advice.

1234. That means that in your opinion it is essential that the State should cover the risks of voyages begun before the outbreak of war, whatever they are?—Whatever they are, yes.

1235. But you would be prepared to see the State thereafter, in regard to new voyages, refuse any indemnity—I take this only as an illustration—to a ship going to the Mediterranean?—Yes, temporarily.

1236. Possibly for some weeks, possible even for a month or two?—If the Mediterranean was in the same position as the Japan Sea, patrolled by the enemy, if such a thing was possible, I should say that the State ought not to give guarantee to a shipowner who would bring his old vessels out of dock and ship them away to the Mediterranean for the purpose more or less of being captured.

1237. You are no doubt aware that in the old wars, in the great French war for instance, there were a good many British ships captured with the goodwill of the owners. It was in fact, I think, a method of trading with the Continent in spite of the Berlin Decrees and the Orders in Council. Do you think the power of the State Department charged to make regulations forbidding particular voyages, would be sufficient to protect the State against fraud of that kind?—I think it would go a very long way. I could not say whether it would absolutely stop the practice. They are very cunning.

1238. It has been suggested to us, by one witness at any rate, that a shipowner never makes such a good venture as when he loses his ship?—That is so.

1239. Will not the temptation to him to lose his ship be even greater when he pays practically no premium for it?—No, because the indemnity which I should suggest the State should offer is purely for the arrived market value of his ship, whereas when he goes to individual underwriters he is able to insure for any value he likes. If I may say so, that was a lesson learned by the underwriters in the late war, that they did not sufficiently look into the fact that if a man had a ship valued at £20,000 they would insure it for £30,000. I need hardly say it was a better market in the hands of the Japanese than at Vladivostock waiting for cargo.

1240. You would fix the value at the value of the ship and cargo arrived at its port of destination?—Yes.

1241. That would include the ship's profit, therefore?—Yes, the freight and cargo.

1242. Which might be very high, I suppose, in time of war?—Yes.

1243. How would you estimate that value if there had been a loss?—Mr. Lindley could tell you that. It is quite possible to ascertain value in all cases of accident. I should suggest the same methods would hold good.

1244. In ordinary cases that question does not arise, does it, because you take the policy value and you do not dispute it?—Yes, but that question crops up in an enormous number of cases in what we call general average; if the vessel is not totally lost it is necessary for the purpose of adjusting the claim to ascertain those values, and they appear to be arrived at equitably.

1245. Do you yourself know how they are arrived at?—No, I do not know how they are arrived at. We leave the question to the average adjusters. In the cases I am speaking of we have put before us for the settlement of the claim the value of the ship and the freight and the cargo, and those are what are called arrived market values. The underwriters, or the claim settlers of the companies are very shrewd in at once detecting if there is any discrepancy. I feel sure the State could employ a similar bureau which could arrive sufficiently near to the value.

1246. Do you have in those cases to settle the value of the ship and the cargo independently of the declared value in the policy?—Yes, it is altogether different. Perhaps I could put it more clearly by saying that the value of those vessels would still be made up if there was no insurance of any sort. For the purposes of the shipowner dealing with his cargo owner in the event of a vessel on which neither hull nor cargo was insured, these values would have to be made up.

1247. And in your experience that does not lead you to much litigation or dispute?—No, none practically.

1248. Would it surprise you to hear that we have had evidence from underwriters and others urging that it is impossible for the State to find any satisfactory method of arriving at values?—It would.

1249. You see no reason for that conclusion?—No, none.

1250. Either in regard to the ship or the cargo?—Either in regard to the ship or the cargo.

1251. You have had before you, I think, the Schemes A and B that we have put out as a basis?—Yes.

1252. Would the definition of values given under Paragraph 4 of Scheme A, the value of the ship at the time of capture and the value of the cargo at the destination, be the values which you think ought to be paid?—They would.

1253. In regard to cargo, you observe that that would not give the owner of the cargo his expected profits. It would give him his out-of-pocket loss, but not his profits?—Quite so.

1254. From something you said earlier I thought you held that he ought to have his profit too?—The cargo owner?

1255. Yes. You spoke of the value delivered at its destination. I thought you meant that to include the profit on the sale of it?—I did not mean that. I meant the value exactly as written here on B and under Scheme A.

1256. You have already told us that the scheme of indemnity must come into operation immediately on the outbreak of war?—I wish to make that my strongest point.

1257. And to cover all ventures begun at that time?—Yes, quite.

1258. I suppose you would go further and say that it must also cover the return home of ships in foreign ports at that time. Take a particular case. Suppose we were at war with a Mediterranean Power, and that there were ships loading in the Black Sea, it might be a very hazardous risk for them to come home through the Mediterranean. What would you do with those ships loaded but not actually started at the outbreak of war?—I have not sufficiently had my attention drawn to that point. We are speaking rather hastily, but I should think that that would be a matter of the State paying for detention, but certainly not promising indemnity to the owner if he put to sea in the face of the enemy.

1259. Do you contemplate the State giving a guarantee against detention or demurrage as well as against loss?—Yes, I should.

1260. Is that a risk habitually insured against in

Mr. R. Beck. 12 Mar. 1907.

Lloyd's policies?—It is only insured against under the war risk, I think. The ordinary policy, which is free of capture, seizure and detention, does not pay demurrage, but we should pay if the risk were included in that under the word "detention."

1261. (*Mr. Lindley.*) Demurrage is never paid?—But does not demurrage become detention in time of war?

1262. No, that means detention of the ship?—Then I should like to withdraw that as regards the word demurrage. I thought the word detention in time of war would include demurrage. I should say in answer to your first question that the owner should be compensated for being obliged to leave his vessel in a port. I do not know what the proper word for that would be.

1263. (*Chairman.*) You mean obliged in the sense of his being directed by the Admiralty to do so?—Because he is directed by the State, to whom he is looking for indemnity.

1264. That would make a very large extension of the State's risk, would it not?—I think it would.

1265. Have you formed any idea of what the risks of the State might be in a great European naval war?—I am afraid not. It is absolutely impossible to arrive at it.

1266. Is there anything you could add that would be useful to us from your experience in regard to the lessons that underwriters have derived from the Russo-Japanese war?—I should like to suggest in the first instance that the principal lesson we learnt was that all possibilities or probabilities based upon the past were absolutely fallacious. They led us astray. After all we have read and been told by experts of the small amount of harm done by the "Alabama," which was held up as the great test case of a vessel preying on commerce, I beg to suggest that in my opinion no captures would be made in the future by a vessel of that sort. They would be made only by a war vessel of some sort, kept in absolute wireless communication with the mainland. No vessels would put to sea to roam about where they might not ever come across a vessel at all. They would be only placed in positions where they would be in wireless communication with either their battleship or their base on the mainland. They would be actually informed when to come home, and when to come out, and where vessels were, with the result that instead of searching the seas without seeing a sail owing to ill-fortune they would simply net in everything. That is the principal lesson for underwriters, in my opinion. Secondly, there is the matter which we have already touched upon, the certainty that the capture by the enemy would be looked upon as a very useful market by shipowners, and must be guarded against.

1267. Must be guarded against by restricting the indemnity to the value of the ship without any profit?—Yes, quite so. There would be plenty of profit for the shipowners out of their vessels which bring in successful voyages, for them not to feel hardly used when on one they only get the absolute market value.

1268. Would you be inclined as a further check to give them something less than the value, the value less, say, 5 or 10 per cent.?—I did think of that, but I rather fear it would check enterprise, which we want to encourage. We want everybody to do all they can to carry, and I think that would rather check it.

1269. There is another point I would like to put to you. Take our grain trade for instance. At the present time a very large proportion of the cargoes coming into this country are foreign owned?—Quite.

1270. They are foreign owned up to the moment of landing, I think. Have you considered what the effect of a State indemnity would be upon that trade? Would it not result in those cargoes being transferred to British ownership at their port of loading instead of remaining under foreign ownership until they came to their port of landing?—I think it would.

1271. That under international law would render them liable to seizure?—Yes.

1272. They would not be liable to seizure if the trade was carried on in its peace conditions?—That is so. We should have to face that. I take it the object you have in view is to check in no way, say, in the grain trade, the amount of grain that is shipped.

1273. I will put a particular case as an example. Suppose an American owner shipped wheat to Liverpool in a British bottom, and it was seized by a vessel of the country with which we were at war. It ought to be released, according to the principles of international law. Under present circumstances you might assume that the American owner would put his Government in motion to assert his rights and recover his property. If we had an indemnity of this kind would it not be much simpler for both him and the American Government to come against our indemnity rather than to go against the wrongdoer?—I do not think for one moment any American shipper would ship on the pure chance of getting it out of the wrongdoer. The eventual getting it back from the wrongdoer has proved to be a very doubtful procedure.

1274. In any war that we can conceive of ourselves being engaged in, the rate of insurance on American-owned corn from America to this country would be very small, would it not?—If we had command of the North Atlantic.

1275. Even if there were the possibility that some enemy's cruisers were trying to destroy commerce, that would be still a risk insurable at a very small rate, would it not?—I should think somewhere around 1 per cent.

1276. But why would not the American continue to ship under those circumstances? A 1 per cent. rate of insurance would not frighten him, would it?—You mean that he would insure?

1277. Yes?—If he could insure he would. It would not interfere with his trade at all. But I thought we were assuming that his only chance of getting it back if he took it himself was out of the enemy.

1278. That was not quite my meaning. Whether he himself had the benefit of his recourse against the wrongdoer, or whether that was transferred to the underwriter, was immaterial for my point. I assumed he would insure. But my suggestion was that it would be much better for him to recoup himself by the indemnity—that is, by selling the corn to a British subject on the other side of the Atlantic, that he would make the sale on the other side of the Atlantic, the British subject would take the risk, and therefore under an indemnity the State would take the risk. It might become good capture then, whereas had it remained in American ownership it would have been bad capture?—I am afraid I do not quite follow you there, because I cannot see under what possible circumstances it can be bad capture for a neutral State to ship grain to us. It would become contraband of war at once.

1279. It ought not to be?—But it would.

1280. Unless it were being sent to feed troops or to victual a fortress?—How could you decide whether it is going to feed the army or the populace?

1281. Do you not think that the interests of American producers might cause, for instance, the Government of the United States to take a rather strong line on that point?—My idea is that they would continue to ship as long as they could insure at a reasonable rate, and that would be outside the bounds of this Commission altogether; it would be American property coming here. But if the state of affairs got so acute that he could not get his own insurance, it would be very much the best thing for him to be able to transfer it to Britishers, who would get the State indemnity. I think that is what we want to arrive at. We want to encourage foreigners to ship as long as they can, but to have this indemnity ready at the moment when, owing to terrible losses to underwriters in other respects, it is possible that the whole insurance world might be wiped out. I hope they will not be.

1282. You clearly contemplate that the State should give its guarantee for both ship and cargo?—Yes, clearly.

1283. All forms of cargo, or necessities only? Have you considered whether any distinction should be made?—I had thought of it, but I was unable to arrive at any line I could draw between what would be necessities and the reverse. I think that would be a detail which should be considered. I have not any strong views on it. I did think of it, but I could not arrive at a point where you could draw the line.

1284. (*Sir George Murray.*) How far would you regard it as essential to the working of a scheme of

indemnity that the shipowner should give previous notice of his intention to avail himself of it?—Unless he gave previous notice I do not see how it would be possible to keep him under the directions of the admiralty. For instance, if no notice was necessary, the vessel might sail through the Mediterranean, and if she got through nothing would happen, but if she were captured, he then cannot come and say, "I want indemnity." He has done the very thing we want to avoid.

1285. But you might have a system of issuing general notices, which the shipping community would read and pay attention to, without their actually announcing that they were coming under the scheme?—You could have it, but I see no objection to their coming under the scheme.

1286. The difficulty I see is that I suppose, if they gave notice, that would be accepted in some form or other, or do you contemplate a simple notice addressed to the Government Department at home?—That is what I should suggest—a notice that they wished to come under the scheme, which would imply that in the event of any one of their vessels being on the verge of a zone that has become hazardous during the course of a war, they would have to stop. They could not proceed into the enemy's mouth, and be captured and get indemnity.

1287. Would they do anything more than give notice? Would you insist upon any particulars of the value of the ship or the value of the cargo?—I do not think it would be necessary.

1288. Because you see no difficulty, when the claim arises, in settling the value of the ship and cargo?—No; I do not see how you would always please the shipowner, but I see no difficulty in arriving at an equitable value.

1289. How would you deal with vessels in foreign ports at the time of the outbreak of war, or on the sea?—In port at the time? Not on a charter?

1290. Either in port or on a voyage?—Those which were on a voyage I should say certainly must be seen home.

1291. You mean they would get an indemnity without giving notice?—I presume that this scheme would be well circulated among all shipowners as soon as it was complete, and that it would be their duty at the moment of the outbreak of war to send in their vessels. They could perfectly well do that. You mean the first news might be the sinking of a ship?

1292. Yes?—I think that would have to be provided for. The war might be begun, and I should think it is very probable, by a raid on merchant vessels.

1293. There would be many cases of ships on long voyages, three or four weeks, perhaps, from home?—Quite so.

1294. And those you would bring under the scheme without any notice at all?—Yes, I would bring home everything at sea.

1295. (*Sir George Clarke.*) I think you advocate a State system, and you regard that State system as essential?—I do.

1296. To keep our commerce going in time of war?—I do—absolutely essential.

1297. And you think the scheme, whatever it should be, must come into force on the outbreak of war?—I do.

1298. I gather that you think that if it did not come in disturbance would arise when it became evident that war was imminent?—Yes; it would prevent that. The knowledge that the scheme was afloat would prevent the constant panics.

1299. If there were any uncertainty as to the period in which the State system came into force, that would be injurious to shipping?—Yes.

1300. Do you know whether, at the time of the Fashoda incident, war risks were very heavily insured?—I have reason to think they were very heavily insured, but I had no personal interest in it at that time. I cannot give evidence on that point.

1301. But it is probable they were?—Yes; and very largely, no doubt.

1302. I think you rather advocate that the shipowner and cargo-owner should pay something, but you do not advocate the State going in for insurance in any form?—No. I see such great difficulties as regards any form of insurance. Therefore I put this scheme on one side in favour of the indemnity, and the indemnity, if possible, to be coupled with payment.

1303. You think, as a principle, the indemnity should be purchased or paid for in some way?—Yes, I do.

1304. Supposing that the State did not go in for insurance business in any form, but merely fixed a schedule of rates, varying in different zones, that would not be insurance from your point of view, but it would be insurance from another point of view. There would be no variation, but a fixed schedule of rates to operate right through the course of the war. Do you see any objection to that?—I am thinking that is getting very near insurance.

1305. No; because insurance, as you explained to us, varies according to the news you receive, and may go up and down every day. It is a fixed schedule. You know before war breaks out what it will be, and it remains in force throughout the war. The difference seems to me to be vital?—I cannot for the moment see upon what possible basis such different rates could be fixed, because it is only the course of the war which relieves one portion and makes it a half-a-crown risk, and the next week or the next day it is a 30-guinea one.

1306. But the State is not to make money out of it, and only hopes to get a fair return. It is not a business for the State?—I should be of opinion that that was not a good method of getting payment.

1307. Why do you think so?—Because I think the rates fixed for various voyages or zones at the commencement of war become unreasonable.

1308. That would not be the point, you see. The State is only doing this in order to get rid of the grave dangers which you foresee. The State is therefore performing a beneficent operation, for which it wants to get some return, but which it does not expect to get necessarily entirely covered?—I should not be in favour of that method.

1309. Supposing an indemnity of that kind were in force, do you think underwriters would act as agents for the Government, on commission?—I do not think that would be a good scheme. No, I do not think they would.

1310. You contemplate, I think, that all British ships and all British cargoes should be entitled to any advantage which the State gave, whether they traded between British ports or between neutral ports?—Certainly.

1311. I think you told us that ordinary insurance ships and cargoes are sometimes insured above their real value?—Yes.

1312. Is there any difference of treatment between ships and cargoes in that respect?—I should say our experience would teach us it applies more to the hulls of vessels as against the cargoes. It is always perfectly easy to arrive at what the value of the cargo is. The invoices of purchase can be secured, and the various documents, and the exact value, with a reasonable profit, ascertained. But the value of the hull is a more difficult question to arrive at.

1313. But the underwriter can know generally if the values have been overstated?—Yes; if he gave sufficient attention to the point he could arrive at it.

1314. Supposing there were any system of purchased indemnity given by the State, could the State take the values of the marine insurance of the ship and cargo as sufficiently satisfactory for the basis of the purchased insurance?—No, I should say not.

1315. They would be too big?—They might be too big.

1316. It would not then be a fair standard of value?—In my opinion, not.

1317. I suppose policies of insurance are used invariably as securities for raising money?—Invariably.

1318. Therefore, whether there was purchased indemnity or free indemnity, there would have to be some document or something pass between the Government and the ship and cargo owner which the ship and cargo owner could use with his banker?—Yes, I should think so.

1319. So that the mere announcement in the Gazette that from a certain date free State indemnity would come into force would not suffice?—I do not think so.

Mr. R. Beck.

12 Mar. 1907.

1320. There would have to be a document in which values were stated and laid down?—I should think so.

1321. Supposing there were a system of payment at fixed rates, which I have suggested, there would be no difficulty, I suppose, in getting quotations at Lloyd's for any zone in which Lloyd's could do it under the Government fixed rate?—No, I think there would be no difficulty in that.

1322. So that even under that system a considerable amount of natural market insurance would go on?—Yes. It would of course be necessary before the State paid to bring in, as is the custom with ordinary insurance, that there was no further insurance. The question would be the same with any marine loss. It is necessary to find out whether there is what we call a double insurance. It would, of course, have to be provided against that the shipowner got his arrived value of the ship out of the State, and had in his pocket £10,000 on the hull from somewhere else.

1323. Then, after a time, as the war progressed, if it progressed in our favour, and as rates dropped below the State fixed schedule, the underwriters would come in and gradually absorb the whole of the remaining business of the war?—On that basis.

1324. And if there were a system of purchased indemnity, as I have just roughly indicated, that would tend to keep down the prices in the open insurance market a little?—Yes, I should think so. Of course, this depends entirely on what rates you did fix for the zone.

1325. Certainly. If there were no State system, but if the State did undertake to issue directions for the guidance of shipping generally, would the underwriters who took war risks stipulate that all ships which they insured followed the directions given by the State?—I think they would make use of it.

1326. Would they make that a condition of obtaining the policy?—It is difficult to say what they would do, but it would be probable that they would take advantage of that.

1327. Supposing it was known that a system of Admiralty directions would be adopted in war, would that also enter into the terms of the arrangement made for insurance of war risks in peace time?—I should think it would have an effect on rates.

1328. And on the conditions which you lay down?—Certainly.

1329. If you were insuring to-day for an imaginary war, and if you knew it had been laid down that the Admiralty would give through the war such instructions as they could, would you make it a condition on your policy that, supposing war broke out, the ships would have to follow the instructions given by the Admiralty?—I am afraid that in times of peace, having regard to the competition for the business, the underwriters would still continue to take low premiums without any conditions of that sort.

1330. Is there much business done in war insurance in normal times of peace?—On cargoes?

1331. On anything—ships or cargoes?—So far as I know it is confined to very few trades. The only one where for some reason the insurance against war is habitual is on the cargoes of nitrates from the west coast of South America, where almost invariably, in addition to the marine risks, a premium for war is included, and the cargo is covered on that basis.

1332. But at such rates that of course they cannot be fixed on any principle?—In all short voyages of cargoes no premium is charged at the present moment. But from the west coast of South America the premium is 1s. 3d. per cent.

1333. That is not really insurance on scientific principles; it is really betting against a particular kind of war?—No, it is insurance on the most scientific principle.

1334. I think you pointed out that future "Alabamas" would act in a different way, and would have greatly extended advantages—that they would be in communication by wireless telegraphy with their own ships, and therefore would be more effective as against trade in war time?—That is my humble opinion as a layman.

1335. Would not that advantage also tell in the direction of the warships protecting commerce, and in the direction of the ships themselves who were trying to avoid capture? Would not all those advantages tell equally on the other side?—It would certainly assist in keeping open routes, but I do not think it would affect the zones in which at the time vessels would be liable to capture by the enemy. They would be in portions of the sea of which for the moment we had lost control, in my opinion.

1336. Broadly speaking, the improvement of means of maritime communication by wireless telegraphy must tell most in favour of the people who have got the most warships?—I think it would.

1337. (*Sir James Mackay.*) Do you think the State might charge 1 per cent. for the risk that they covered?—Without having any data before me to arrive at an amount to be absolutely accurate, I am of opinion that we could fairly charge 1 per cent.

1338. That would cover the risk for the voyage, would it?—Yes, on every vessel that arrived there.

1339. Arrived safely in this country?—Yes.

1340. Would you apply that to short voyages as well as long voyages?—It might be advisable to differentiate in some way for very short voyages.

1341. On a voyage from Japan home, for instance, would you charge the same rate, one per cent., as on a voyage across to Hamburg?—No. When I said one per cent., I rather put it that I would not give more than that.

1342. As a maximum?—As a maximum. I alluded to that because on all the evidence which I have had the opportunity of hearing, the rate has been put down at something like an eighth per cent. as being sufficient, and I wish to give my evidence that I consider that that rate would be quite inadequate to provide sufficient funds in any way to recoup the State what they would have to pay.

1343. Of course, in an ordinary insurance policy, if an owner pays on £100,000, and the ship is lost, the underwriter gets the premium on the £100,000, and the underwriter pays the £100,000. In the case of the State, if the shipowner pays one per cent on £100,000 he pays £1,000. Would you recommend that the State would pay that £100,000 or pay the actual value of the ship?—I did not quite follow you. Is the actual value of the ship £100,000?

1344. The owner says so. He pays a premium on the £100,000?—With Lloyd's?

1345. No, with the Government?—He only pays his premium to the Government on the arrived market value of his ship.

1346. Suppose she has never arrived?—Then there is no premium paid. I do not propose that any premium should be charged on those vessels which the Admiralty have failed to bring home.

1347. Which do not arrive?—Which do not arrive. I propose that the State should pay for those. The owner has done his best to bring in the food.

1348. Then a vessel that is lost pays nothing?—No; but if the vessel comes in and is able to earn a successful freight, which in my opinion would be high in time of war, I think the Government should deduct this tax for safe convoying.

1349. Then the owner would pay one per cent. on the value of the ship?—Certainly.

1350. In that case he would try to make the value as low as possible?—He would.

1351. In the case of general average which you were speaking of, it is to the interest of the shipowner as well as the cargo owner to minimise the value?—Yes, of each.

1352. So that there is not the same difficulty there. The shipowner puts his ship in at as low a value as possible, and the other side tries to raise the values?—Exactly; so that in each case there are the two interests, and they appear to arrive at a very satisfactory mean.

1353. You spoke of some colliers being stopped in the Red Sea on the way out to the Far East?—Yes.

1354. And they were released. They were stopped by the Russians, and released?—Yes.

1355. Do you know whether they were bound for Japan or Hong Kong?—I do not know. I do not know about their papers.

1356. (*Mr. Beauchamp.*) With regard to the charge which you think ought to be made to procure the Government indemnity, it has not to be paid for

those vessels which are lost, and do not arrive?—That is what I suggest.

1357. And only on the vessels which do arrive, and therefore this would have to be paid after the arrival of the vessel?—Yes.

1358. Do you not think that that would necessitate an enormous amount of work for assessing the value of each ship and each cargo after its arrival?—I do not think it would require any more work than the State arriving at the value at which to take the insurance of the vessel paying the premium before sailing.

1359. Quite so. That no doubt would be a very great difficulty, and would not this be an equal difficulty?—They both would be difficulties.

1360. The difficulty, it seems to me, would be almost insuperable. I am not sure how you are going to get hold of every vessel after it arrives, and the cargo after it arrives, because a large amount of this cargo would be what is called general cargo. There would be different interests in the one ship, and therefore I do not see how you are going to get hold of the owner of a good deal of that cargo after the arrival of the vessel, especially if you had foreign owners?—Yes, but we are not proposing to indemnify them.

1361. Everything liable to capture carried in a British ship?—But surely there is a system of clearance at the docks. Could not that be extended? How do they pay ordinary duties? There must be a system.

1362. Yes, there is a system of paying duty. Still, I think it would be very difficult. There is only a certain amount of duty here, of course, because all things are not taxed at present?—But they are looked at to see whether they are taxable or not, I presume.

1363. But it is getting the value which I think will be so difficult?—Of the cargo?

1364. (*Mr. Lindley.*) The dock charges are imposed on packages and weights, not on values?—But articles which are liable to duty are examined in some way.

1365. (*Mr. Beauchamp.*) Yes; but this would extend all that?—It would extend it.

1366. And it would necessitate an office with a very large staff, I should think?—Without doubt.

1367. To be erected after the outbreak of war?—But I should think any scheme is going to necessitate that.

1368. If you assessed the value simply on those vessels which were captured, it would not necessitate such a large staff, but if you had the whole of the commerce of this country, it would?—You mean that these are objections to making any charge?

1369. Yes?—I quite see that you cannot make a charge, whether in the form of taking a premium of insurance before sailing, or what I would call taking the bonus afterwards, unless you have a staff. You cannot collect anything without a staff. You cannot collect our taxes, you cannot collect duty. For instance, Mr. Lindley says it is only a question of weight, but surely they look to see whether a package contains champagne or not.

1370. But the payment would be based, I suppose, on the value, and in each case you would have to get a certificate of the value of this cargo. That I should think would necessitate a very large staff and very competent supervision. You think that would be a difficulty?—I do think so, but I think it is not insuperable.

1371. Then we have had evidence to say that the market for war insurance would not be greatly restricted in time of war. You do not agree with that view?—I take the exactly opposite view.

1372. And as the premium rose the market would become smaller?—Yes. When I say I take exactly the opposite view, my view is that when the premium is assessed by underwriters at anything from an eighth to a half or one per cent. there would be a very large market, but at any acute stage the market would entirely shrink away in any war in which we were engaged.

1373. Of course, it is very difficult to hazard any view as to what the premium would be on a particular voyage in the event of war, but have you at all thought of that question? Have you in your mind fixed premiums which might be charged in the event of certain wars between this country and another country?—I am of opinion that if we were at war with another strong Power, and it as necessary for us to keep more or less of a patrol across the Atlantic for the purpose of getting grain, the rate on that would range from a half to one per cent., because there are so many incidentals in connection with a war. It is not only the actual capture of a vessel that has to be paid for.

1374. You do not think it would be more than a half to one per cent.?—Not on a patrolled route.

1375. If we were at war with Germany, for instance?—Yes. I should say the rates across the Atlantic, as long as we had command of the North Atlantic, would still be from a half to one per cent.

1376. But supposing we were at war with the United States of America, what do you think the premium on grain coming from Canada would be?—It would entirely depend upon whether our war vessels could keep a line. If that end of the Atlantic was in the hands of the American fleet the rate would be about 70 guineas I should think.

1377. Then you think that an underwriter, although he has not had very much experience of war risks, is better able to assess the value of a particular risk than anybody else?—I do think so.

1378. You said that, with regard to the Russo-Japanese war, the underwriters would have been all right in fixing the premium that they did but for an unforeseen event. What was that?—The unusual blocking of La Perouse Straits by ice.

1379. And also the unexpected fall of Port Arthur, I suppose, so soon as it occurred?—I think that underwriters knew that that would fall sooner or later, and I think the premium of 30 guineas was meant to cover that whenever it occurred. But at the same time the premium was based on the vessels bound for Vladivostock being able to pass through La Perouse Straits.

1380. If Port Arthur had held out for another month the underwriters would have netted sufficient premiums to have paid for any possible losses of vessels on that route afterwards?—They would, but I think they would have incurred further liability. They would have had more premiums in hand, but they would have gone on incurring further liability, so that I doubt whether they would have come out winners.

1381. Then there was one question that was asked you about the value of the cargo at the port of shipment plus insurance and freight to port of destination, and that no profit should be paid?—I am afraid I have been under a misapprehension. I should have read that word port of arrival. I misread that.

1382. Not at the port of shipment?—No.

1383. Because at the port of shipment a man might make a profit?—Yes; I am afraid I read that carelessly. I shall have to correct that.

1384. (*Chairman.*) The port of arrival would include insurance and freight, of course?—Yes.

1385. (*Mr. Lindley.*) And profit?—Yes.

1386. (*Mr. Beauchamp.*) And if there was some scheme of indemnity of this kind then the American shipper of whom we have spoken would have no hesitation in shipping in a British vessel?—No.

1387. That would remove any difficulty on that score?—It would.

1388. (*Mr. Lindley.*) Throughout your remarks you have referred a good deal to the question of convoy?—Yes.

1389. Suppose no convoy existed, suppose the Admiralty simply gave instructions with regard to date, route, and navigation generally, and avoided the question of convoy, would that make any difference in your opinion with regard to the question of premiums or rate to be charged, if any were charged?—Are you speaking of my suggestion of an indemnity?

1390. Yes, with regard to your 1 per cent.?—No, I should still stick to my 1 per cent. If they chose to save money over not convoying, they could spend it in making good the captures.

1391. You rather put it that the saving of expense to the State in not convoying would go towards increasing the indemnity?—Yes.

1392. Have you read Section 3 in Scheme A, and in Scheme B?—Yes.

1393. Do you think that the control referred to with

Mr. E. Beck. 12 Mar. 1907.

regard to the Admiralty there is sufficient?—Under which section, may I ask?

1394. Scheme A, Section 3, page 4. Do you consider that the notification to the Department and the control mentioned by the Admiralty here would be sufficient?—No.

1395. Do you wish for a further control?—I wish to specially put in the right to insist on the abandonment of the voyage at a given point.

1396. I was going to suggest the words "date of sailing" there would deal with that question, provided the voyage had not already commenced?—But I am speaking of when the aspect is changed during the course of the voyage, that it should be possible to prevent vessels for instance entering the Mediterranean after it is known that that is a hopeless spot.

1397. There was another point referred to as to the transference of the cargo to a British subject. In your experience have you had any difficulty in ascertaining where the property of a neutral or an alien has passed to a British subject? I mean you have had many cases of transfer of cargoes *en route*. Have you ever had any trouble in finding out where that transfer has taken place?—I have never had any experience.

1398. I thought you might have come across some of those cases where the sale of cargo takes place *en route*?—It does, but it has never led to any difficulty. For instance, in the nitrate business it occurs in almost every shipment.

1399. Would there be any difficulty in tracing those sales?—None whatever.

1400. So that if the transfer did take place it would be easily ascertainable whether the goods were at the time of capture the property of the British subject or that of the neutral?—Yes, subject to fraud.

1401. Of course, that we have all got to guard against?—There would be no difficulty otherwise.

1402. There was another suggestion as to the form of policy for hypothecation. Supposing the ordinary notice were given under Scheme A, do you consider a policy would be required? A notice once being given, would not the ship and cargo be automatically covered?—It would be automatically covered, but the question which was raised was whether that would satisfy the bankers.

1403. Exactly, and that is what is in my mind. Supposing the bankers knew that the property was the property of a British subject, would they not be equally aware of the fact that it was automatically covered once the notice ws given?—Yes; of course you are raising another difficulty, and that is, from the banker's point of view, what is going to happen to him if the shipowner, having taken advantage of this indemnity, disobeys instructions.

1404. That is referred to in Section 4. Look at "N.B." in Section 4?—Quite. It is not dealt with there.

1405. It is rather left for consideration, is it not?—Quite; it requires consideration, I think.

1406. If that were granted, would it or would it not remove any difficulty with regard to the banker's question?—It would remove it.

1407. You think it would?—Yes.

1408. I take it you lay a good deal of stress upon the position which the bankers take up with regard to mercantile work throughout the world?—Entirely. Commerce is entirely in their hands.

1409. So that it really is a great point, in whatever scheme may possibly be adopted, to see that the bankers are properly protected?—A necessary point.

1410. Supposing the notice to the Admiralty, or rather to the Government Department, were given, the mere acknowledgment to the shipowner would be sufficient then to show that that notice had been given?—I should think so.

1411. That would take the form of any policy that would be required, would it not?—Yes.

1412. You said just now that you objected to any additional insurance over and above the values which are supposed to be covered by the Government under this scheme?—I did.

1413. Why?—Because it would open the door to our experience in the last war, of vessels going on a venture, not so much with the idea of arriving and carrying the commerce to their port of destination, but of falling into the enemy's hands, and getting either the underwriters' or the State's money.

1414. If the underwriter accurately judged the amount of premium necessary to cover the risk, he would take the possibility of that into consideration, would he not?—No doubt a small amount could be done. You mean, would it be possible to insure above the indemnity?

1415. Yes?—Certainly.

1416. That being the case, is there any objection to it?—No objection on the part of the underwriter, but there is an objection on the part of the State.

1417. The objection on the part of the State being to probable fraud?—Quite.

1418. I wanted to gather what your idea was?—That is my idea.

1419. (*Sir Thomas Glen-Coats.*) All the evidence today has been, I think, with regard to ships and cargoes arriving in this country. Would you apply the same principle to ships carrying either minerals or goods to a foreign port?—The difficulty of assessing or collecting the premium in those cases is apparent. I have not arrived at any satisfactory conclusion whether the charge should be made in those cases before shipment or afterwards. But in any case I am in favour of the indemnity being extended to them.

1420. Then you would give the indemnity to foreign ships bringing goods, say wheat, the property of an American owner, to this country. Would you give indemnity either on the ship or on the cargo, or both?—I have not considered that question.

1421. (*Captain Ottley.*) As regards the naval aspect of your evidence, there are some questions I should like to ask. You said, I think, in an early part of your evidence, that the war risks of vessels plying to the Baltic ports would be enormous?—Under certain conditions.

1422. That is what I wanted to make very clear. Of course, the war risks to vessels plying to Baltic ports in the event of a war between ourselves and the United States for instance, would be negligible?—That would not be a hazardous zone.

1423. So that the war risks on any route must vary with the enemy?—Entirely.

1424. There was one very small point with regard to something you said about the danger in the South Atlantic from German vessels plying from Swakopmunde?—Or some other base.

1425. I should like to ask you if you can tell us of any base in the South Atlantic that the German ships could use?—Not at the present moment.

1426. There was a point that Sir George Clarke asked you about with regard to the probabilities of foreign nations at war with this country making large use of wireless telegraphy in order to direct their cruisers?—I feel that that would be largely used by any enemy making captures. I do not lay much stress in the future upon the ordinary privateer which we read of in history going out and doing damage. I do not fancy the damage to our Mercantile Marine is going to be done by that at all.

1427. So that to once more take a concrete case: imagine a French or, better still, a Russian cruiser acting upon the great Atlantic trade routes, either the North or South Atlantic, whence is she going to get her radio-telegraphic information?—I look upon that as a half-crown risk—no risk under those circumstances. But, on the other hand, if we were at war with the United States it would be a 30 guinea rate on ships from Canada, unless we had annihilated their sea power, because they would patrol the mouth of the St. Lawrence by one vessel with wireless communication. They would act exactly as the Japanese did. They were on the wharves at Hong Kong and all our coaling ports in the East, and the Japanese were drawing descriptions of the ships in Cardiff and on the Tyne. They knew exactly what was happening.

1428. As with the bases on which they would act, so also on that question of controlling their ships with wireless telegraphy, circumstances must alter cases?—Absolutely.

1429. There is just one small point about what you

said in favour of indemnity. You said, I think, that you favoured indemnity rather than insurance, but you thought that such indemnity should be coupled with some sort of payment?—If possible.

1430. Then I understood you to suggest that the payment should be made after the arrival of the vessel at the port as a sort of thankoffering. She arrives at the port and pays to the State something by way of thanks. At any rate, it is not paid until she arrives?—Just so.

1431. I should just like to ask whether you think, if payment of that sort is made, it should be made in the form of some collection upon tonnage dues?—Mr. Beauchamp has raised difficulties.

1432. I understood Mr. Beauchamp's questions, but I confess I do not think I quite understood what your view was about that?—My view was that there must be some system of inspection of ships and cargoes on arrival which could be extended to meet this and arrive at values for the payment of a tax before clearance. But I am speaking of a subject of which I have no knowledge. I know nothing about this Customs business except that I know it exists.

1433. If England were at war with France, could you give any sort of outside estimate, any guess at all at what would be likely in the early part of the war to be the rates of war insurance upon British merchant ships plying across the North Atlantic?—I think it is impossible for any one to hazard such an estimate. It would entirely depend upon the position of the French fleet and our fleet.

1434. In the early part of the war, until the great fleet actions had more or less cleared the air, do you think it might be large?—I think the premium depends very much indeed upon how the war is commenced. If the war is commenced by a sudden capture or seizure of merchant vessels, it would create a very great scare in the insurance market, and would scare out the greater number of careful quiet underwriters, and would leave only the more venturous to deal with these questions. That is my opinion. But, if on the outbreak of war the French Fleet were occupied on purely warlike matters, and took no heed of our commerce which arrived, the insurance would be a ready market and the premiums would continue low. It is impossible to foretell what would happen.

1435. Do you think it would be safe to say as much as this, that in such an event as war between England and France, if the premiums on the English ships were a certain amount, the war risk premium on United States ships coming to the United Kingdom would be less?—Yes. I should think so. I think you could safely say that.

1436. Then the British ship would have to pay, in order to insure her war risk, a certain premium, which would be greater than the American ship would pay?—Yes.

1437. That is tantamount to saying, is it not, that the British ship is penalised as a cargo carrier as compared with the American ship?—In time of war?

1438. In time of war?—It is in theory, but I should very much like to qualify my remarks here, because I am suffering from the bitter experience that when war has once been declared every conceivable kind of cargo becomes contraband for the time being. That is what we suffered from in the Japanese War. We paid for vessels which had no contraband on at all, but they were considered contraband. Under those circumstances I think the Americans you are speaking of would be the first to realise that, and they would not ship on the chance of getting it out of another Power, and the premium would be very much the same. It would be a little less, if anything.

1439. (*Mr. Llewellyn Smith.*) I suppose the most critical time is at the outbreak of war and just after?—As an underwriter I fear that most.

1440. And you suggest that all British ships afloat at the time of the outbreak of war should come under the scheme of indemnity whether notice has been given or not?—That is so.

1441. Such ships as got home you would charge 1 per cent. whether they liked it or not. I mean, it would not only be a voluntary payment in case they wished to come under the scheme, but any ship which came in that was at sea at the time of the outbreak of war would be taxed to that extent in our ports?—It would; but that question wants careful answering, because there might be a vessel just outside the port. I am rather of opinion that this tax should only apply to ventures which are commenced after the outbreak of war.

1442. Then it would be free indemnity for vessels that were afloat at the time?—Yes, I think that would be the conclusion which would have to be arrived at.

1443. And with regard to the vessels detained in foreign ports and ordered to remain there because it was unsafe to come away—I mean the vessels which were in foreign ports at the time of the outbreak of war, would you have free payment for the demurrage?—Yes, if they were there at the time.

1444. For any length of time?—No, until notice was given that the route was clear.

1445. And after that this tax of 1 per cent., or whatever it might be, would come into operation?—Yes, for the rest of the war.

1446. (*Chairman.*) I understood in answer to me that you said you would not make the scheme obligatory, but would only impose a tax of 1 per cent. on the vessels which had expressed a desire to have the benefit of the guarantee. I understood you just now to say in reply to Mr. Llewellyn Smith that you would make it obligatory?—I am speaking of the outbreak of war. I thought we were entirely alluding to what occurs on a sudden outbreak of war. There I am of opinion that the commercial world of Britain should know that there is a State indemnity, but that as the war proceeded that would require to be qualified.

1447. That thereafter it would be optional to the shipowner to have the indemnity and pay 1 per cent. if he came safe home, or to go without the indemnity and pay nothing?—I did say that to you, but it leads to ramifications. I am of opinion that some option should be allowed to the shipowner.

1448. (*Mr. Llewellyn Smith.*) Then supposing the Admiralty used its power of ordering the abandonment of a voyage, or stopping at Gibraltar a vessel from going into the Mediterranean, would they pay anything for the loss incurred by their not going further on that route?—Certainly. It would save them paying the whole loss of the vessel going on.

1449. That would be covered by the 1 per cent.?—Yes, or by whatever tax, or toll, or due the Commission would arrive at as being required. I am not of opinion that because at the outbreak of war the Commission agreed to 1 per cent. it should not be altered.

1450. It might be raised or lowered?—It might be raised or lowered.

1451. You do not think it would be sufficient if there was free indemnity for all the vessels employed at the time of the outbreak of war, and then everything was left afterwards to the underwriter?—That would be a very great scheme in itself, but whether it would be complete I should not like to say. I have not considered it; but that would be an immense stride.

1452. And, of course, very simple, comparatively?—Yes.

1453. Did you contemplate that a notice should be given for each ship on each voyage, or that a general notice by a big steamship company that they wished all their ships to come in under the scheme, given once for all, would suffice?—I would say that that would suffice, but there is no doubt that it would be necessary to know where the vessels were. Notice would have to be sent in to say that certain vessels were loading grain from the River Plate, or from North America, or from Canada.

1454. I do not quite understand why that should be necessary. If the vessel was captured on a given date in the prohibited zone, there would be no payment?—Quite. If that is made clear there is no need.

1455. (*Chairman.*) Have you considered the difficulty which might arise from a vessel being lost at sea? How would you apportion whether it had been sunk by a belligerent cruiser or lost through a marine risk?—I would not raise that as a difficulty to any scheme. The occurrence, in my opinion, would be so exceedingly rare that it would be perfectly possible to deal with it on evidence when it arose.

1456. Might you not have evidence that there had been a foreign cruiser somewhere in that neighbourhood, that there was also a bad storm in that neigh-

Mr. R. Beck. 12 Mar. 1907.

bourhood, and no further evidence as to what had become of the ship, which was never heard of again?—I am of opinion that it is unlikely that any first-class Power with which we were at war, however desperate, would sink ship and crew.

1457. You explained to us that in your opinion, if many captures followed the outbreak of war, British shipping would become practically uninsurable?—It would be paralysed.

1458. What would then happen? Would the shipping trade go on without insurance, or do you imagine that the vessels would be laid up?—They would be laid up.

1459. Or transferred to a foreign flag?—Yes.

1460. There was one point as to which I was not quite clear—I think it was in answer to a question of Mr. Beauchamp; it is in regard to the value of the cargo on which you would pay compensation. I think, in answer to Mr. Beauchamp, you said the value at the port of arrival?—That was my idea.

1461. But that would include not merely cost, insurance and freight, but profit also, would it not?—I think I am right in saying it would include ordinary profit.

1462. That is to say, it would put the merchant in as good a position as if his venture had succeeded?—It would, but no better.

1463. You think that is the happy mean?—Yes.

1464. It would not be sufficient to compensate the merchant and the shipowner merely against out-of-pocket loss?—I think it would be better to encourage them to go into this hazardous trade.

1465. (*Sir George Clarke.*) Have you formed any idea of what rate per cent. for a long voyage, say London to Hong Kong, would be so great as to practically cause the voyage not to be undertaken?—By a steamer?

1466. By a steamer. Could you give us any idea about how much would be prohibitive in fact?—The rate would entirely depend upon the position of the enemy's fleet anywhere near the route.

1467. I am not talking about that. I want to know if you can tell us what would be the maximum rate which would produce the stoppage of our shipping; how much, in fact, should shipping stand without being checked or hindered altogether?—Do I understand you to mean how long would there be a free market of insurance?

1468. No; how much could shipping stand in the way of insurance without being brought to a stop and laid up, or sold, or transferred to a neutral?—If the rate from Canada to this country was five guineas, and we could get plenty of grain from the Baltic, and therefore the price of corn in this country was normal, no shipper could afford to pay five guineas for bringing it from Canada. It would stop shipping as far as Canada was concerned.

1469. A rate of anything like 2 per cent. or 2½ per cent. for long voyages would not really be a very heavy burden, considering the freights?—It would absolutely put a stop to it. You are speaking of Japan or China. If the rate was 2 per cent. on our goods owing to circumstances, it is perfectly clear that the Japanese would not buy our goods plus 2 per cent. if they could get all they wanted from America without any war risk. It would stop the trade. My opinion is that a five-shilling rate would stop it. I know that when Bradford spinners were supplying millions of blankets to Japan the contracts depended upon whether the rate was 5s. or 10s. per cent.

1470. And that is equivalent really to saying that unless we do something of this sort British trade cannot be expected to go on in war?—Absolutely. In my opinion there is no question of it.

1471. So that it is vital the State should do something?—Vital.

1472. Your system of the 1 per cent. can only be made to apply to a ship that arrives in this country?—That is so.

1473. Therefore all shippers under the British flag not coming to this country receive all the protection of the British Navy, and also receive the benefits of the indemnity, and cannot make any return for it at all?—That question must be dealt with. My attention was specially called to the keeping up of food supplies to this country in time of war, and it was to that problem of keeping that portion of the commerce of this country going that I directed my attention. As regards the commerce in British ships, between other countries, or the exports, I have not given special attention to it so as to give an opinion how they should be fixed. But I am still of opinion that it should all come under the head of indemnity.

1474. You do admit it would be inequitable merely to penalise ships arriving at ports in the United Kingdom?—Absolutely inequitable.

1475. You think that some other system of getting at the other ships must be fairer?—Yes.

1476. (*Mr. Beauchamp.*) With regard to the question of demurrage, I think you said that if the Admiralty decided to detain a vessel in port and not allow her to leave, they would have to pay something in the form of demurrage?—I am of that opinion.

1477. That is not contemplated by the schemes which we have put forward. The scheme is only to cover the losses by capture, seizure, and detention by the King's enemies?—Yes. May I give reasons for that? My reason for that is this: Take a shipowner who is taking advantage of the indemnity and has a ship in the Mediterranean; it is unfair to him to say, "Keep your ship in port, because it is dangerous there," without giving him some compensation. You know that in the opinion of the Commission or the Bureau that particular part would be extremely hazardous and certain death, therefore you command the shipper to stay in port, and for that detention he should be recompensed.

1478. Then there was a question with regard to that by the Chairman with reference to any difficulty that might arise as to whether the loss occurred from a marine peril or from the destruction of the ship by the enemy. Suppose a ship were posted missing at Lloyd's, the presumption would be that she had been lost by a marine peril, and the Marine Underwriters would have to pay unless they could prove she had been destroyed by the enemy?—Yes, that is the answer to it.

1479. And that is exactly what did happen, I think, with regard to a vessel going to Vladivostock?—Yes.

1480. She was missing, and one of her boats was picked up, but it was not known whether she had been wrecked or had been destroyed by a mine?—Yes.

1481. And the underwriters paid on a marine policy?—Yes.

1482. It was eventually proved the underwriters were correct in having done so, because months afterwards—I think after the war was concluded—the bones of that vessel were discovered on the coast as a wrecked vessel?—Yes.

1483. (*Chairman.*) In that case do you know whether the marine risk had been taken by different underwriters to the war risk?—Yes, it had. May I say one word? I would like to say that the answers which I have given I think I am quite satisfied represent my views, but there is one question upon which I am not quite satisfied, and that is my answer to you as regards whether the shipowner should be allowed to take advantage of the indemnity or not. It is such a very complex problem that I feel I could not without a very long discussion give all the pros and cons. of that. But I am in favour of this, that under certain conditions, although the effort should be to bring every shipowner under the indemnity, there might be cases in which he should be exempted.

1484. If when reading the proof of your evidence through you would like to add anything on that point, perhaps you would do so in the form of a memorandum. Of course, any ordinary corrections you will have the opportunity of making in the proof?—Thank you.

(For memorandum subsequently supplied by Mr. Beck see Appendix.)

EIGHTH DAY.

Tuesday, 19*th March* 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman.*)

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Captain C. L. OTTLEY, R.N., M.V.O.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. SIDNEY ALEXANDER BOULTON, called and examined.

Mr. S. A. Boulton. 19 Mar. 1907.

Mr. Boulton, in a preliminary memorandum*, had submitted:—

(1) That Scheme B is preferable to Scheme A, Clause 3 of Scheme B being necessary to prevent wilful loss by capture.

(2) That a State policy should be given to every British steamshipowner for 12 months, at a premium of 2s. 6d. per cent. Values to be agreed upon between shipowner and Government acting under expert advice. Sailing ships to be excluded.

(3) That it is necessary that food and raw material should be supplied at a reasonable price in times of war.

(4) That in order to prevent panic prices, owing to large war premiums, the State should give a gratuitous indemnity to cargoes of food and raw material. A Committee to be appointed to draw up a schedule defining food stuffs and raw materials, and to deal with values and claims.

(5) Shipowners to insure and pay premiums at once, the income of £200,000 resulting therefrom (2s. 6d. per cent. on 16 million tons of steamships at £10 per ton) to form a fund for contingencies.

1485. (*Chairman.*) I think you are an underwriter?—Yes.

1486. A member of Lloyd's?—Yes.

1487. And you have had a good deal of experience of war insurance?—Yes, unfortunately.

1488. Will you give the Committee some idea of the extent of your experience in war risks?—During the last 10 years, in various war scares that have caused large war insurances to be done, I have paid in losses and claims as much as £150,000, so that my experience has been rather large and rather varied.

1489. It extends to the Spanish-American war as well as to the Russo-Japanese war?—Yes.

1490. You have seen the terms of the reference to this Committee?—Yes.

1491. And you have seen the Schemes A and B?—Yes.

1492. You are, I understand, in favour of a scheme of national guarantee?—Certainly.

1493. But you prefer the model of Scheme B to Scheme A?—A combination of the two, or a selection from the two; not either one or the other. An amalgamation of the two seems to me the most practical and beneficial.

1494. You are in favour of some payment by the shipowner in return for the guarantee which he obtains?—Yes.

1495. Do you intend that payment to be made only in time of war or in time of peace and war?—In peace and war.

1496. Would it be an offer open to the shipowner to accept or refuse, or would you make it compulsory upon shipowners to come under the scheme?—I think that would be a matter for the shipowners. If a large majority of the shipowners were in favour of it I think it ought to be compulsory; but if not, I think only voluntary. Of course, it is all subject to what the shipowners might have to say in the matter. If they disapproved of it altogether, I think that part of the scheme relating to the payment of a premium in peace time would have to be abandoned. You cannot make them pay it. I do not suppose anybody wishes to make them pay it; but it appears to me, as a man of business, that it would be a very favourable offer to them.

1497. Have you formed any idea in your own mind as to what the amount of the premium should be?—Yes, I have fixed upon the price of one-eighth per cent. of the value of the steamer.

1498. You say the value of the steamer. Do you mean to exclude sailing ships?—Yes.

1499. On the ground that they are too bad a risk? They are too bad a risk, and they are not worth paying for. The sooner they are done away with the better it will be for the owners, and the underwriters, and the commercial world in general.

1500. Are not there particular trades which are still almost entirely carried on by sailing ships, for instance, trade between Australia and the West Coast of America?—Not entirely, but very largely at present. But they are being superseded. All the trades which were exclusively in the hands of sailing ships are being cut into by steamers now, and are being superseded by steamers. The trade from the West Coast with nitrate and wheat was very largely carried in sailing ships. Now, I should think, quite as large tonnage comes in steamers.

1501. So that practically you think the steamer is beating the sailing vessel everywhere?—There is no doubt of that.

1502. And the sailing vessels will probably die a natural death?—Yes.

1503. But in the meantime you would not seek to keep it alive by giving it the benefit of the indemnity?—No, I do not think a guarantee against war risks for sailing vessels would be a good move, either as a matter of policy or as a matter of business.

1504. In fixing or suggesting a rate of one-eighth per cent. what has guided you to that particular figure?—I have been guided to some extent by the rate which prevails at the present time, or in normal times, which is charged by those underwriters who take that business. The price at the present moment, with certain restrictions as to trade, is 3s. 4d. per cent. Of course, that covers risks of war not only with this country but between other countries.

1505. Is that 3s. 4d. per cent per annum?—For 12 months. That is the rate now. But in the case of a war scare that rate would go up considerably. In the time of the Penjdeh scare 1 per cent. for 12 months was paid for large fleets or 10s. per cent. for three months, so a shipowner can never depend on having his war risks covered by underwriters at 3s. 4d. or 5s., or any price at all. But if he goes into this arrangement it does not matter what the political state of affairs is; he knows that all he has to pay is one-eighth per cent.

* *Vide* note, p. iii

Mr. S. A. Boulton.

19 Mar. 1907.

1506. Among the witnesses we have had there has been a great conflict of evidence as to whether it would be possible to insure at all the whole of our mercantile marine if we were ourselves engaged in war. Have you formed any opinion upon that?—I have thought of it. It is a matter of imagination more than calculation. It is easy to imagine a state of circumstances in which it would be impossible to insure the whole of the mercantile marine, or, even if people were willing to take it, whether the security offered would be substantial enough to warrant the premium being paid. Of course, it is quite a matter of speculation as to what would happen. Some people have gone so far as to say that in a war which involved a large number of our steamers or vessels being captured the whole of the companies of London would be in the Bankruptcy Court. Statements of that sort have been made, very wild and vague, and uncertain. You cannot tell what would happen. But from my experience in the Vladivostock affair the helplessness of a merchant steamer in time of war was very much impressed upon me.

1507. But the circumstances in that case were very peculiar, were they not? They were peculiar because there was only one narrow line of approach, and the port was practically blockaded from the beginning?—Yes, the field was very restricted, and the facilities for blockading it were very great owing to the position of Japan.

1508. It would be very difficult to argue from that to what would be the situation in case we were at war, with our extended coast line?—Yes. As far as the immediate coast line goes, and the Channel, and so on, I have no doubt the protection would be very great. But considering our shipping is spread all over the world, I think the idea of protection is out of the question. It would be a question whether the enemy could undertake these capturing operations. If they had facilities for doing that, such as a base in the Mediterranean, or one can imagine other spots in the world—the Baltic, for instance—it would be like a flock of sheep with a wolf amongst them—no hope.

1509. Apart from the extent of particular risks, is the market large enough to take the war insurance of the whole of the British mercantile marine?—Do you mean in time of peace?

1510. Let us say in time of peace first of all?—Certainly. Certain companies are apparently willing to take any line up to £50,000 on each steamer in time of peace.

1511. Suppose war seemed imminent, would there be a large market for war risks, do you think?—A very much smaller market than there is in time of peace. There would be a great scare, no doubt. A great many people would go out of the market altogether.

1512. The number of people who will at any time write war risks is very much less than the number who are engaged in writing marine risks?—Very much less. A large majority of underwriters prefer not to underwrite war risks, and they do not write them if they can help it.

1513. Of course, to underwrite our mercantile marine against war risks is a very much larger operation than anything of which you have had experience in either of the countries you have mentioned?—Much larger, of course. We calculate the value at £150,000,000, I think, roughly.

1514. Personally, in suggesting the rate of $\frac{1}{8}$ per cent. payable in peace and war, you do not think that would be too grievous a charge upon shipowners in time of peace?—I should have thought not. A good deal depends upon what the shipowners will have to say; but to anyone who is largely interested in shipping the question of war between this country and another must be one of the elements in their consideration, one of the factors in the value of their property. If that danger is eliminated I think the property would be increased in value, and I should have thought as a business transaction that an offer of a guarantee on the part of the State would be well worth $\frac{1}{8}$ per cent.

1515. I gather that in arriving at the figure of $\frac{1}{8}$ per cent. you have not attempted to fit it particularly to the actual war risks?—No, certainly not.

1516. Have you any conception of what the risk of the State would be likely to be in case of war?—No. I should be very sorry to offer any opinion on that.

1517. It is practically guess work?—Quite.

1518. Past experience, in your opinion, does not give us any useful guide?—No. I do not think it is any good referring to the Napoleonic wars, or anything of that sort.

1519. Will you explain to the Committee on what grounds you prefer a guarantee on payment of this premium rather than a free guarantee?—In the first place I think it is only right that the shipowner should pay for what appears to me to be a great advantage offered to him. In the second place it constitutes a sort of register of value which is settled in time of peace, at leisure, with plenty of time for ascertaining correct values, and so on, which is not altogether an easy matter, but still one that is to be done with the help of experts. That is a sort of register, and when war and commotion and scare arise there is no doubt whatever about the value. I do not think that any scare value, as you might call it, should be taken into account. The steamer might be worth a great deal more in time of war owing to certain circumstances. But I do not think that ought to be taken into account, and certainly a man ought not to be allowed to insure as much as he likes. That is one of the great points, because my experience shows that a certain class of men, when they are very well insured, are absolutely reckless as to what becomes of their property. I do not say that as against shipowners as a body, of course, but there are a number of men (and the thing has actually happened) who, being very well insured, have neglected the most ordinary precaution that they ought to have taken in order to avoid capture.

1520. Capture being a matter of indifference, or perhaps even an advantage to them?—A large advantage.

1521. I take it, therefore, your main object is to arrive at an agreed and fair value in time of peace, when there is no pressure, by which to assess the losses in time of war?—Exactly.

1522. That would involve the State opening an insurance office in time of peace, would it not?—Yes, an office, a branch, I should think, of the Board of Trade. I do not know what department, of course, but I should think the Board of Trade; one man, a secretary or something of that sort, would be sufficient.

1523. They would require highly expert assistance?—Yes, but not constant assistance: I mean to say a reference to the Surveyors of Lloyd's Register—there are a number of men qualified—and men who sell ships.

1524. You think it would not be a difficult thing under those circumstances to fix the value of ships fairly?—I do not think it would be at all.

1525. Some witnesses seemed to think it was an almost impossible task?—I cannot see that. You see, if the shipowner is paying a premium in time of peace, when there is no apparent fear of any claim arising, it will not be his object to increase the value, because it is quite problematical whether a claim will arise—in fact, we all hope that a claim will never arise upon it—and therefore he will not want a fancy price fixed upon his ship; he will be quite satisfied with the fair value. In fact, a good many men perhaps would turn round and say that it was an imposition; that they were not in favour of it.

1526. I gather that you think it would be impossible to fix values fairly after the loss had occurred?—Very much more difficult.

1527. Of course there would be an advantage in one way, that the State would then only have to inquire into the value of the ships actually lost?—Yes, that is so.

1528. It would restrict the amount of work they had to do very much?—Yes, but when the loss had actually taken place the owner of the property would use every effort to increase the value of it, and it would be much more difficult to check it, and would lead to no end of dispute. That is the great point, to avoid dispute. As underwriters we should never allow a value to be fixed after a loss. We should arrange, and we do arrange in certain cases where the value cannot be fixed before the vessel has been some time on her voyage, that the value shall be taken at, say, invoice cost, the freight, and 10 per cent.—a fixed sum. But we should never leave the owner of the property to fix the value after a loss, because we should not only be very often swindled, but we should certainly be having differences, which are best avoided.

1529. In the particular case you take you are speaking of fixing the value of the cargo, not the hull, of course?—No. Of course, the hull is always valued before.

1530. Do you consider that is a fair value to put upon the cargo?—A 10 per cent. profit?

1531. Yes. Might one take that as a general working rule, that that would be fair both to the underwriter and to the owner?—In the case of ship or cargo?

1532. In the case of cargo?—In the case of the cargo I think it is a very general principle.

1533. Now, returning to the case of the ship, is it not possible to find some rule of thumb of the same kind—the cost of the ship less a fixed depreciation?—No, I do not think so. I think some ships depreciate much more rapidly than others.

1534. Take the ordinary case of your being asked to underwrite a particular ship, you do not survey it specially to arrive at its value?—Oh, no. We take a very rough and ready method; in fact, the fixing of the value of a ship is one of the most irregular proceedings in our business. We practically allow the owner to put what value he likes upon it.

1535. I think it has been suggested to us that generally the values are rather large, that they err on the side of generosity?—No, I would not go so far as that. It is rather a technical question. There is a way of insuring a hull now—I do not know whether it is really worth while detaining you upon it—but the practical effect is this: The owner puts a small value upon his steamer, which he insures against all risks at, say, five guineas or six guineas per annum. He puts a value, perhaps not more than three-fourths of its real value. Any claim except total loss is paid upon that policy. For instance, suppose a boat is worth £30,000, he insures for £20,000 at the high rate, and any claim except of total loss is paid on that policy of £20,000. If there is a damage of £10,000, that policy pays the £10,000. The value is really £30,000, and so to cover the total loss he insures £10,000 against total loss at a premium of about 35s. He therefore saves the difference of £10,000, between 35s. and five guineas per cent., and therefore an owner often puts a low value on his steamer, although he is insured for the full value as a matter of fact. But that is a technical matter. I think owners, as a rule, want to insure the full value.

1536. It would not be possible to take, as a rule for arriving at the full value of the ship, the cost, and then such depreciation as is allowed, for instance, for income-tax purposes?—No, I think it would be very complicated and very difficult, and when you had got a state of things such as you can imagine in time of war, when a man wants to get paid at once, leaving his value open would lead to a great deal of difficulty and a great deal of loss of time, and therefore I think to have the value settled in time of peace is an important point. I will tell you one instance. There was an American owner, and as a sea risk his steamer was insured for £20,000. He took up a charter which involved a war risk, and he insured for £35,000. The steamer was captured. She was kept a long time by the Japanese, and finally sold back to the owner. The underwriters paid a loss of £35,000 on it. She was sold back to the American owner for £10,000. So he got £35,000 from the underwriter and the steamer, for which he paid £10,000, or a profit of £25,000. That is the sort of thing one has to contemplate.

1537. And that you would provide against by fixing the value in advance before there was any scare?—Yes.

1538. Do you consider the dangers of that overvaluation so great that unless the values could be fixed beforehand you would be opposed to any scheme by the State?—No, it would not affect me in that way at all. I should not oppose the scheme on that ground, but I think it would be a better scheme the other way.

1539. You do not think that the risk of frauds against the State under any other system would be so great that the State had better not touch it?—No, I would not say that. I would say that if the State had brought before it the possibility of fraud, it would be wise to try and avoid it.

1540. You gave as your other reason for desiring a premium that you thought it was only fair that if the shipowner received this great benefit he should pay something for it?—Yes.

1541. I presume that he would recover that something from other people eventually in his charges?—Oh yes, of course; all these charges are eventually paid by the consumer.

1542. So that the contribution by the shipowner would be more nominal than real?—Yes. In any case it is very small, I think. It might be smaller. I only fix 2s. 6d. as a suggestion.

1543. On what grounds do you argue in favour of the adoption of a scheme of indemnity at all?—On the ground that it would have the effect of steadying prices; that is the first great advantage; and, secondly, it would prevent our business as shipowners from being seriously affected.

1544. You anticipate that without any such scheme rates would fluctuate violently on the outbreak of war?—Yes.

1545. What do you think would then happen. Would ships be laid up?—Yes, that is one of the probabilities. A large number of owners not being able to insure their vessels at a reasonable price would have to lay them up. In the Japanese war the large fleets that trade to this country and to America were laid up entirely. Of course, we cannot argue entirely from things of that sort.

1546. The Japanese fleets?—Those that were not used in transport had to be laid up. There was no line of steamers running between Europe and Japan. It was impossible to run them.

1547. Of course the Japanese at that stage of the war were not in a position to give any naval protection to their vessels in European waters?—No, they never could have been in that position.

1548. On the other hand, their mercantile marine was comparatively a small affair?—Exactly.

1549. And its place could easily be filled by foreign vessels?—Yes, chartering foreign vessels.

1550. But that would hardly be the case if our mercantile marine were largely held up?—No, we should not be able to charter the other vessels. But I do not know that our position would be much stronger in the China seas in time of war than Japan's position was in the Mediterranean.

1551. Do you think there would be much transfer of shipping to a foreign flag?—I am not an expert as to the facility of transferring shipping. I have read a good deal about it, and there seems to be a difference of opinion.

1552. Do I gather that you would confine your indemnity to food and raw materials?—Yes. After thinking over the matter and reading the evidence of the Food Commission, I have come to the conclusion that you could not say that the State was benefiting by indemnifying, for instance, a cargo of raw silk from Japan to Vancouver, which might run into half a million, or something of that sort, and you could not say that it was for the benefit of the starving poor of England that the State had to pay half a million for that.

1553. And therefore your guiding principle would be the protection of the interests of the food supply of the poor, and of the raw materials on which the poor here at home depend for employment?—Exactly.

1554. But not the protection of our trade at large?—No. I should think that would not be warranted. I think the other is certainly warranted as a matter of State policy.

1555. And you would confine the guarantee, therefore, to cargoes coming to this country, and to so much of those cargoes as were of necessity to the people?—Yes.

1556. Would you, then, confine the guarantee to steamers which were engaged in that trade?—No. I think there is a different reason to be put forward in favour of indemnifying the steamers in any trade and every trade.

1557. And what is that reason?—I think that the prosperity of the shipping trade and the conditions of it differ from the general trade of the country. The destruction of a shipping fleet is quite a different matter to a temporary interference with commerce.

1558. You feel that if the mercantile marine were once seriously injured, there would be a great danger that it would never recover?—Never entirely recover.

1559. Whereas the loss of a particular cargo would

Mr. S. A. Boulton.

19 Mar. 1907.

be a comparatively small matter, causing only temporary inconvenience?—Yes. I think a very strong case can be made out for an indemnity for steamers and for food and raw material, but I do not think a strong case can be made out for a general indemnity.

1560. Would you give an indemnity on outward-bound cargoes?—No.

1561. You would indemnify the inward-coming raw material in order that people may not be thrown out of work in this country?—Yes.

1562. But would not the same reason lead you to indemnify the outward-bound cargo of the manufactured produce?—Of course, there are many reasons to be urged in that direction, but I think one has to consider what the country would have to say to a question of this sort, and I think the country might see the policy of indemnifying the one, but they would not be so ready to engage in the much larger undertaking of indemnifying the export.

1563. But the sale of the produce of their labour is quite as important to the working classes here as is the supply of raw material that their labour works on, is it not?—Yes, I suppose it is.

1564. You might cause great distress in Lancashire as easily by closing access to the markets of the East as by cutting off the supplies of raw cotton that were coming in?—Yes, but I do not think you could keep the export trade of this country intact by paying the losses of capture. You might say, on the other hand, you could not ensure the arrival of food supplies by paying for the losses, but to my mind there is a great difference between the two. I do not know whether I can formulate it all at once.

1565. My idea was that you might lose the market for your finished goods owing to scare rates of insurance and scare prices for freight just as easily as you might lose it owing to the high cost of raw material?—Yes. I can see the point, but it does not seem to me the urgency is so great in the one as in the other, because we should not anticipate that a war would last for years, and temporary interruption of commerce is not the same as a temporary interruption of food supplies. The effect would be entirely different. One is a matter of famine prices, starvation, and insurrection possibly—difficulties at all events; the other is a mere matter of tiding over a few months of bad business.

1566. I am not sure that I agree with you. If you carry your mind back to the American Civil War and its effect upon Lancashire, do you think that altogether bears out your view? There was, of course, no stoppage of food supplies then, but there was tremendous distress, was there not?—There was. I have not considered it in that light. Of course, the American Civil war was an unconscionable time getting itself finished, and I do not suppose we should see anything like that in a war between this country and another. Modern war is not carried on as that was—the struggle of armed mobs, as Moltke called it.

1567. Suppose there were a ship freighted partly with raw materials or food supplies, such as you would propose to cover, and partly with articles of luxury, or articles going elsewhere, which you would refuse to cover, would not the risks be spread evenly over the whole cargo in the matter of the charges made to owners?—The owners of the luxuries would nave to pay a premium for the war risk, and he would have to pay a much larger premium, whereas the other man would not have to pay any premium at all.

1568-9. Suppose the result of the high rates on luxuries was that they could not be shipped, then the ship would come home with only half a cargo?—No, she would come home with a full cargo of provisions.

1570. Would you propose to settle a schedule of the articles that would come under the heading of necessities, raw material and food?—Yes, on the principle of having these things all arranged in time of peace.

1571. But the indemnity would in that case also apply only to war risks?—Only to war risks.

1572. I asked you that question because there was a phrase in the *précis* you were good enough to supply me with which I did not quite understand?—Yes, I gathered that was not quite clear. I wrote it in a great hurry. I was telegraphed to supply it at once. But I only mean by war risks risk of loss by the King's enemies, of course, not by others.

1573. You would not consider it necessary to cover loss by detention under Admiralty orders?—No. That is rather a point I would like to enlarge upon. I think the value of this indemnity is not only what I have tried to show, but I think it is in bringing the shipowner under the orders of the Admiralty. I think that might be, perhaps, the most valuable part of the scheme. His indemnity would only stand provided he carried out the Admiralty's orders.

1574. Would not the shipowner be inclined to do that under any circumstances?—If they were well insured I should think a great many would not feel inclined to take not only those precautions, but ordinary precautions; as I have said, not the whole body, but a large number.

1575. Is not there a certain guarantee against cases of that kind in the reluctance of captains and crews to take undue risks?—Yes, that might act in that way, certainly. In the case of the Japanese war that reluctance was not so evident. It meant that they were taken out of a cold climate and shipped home at somebody else's expense.

1576. But in a case in which we were the belligerent the capture of one of our ships would probably be followed by prolonged detention and imprisonment, as prisoners of war, of the captain and crew, I take it?—I do not think the captain and crew of a merchant vessel are prisoners of war. They prefer not to be captured, I daresay. I do not know what the law is, but I do not think they are prisoners of war.

1577. Would they have to be set free at once?—I think they would have to be set free. They would be got rid of as soon as possible.

1578. (*Sir George Murray.*) You are quite clear, are you not, that in a war in which this country was likely to be engaged the insurance on the shipping then afloat could scarcely be covered in London?—Under certain circumstances, such as large captures being effected.

1579. But even before war broke out?—Oh, yes, that could be covered.

1580. Would not the rates be running very high then?—They would be running a good deal higher than in time of peace; but at first they might not run very high.

1581. Could you cover £100,000,000 at 5 per cent., or 6 per cent?—Before war broke out, certainly. I should think so, easily.

1582. In the whole market?—Yes, certainly.

1583. And the difficulty would not arise till the rates went a good deal above that?—No. The difficulty would arise when the losses had to be paid for.

1584. There would be no difficulty in insuring the risk?—No.

1585. It would be in paying the losses?—Underwriters are very optimistic, I think. One does not like to say too much of these things, but, of course, in certain war scares insurance companies have taken lines which to the ordinary mind seem absolutely reckless, when their whole capital and reserves would not pay a percentage of the probable losses.

1586. Then as regards the value on which this 2s. 6d. per annum is to be paid, how often would you revise that in time of peace?—It should be paid annually. It would be in the form of a tax for six months possibly, the 1st of January and the 1st of July.

1587. Then there would be a half-yearly revision of the value. Do you contemplate that?—Yes, or perhaps a yearly revision. I do not know. I have not considered that. Perhaps once a year would be sufficient.

1588. And that would have to be settled between the Government Department and the shipowners?—Yes.

1589. That would be rather a large undertaking, would it not?—No, I do not think it would be a difficult undertaking. It would be done on a principle of writing off depreciation, modified by the value of shipping at the time. A man might argue, and very justly, that his steamer was worth quite as much as it was last year, because although depreciation ought to be written off, the market value of steamers had gone up, or gone down, as the case might be. But I do not think that presents any great difficulty.

1590. (*Sir George Clarke.*) I think you feel very

strongly that it is necessary for us to do something?—Yes, very strongly.

1591. You really think there would be a most serious panic arising out of the inflation of insurance if war broke out as matters now stand?—A great danger.

1592. And you think it is a vital point that some scheme which would prevent that and steady prices should be arrived at, if possible?—Yes.

1593. Do you think the shipowners would pay the 2s. 6d. willingly, that you lay down as the tax in time of peace?—I have not consulted any shipowners on the point. As a matter of fact many shipowners do pay a war risk as it is, and I should think the shareholders in the companies would feel that it was a proper thing to be paid. It is really offering more than the money's worth, because no insurance company would offer to insure a shipowner perpetually, whatever happened, for 2s. 6d. per cent.

1594. Supposing that they did not agree to pay in peace time, would you let them come in just when war seemed imminent, and get the whole advantage of this scheme?—No. That is the crux of the whole scheme. If they did not come in in peace time they would not come in at all.

1595. Then what sort of margin would you give?—They must come in now.

1596. They must come in now, all of them?—Any that wanted to be covered.

1597. And if they do not come in now, no one would get an advantage at all, even if there is not a war for 50 years?—I would not say if they did not come in in a twelve month; but I mean if they did not come in in time of peace. I think they would have to make up their minds, if the offer were made to them, whether they would take it.

1598. At all events you would not admit them if it was obvious that they desired to come in only because they thought the danger of war had arisen?—No. That is the main idea of making a peace premium.

1599. I think you told the Chairman that you did not propose to do anything to help the exporter?—I think it is possible it would be sound for the scheme to include that, but I do not think you would get the scheme carried with that.

1600. On general political grounds?—Yes, on account of the enormous extra cost that it might involve the country in.

1601. If you give the indemnity only to imports, is not there a great temptation to make up bogus cargoes and send them over, if possible, to be captured?—In the first place the shipowner has to come in to make anything of that sort practicable. He has got an indemnity provided he follows the regulations of the Admiralty; and the cargo might be bogus, but the shipowner would have to be a party to the swindle to make any fraud effective. I do not think there is a great danger of that.

1602. Supposing the cargoes to be shipped from America, and to be suddenly sent over here, would not it be exceedingly difficult to have any idea of the real value of these cargoes?—No, I do not think there would be any greater difficulty than is met with now in a marine insurance. It is, as I say, provided for in the contract that the price shall be the invoiced cost, the freight, and 10 per cent. added. The man has to produce his invoices. He has to show what his freight was, and you add 10 per cent. to that, and the value is fixed automatically. That is a matter which is regularly conducted in that way now, and I do not see why the same thing should not apply in time of war.

1603. Of course, the difference is that the one is insurance and the other is indemnity; and under the indemnity, of course, the State only pays for the food and the raw material which it does not get?—Yes. I do not see that it affects the principle of arriving at the value.

1604. Except that if you have got to pay an insurance premium, there is some little restriction arising from the fact that the insurer has to pay for his protection; but there is none in the case of an indemnity—it is all clear gain to the ship and cargo owner?—It is all clear gain in a way, but unless the invoices are forged, there is no difficulty in arriving at that value. In the case of war, of course, the value of the cargo might be much greater than that 10 per cent., but I should not indemnify beyond that. It might be 100 per cent., and very likely it would be, but the man would have no incentive to lose his cargo because he was going to get that paid. He would have every incentive to make it arrive, because he would get his 100 per cent. profit if it arrived, and if it were lost, he would only get his 10 per cent. Therefore, I would not give him the arrived value of the cargo at home.

1605. Would any document have to pass between the cargo owner and the State?—A document before the loss?

1606. Before the loss?—Not before the loss.

1607. Would it simply suffice if the system of indemnity were Gazetted to start from a certain day? Would that be sufficient for all purposes? Would the banker, from whom money might have to be borrowed, lend money on the order in the Gazette?—Of course, he would want his policy of marine insurance.

1608. Marine insurance, yes; but his policy for the cargo?—For the war risk insurance?

1609. For the war risk insurance?—I should think the banker would be satisfied with the State guarantee instead of the policy of insurance.

1610. No paper, then, need pass?—No; he would be aware that this was one of the articles scheduled, and that in case of capture by the King's enemies it would be made good by the State. I should think that would be sufficient for the banker.

1611. Then if no paper passed at all, the value of the cargo would have to be determined after the capture, which might be exceedingly difficult, might it not?—The banker would have the marine policy, would he not? That would be some guide to the value.

1612. In any case the value of the cargo would have to be determined after the capture, which would always be difficult?—Yes. I see no way of avoiding that. I admit it would be much better if it could be avoided, but I do not see the practical possibility of doing it unless you exact a premium, and I do not think that is practicable, or advisable. There are always objections to every scheme. I do not think that is a very great objection.

1613. Do you propose that cargoes should be indemnified when under a neutral flag, or do you propose to confine the advantage solely to the British flag?—In its present state I should confine it to the British flag. In time of war it might be advisable to extend it to neutral flags.

1614. The indemnity does not arise until time of war. It is the indemnity I mean. Would you give that to the neutral cargo, or the cargo carried in a neutral ship?—I should want a little time to consider that. I rather think not.

1615. I suppose anyhow you would extend the principle to Colonial cargoes?—Practically there are no Colonial steamers coming here.

1616. No, but there will be in time, probably. Could you say what is your real objection to the principle of Scheme B, the objection which led you to oppose the dual system?—The difficulty of the State carrying on an insurance business on commercial lines.

1617. But, of course, that is not contemplated in Scheme B at all?—Charging a premium?

1618. Yes, but a fixed premium; not a variable premium fluctuating from day to day, not a premium which it is hoped will recoup everything, but simply a maximum premium sufficient to steady the market generally, that is all?—Yes.

1619. Does not that modify your view at all?—No. It does not meet my appreciation at all. I have discussed that, and read a good deal about it, and I do not approve of it. I do not think it is good.

1620. You do not think it is good, because you do not think it is practicable?—I do not think it is good or practicable. I see no object in the State charging a premium in war time. It would lead to great difficulties.

1621. But you are charging a premium now in your system on ships?—Yes, but that is a premium in peace time. That is not supposed to be a war premium It is a fixed small sum, almost what you might call a registration fee.

1622. Then what is the fundamental objection to a premium being charged for war risks, when war breaks out?—I do not see any object. The State is not going

Mr. S. A. Boulton.

19 Mar. 1907.

to charge an adequate premium, because the premium is the premium of the market. If it is not going to charge a market premium, it would be better not to charge a premium at all. It would be better to indemnify right out.

1623. But you have told us that the market premium is the very thing which will probably prevent our ships running at all?—Yes, I do not want to leave it to the market premium. I think a war is one of the cases where you want to discard the market ideas altogether.

1624. Then if you discard the market ideas, is not that a strong reason for the fixed premium, which is not governed by market ideas at all?—What is the object of the premium? The State is not going to make a business of it. It is not going to make money out of the premium.

1625. It is the same object, of course on another system, as your 2s. 6d. per cent. It is to help the State to recoup itself?—Yes, but it is creating the difficulty of fixing values and all that kind of thing in time of war.

1626. But the values are fixed now in time of peace. I admit it is arbitrary, but still they are fixed, and the point of advantage lies in the fixture of them?—You would have the value of every cargo come into some State Department in time of peace.

1627. Oh, no, merely that a percentage of the value of the cargo and of the ship is fixed in time of peace for a certain route in any war?—That is very unfair.

1628. When you say unfair, surely it would be enormously superior from the point of view of the shipowner to the present arrangement, when, as you have told us, insurance rates may rise to any height?—You say to the shipowner, If you pay this money now in time of peace you will be indemnified in time of war. You say to the cargo owner, If you are shipping food and raw material to this country in time of war, you shall be indemnified, for State reasons.

1629. That is not the scheme at all. You say to the ship and cargo owner, "Now, when war breaks out, you can, if you like, pay so much per cent. on your ship value and your cargo value on certain routes. If you can do better in the open market, you can do it. That payment arranged by the State shall be the maximum that you will, in any case, have to pay." Surely that is not unfair?—Yes, it is unfair, because in case of the premium in the open market being lower, the State would not have the business.

1630. That is perfectly true?—But in the case of the man who wanted to run a very risky adventure, he would go to the State and say, I want your policy. It is not fair at all to the State or to the competitors.

1631. Of course, the extreme risk would be governed by the fact that he would have to comply with Admiralty regulations, which would avoid anything of that class. We have been told here that underwriters are very good judges of war risks. Do you take that view, or do you think they are liable to be very much misled?—I think underwriters may be presumed to know their own business, but I think they are led away from a right judgment by force of competition. They very often do a thing against their own judgment, because they are obliged to, because their competitors are willing to do it and they will lose all their business unless they do the same thing.

1632. You mean their judgment on the measure of the risk would be good, but it is liable to be vitiated by the difficulties of competition?—Yes, I think in case of war the State would be very much better able to do justice and give people satisfaction, than the underwriters would.

1633. When you said that we might find ourselves in the China seas in as hopeless a position as the Japanese were in the Mediterranean, what kind of war were you contemplating?—I do not think it is impossible we might have war with Japan one of these days.

1634. In no other case would that hold?—Of course, America I hold to be almost an impossibility, but it would apply in that case.

1635. Could you tell us whether it has been usual to include marine risks with war risks when war risks have been taken out, or are they always treated separately?—In times of peace it is very usual to have the two together. In times of war, I think, underwriters are sharply divided into two classes, those who are willing to take war risks, and those who are very unwilling to do it, and you will find the risks taken separately. But the difficulties that I have read about as to questions arising as to which policy a loss would come upon, whether a war policy or a marine policy, are very much exaggerated. Such questions are always liable to arise, because, as I say, the war risk and the marine risk in times of war scare or in times of war are, as a rule, divided.

1636. So that if anything of the nature of Scheme B were decided upon, the ordinary marine insurance would go on as usual?—Yes.

1637. And it might be possible to take the values accepted for the purposes of marine insurance for the purposes of the war insurance?—A very unsafe guide, I should think, because if a man wanted to commit a fraud as a war risk, to get a steamer captured, he would magnify the value of his sea policy to any extent, and the underwriters would not mind, because they would know that it was not a sea risk the ship was running. In some cases the sea risk might be worth 5s., and the war risk might be worth 50 guineas. If you are going to accept the marine policy as the value in the war risk, a man could insure for ten times the value of his cargo and pay 5s. per cent. for the marine insurance, on the chance of his getting a war policy at the same figure.

1638. Because on the hypothesis he is going to get his war risk taken at a fixed low rate?—Yes.

1639. It is not a question of 50 guineas per cent. for him?—No, it is a question of 10s.

1640. Perhaps not that; but it is not a question of 50 guineas?—That is the sum that I heard mentioned.

1641. Are there any associations of underwriters or of shipowners who agree to compound their war risks?—Yes, clubs. They are absolutely useless, I should think; a delusion and a snare entirely.

1642. The nature of the agreement is simply that any risk which falls upon any member of the club is shared?—Yes, and therefore those that run the big war risks would get their money out of those who took the safe course. It is absolutely nonsense.

1643. But such things do exist?—They do exist. I wonder how they can. They do not cost anything to belong to, that is the reason.

1644. (*Mr. Beauchamp.*) There are practically two schemes, the scheme of free indemnity and the scheme of purchased indemnity?—Yes.

1645. The purchased indemnity scheme could only come into operation after the outbreak of war. Do not you think there would be very great difficulty in a Government department carrying on a business of that nature after the outbreak of war?—Yes.

1646. It would be almost impossible to get anybody to supervise efficiently a department of that kind?—The whole thing would be in a flurry and scare.

1647. And therefore you are in favour of free indemnity rather than purchased indemnity, as far as regards the cargo?—Yes.

1648. The cargo is not to pay anything, only the ship?—Yes.

1649. I do not quite understand your reason for calling upon the ship to contribute and not the cargo at all. The ship would contribute in time of peace, you think?—Yes.

1650. Do you think you would get hold of a little nucleus of money?—No, that it not the idea so much as that I think there is a great concrete advantage to the shipowner. He can see his risk more plainly than the cargo owner or the merchant. It is more easily realised by the shipowner that there is this risk, and it is one that I should have thought is worth getting rid of for such a small payment. The values are very much less also.

1651. And you would charge the same fee to the tramp steamer as you would to the fast steamer?—Yes.

1652. You would put them all on the same footing?—Yes, but I do not think you would be able to charge it to any but steamers engaged in foreign trade. I do not know about that. That is a point I should like to consider.

1653. Of course, there are certain lines who do not insure against marine risks at all. Do you think

they would come into a scheme of that kind? You see, some of those companies can insure their risk against a total loss from a marine peril for about 17s. 6d., or 1 per cent., and we should be asking them to pay 2s. 6d. for a problematical risk. Do you think they would come in under those circumstances?—I should have thought they would have come in. I should think, if the shareholders and directors were all consulted, they would say it was worth while coming in. But I think possibly a managing owner who had got to produce a balance-sheet would kick at paying. I do not know. I am not qualified to say what the shipowners would think about it. I should have thought it was a good offer to make them.

1654. Of course, the amount of business done in any one day, the number of different risks, is something enormous, is it not?—Yes.

1655. Have you any rough idea of what might be the number of policies taken out in London only in one day?—I do not know. I have never thought about it. I should think something like fifty to a hundred thousand policies a day.

1656. All those policies, under any scheme of payment of some form of premium, would have to go through that one department which is to be erected after the outbreak of war?—That is it. It amounts to that.

1657. And that would render it practically impossible to carry out after the outbreak of war?—Exceedingly difficult; practically impossible.

1658. Your desire to see something of this kind is to keep down the price of food and raw material?—Mainly.

1659. That is the one great object?—Yes, and maintaining the supremacy of our commercial marine.

1660. You think that the price of food and raw material would go up very considerably after the outbreak of war in consequence of the rise in war premiums?—Largely in consequence.

1661. I mean to say that would be one of the factors?—Certainly.

1662. And you think that a war premium, if war broke out, say, between this country and Germany or France, would be very considerable?—I think it might be very heavy indeed.

1663. Have you thought out any of these wars, and what the premium might be in any particular war?—As I say, it would be entirely a matter of imagination.

1664. It is guess work?—It is guess work.

1665. But supposing we were at war with France, for instance, have you formed any idea at all what might be the probable rate of premium on grain from the Black Sea through the Mediterranean?—Straight away, as things exist now?

1666. Of course things have to be very high to increase the cost very much. I wanted to know whether you had formed any idea of what the premium might rise to?—Supposing war broke out to-day between France and England, I personally should not be inclined to write steamers from the Black Sea at five guineas per cent. against war risks.

1667. Do you think that if we were at war with Germany there would be much danger of capture of ships coming from the United States or Canada with grain?—No, I should not be inclined to think that was a great risk. It might develop into one, though, in a very short time, in consequence of fast cruisers, or something happening. Of course, the Mediterranean risk is a much greater risk.

1668. And coming up our Channel, do you think the premium would be very heavy if we were at war with France?—At first I should think, before anything happened, you would get underwriters to write it at 1 per cent., but if any vessels began to be captured it might go up to 20 at once.

1669. The premium would be jumpy?—Very jumpy.

1670. If we had news, for instance, of a couple of vessels being captured on a particular route, that would cause the premiums to rise very quickly?—At once. It might be impossible to cover a cargo at any reasonable price.

1671. And as the premium rose the market would become smaller and smaller, would it not?—Yes, certainly.

1672. (*Sir Thomas Glen-Coats.*) Do you think there would be much less risk of captures or detention on cargoes carried in ships sailing under a foreign flag than under our own flag in time of a European war?—Bringing cargoes to this country?

1673. Yes, ships under a neutral flag?—It would depend on what the enemy declared to be contraband of war.

1674. But I mean the food stuffs?—If they declared food stuffs to be contraband of war, which would be quite possible, and probable, I think it would be equally difficult with foreign flags.

1675. Then I think you say you are doubtful whether you would extend indemnity to the cargoes of ships sailing under a neutral flag?—Yes, I was in doubt about it. I have never considered the point.

1676. What about the ships themselves? Would you be inclined to extend this insurance scheme of paying a small premium of 2s. 6d. per cent. per annum to any ships except our own?—No; none except our own.

1677. If this were adopted for our own protection, would not this almost prevent foreign ships from carrying food stuffs to our country, or would it not be the case that the premiums would be so high that they could not compete with our own ships?—Yes, it would be favouring our own ships certainly. It would not increase the difficulty of the others, but it would be favouring our own.

1678. Do you think we have sufficient capacity in our own ships to carry all the food stuffs and raw material that would be required during that time, supposing ships under a neutral flag were debarred from the indemnity?—Yes; I should think so.

1679. Then in that case the cost of freight would not rise very much?—It would not rise owing to a large war premium being charged, but there would be other conditions which would make it to rise to a certain extent; the price of coal, for instance, or the detention necessitated by the Admiralty regulations. Freights would rise, no doubt, but to nothing like the extent that they would in case a heavy war premium had to be paid.

1680. My point was rather this, that if the capacity of our own ships was insufficient to carry all that was required in the way of foodstuffs and raw material during time of war, then we would require to employ ships that were sailing under a neutral flag. They could not carry at the same rate as our own ships. They would put up their freight to a higher rate, and naturally our ships competing with them would put up their freight?—I see the point. It would be always possible in a matter of that sort to offer an indemnity.

1681. To bring them in just at the last?—Yes. That was done in the last war. The Russians gave the British shipowner an indemnity against capture. The British shipowner thought so little of the value of the indemnity that he preferred to insure with the companies.

1682. Would you propose that our ships should begin to pay this 2s. 6d. at the present time, and let the foreigner in at the last moment?—You would not let him in for nothing.

1683. Not at the same rate?—Oh, no. It would only be in an emergency, as I say.

1684. Might not that amount almost to as much as a war premium with underwriters?—No, it would not amount to as much as a war premium. Of course, it is a very problematical thing we are discussing, but it would be quite possible for the British Government to offer an indemnity to a neutral flag to bring in cargoes, on the ground of absolute necessity. You must have your food. But it is almost impossible to contemplate the state of things that our own ships would be unable to bring it. I do not think it is any practical objection to this scheme of indemnity. The possibility might arise, and it would have to be dealt with.

1685. (*Captain Ottley.*) The objects of our scheme really, I think, are two-fold. One is the idea of preventing enormously enhanced prices, and, therefore, terrible distress in this country, and the other object of our scheme is as far as possible to foster the British flag as distinct from the neutral flag?—Yes.

1686. We think that the British shipping industry is our premier industry, the breath of our national life, and we think that we ought to support that; so that there are two distinct objects. I should like to ask you, in the light of those two objects, what you think would be the effect of a cargo of grain coming in a neutral ship from America if the enemy declared

Mr. S. A. Boulton.

19 Mar. 1907.

that cargo of grain to be contraband. Would the United States stand that, do you think? The United States being a neutral, and this being a cargo of grain owned by the United States, consigned to the United Kingdom, do you think the United States would calmly look on and allow that cargo of grain to be captured under a neutral flag?—They might not look on calmly, but they would have to look on, I think.

1687. And in the event of that sort of thing being continued largely, large quantities of American grain ships being captured, do you think the people of the United States would not raise a tremendous outcry against the enemy?—Yes, I think they would, but it would not do them any good. They could not enforce the outcry.

1688. You do not think that the effect might be to compel the United States Government to deliver an ultimatum to the enemy to say: "This thing must stop; it is not true contraband of war, and it must stop"?—No, I do not think the United States would have any voice in the matter at all. They would have nothing to back them up with.

1689. (*Sir George Clarke.*) They have a tremendous navy?—Yes, but not to use in foreign waters. I do not think that for the sake of a few grain cargoes the United States would scatter its navy into European waters.

1690. (*Captain Ottley.*) You do not think it might turn the scale. If one imagines one branch of the Anglo-Saxon race at death grips with a Continental power, and then this additional aggravation to America, you do not think it would bring America into the difficulty?—No, I should not place any weight on an argument of that sort at all.

1691. I quite understand your view. There would be some kinds of merchandise that would not be contraband of war?—Yes.

1692. Let us take, for instance, raw cotton. Raw cotton is not contraband of war by the hypothesis?—No.

1693. There are two ships starting from the United States, one under the British flag with raw cotton, the other under the American flag with raw cotton. Would they each pay the same war premium, or would not the American ship pay a very much smaller premium?—At the present time, you mean, with no indemnity scheme?

1694. No, I am talking of matters as they stand exactly at this moment. There are two ships, one of them under a neutral flag, the other under a belligerent flag, both of them laden with goods which are not contraband of war under the Treaty of Paris. The belligerent ship is liable to capture, and the other is not?—Of course, the premium would be higher on the British ship.

1695. The British ship, then, would have to pay a higher premium in order to obtain the same security?—Yes.

1696. It appears to me that that is tantamount to saying that the neutral ship can take her cargo at a much lower freight, so that if we have got those two ships in New York Harbour, one with the British flag up, and the other with the United States flag up, the one with the United States flag up would get the cargo?—Yes. The difference in premium might not be very large.

1697. Do not you think it would be large. Suppose there was a war with an Atlantic power, such as France, do not you think the war premium on the British ship might be a considerable thing?—A cargo of cotton?

1698. The British ship is liable to capture?—I know the British ship is, but there is no object in capturing a British ship if it is bringing a cargo of cotton. It is not the same as attempting to starve the country out.

1699. There is the same object as there is in capturing any other ship. The great object is to destroy British shipping?—Yes, that would be one of the objects. As I said before, I do not think the premium from the United States, in the event of a war between us and France or Germany, would be very high, unless some circumstances arose which showed the risks were very great. *Primâ facie*, the risk is not a very large one.

1700. Then instead of taking it from the United States, shall we take it from the Black Sea?—Yes. Then you get into food, you see; you get into contraband of war.

1701. (*Chairman.*) May I interject one question before we leave the cargo from the United States? Suppose we were at war with France or Germany, what is your idea of what the premiums would be, in the first instance, for a voyage across the Atlantic?—In the first instance, 1 per cent. or a ½ per cent.; something of that sort.

1702. (*Captain Ottley.*) You do not think it would be more than that; but for what it is worth it would be payable by the belligerent ship, that is to say, the British ship, and not by the neutral competitor?—Yes, it would be a handicap on the British ship to some small extent.

1703. The argument, as far as it goes, seems to show that war premiums paid by the British ship are tantamount to a bounty on the neutral ship?—Yes.

1704. It seems to me that is perhaps one of the arguments in favour of the scheme which you have put forward, a scheme of indemnity rather than a scheme of insurance?—Yes.

1705. Do you think that your indemnity, which is to be paid in peace time as well as in war, might take shape in something very small, such as a stamp duty on ordinary insurance policies *pro rata* on the value; that if you are insured for £30,000 you might probably pay £10 for your stamp duty?—Do you mean to make it smaller than an ⅛ per cent.?

1706. To make it something extremely small?—Yes. I think possibly it might be advisable to make it a good deal smaller than an ⅛ per cent., as I say, merely a registration fee really, the object being to settle values and questions of that sort, and not much importance being attached to the amount of income which might be derived from it.

1707. It would be possible to work out. Mr. F. Bolton, your namesake at Lloyd's, has formed some conception of the kind of total sum that the country might find itself pledged to pay if it adopted either this form of insurance or an indemnity. I think he finds the total destruction would be somewhere about £5,000,000. But no great naval war has taken place with this country for something like 90 years?—No, that is the difficulty of the whole thing.

1708. Therefore it seems to me it might be possible to calculate something extremely wrong, but on the assumption that we get another 20 years of peace we might see whether we could roll up £5,000,000 without putting a very heavy tax upon our shipping in peace time?—I calculate that the tax of an eighth per cent., if every steamer had to pay it, would produce about £200,000 a year.

1709. That would be £2,000,000 in ten years?—Yes.

1710. That would be £4,000,000 in 20, or £5,000,000 in 25 years?—Yes.

1711. That is what we want?—But I am not so optimistic as my namesake. I should be very pleased to think that the country would not be liable for more than £5,000,000. I would not say that it would not be liable for £50,000,000.

1712. Of course it must be pure guess work?—But £5,000,000 is really staggering in its moderation.

1713. Yes, I must say I was astounded at the moderation of it?—When you consider that taking Vladivostock alone the losses were £2,000,000 in that one place.

1714. Yes. I have two or three questions more particularly of a naval character which I should like to ask you bearing upon this point. You compared the merchant ships to a flock of sheep at the mercy of a wolf. I think that is a very excellent comparison, more particularly because the appetite of the wolf is a limited factor. Do you imagine that an enemy's cruiser would be able to send her prizes into port. More particularly take the case of Germany, for instance, capturing prizes in the Atlantic?—No, I think the only war that would give facilities for sending prizes into port would be a war with France, in the Mediterranean. If they were not shut up by our fleet in the Mediterranean, they would have every facility for doing that. But I have a lower view of human nature in that I think if we had a war with Germany they would sink our ships.

1715. Do you think they would sink officers, crew,

passengers, and all?—No, I do not think they would do that. They would send them off in steam pinnaces, and put them on the coast, or something of that sort.

1716. Then supposing the weather was so bad that they could not take the crew off, just an ordinary half gale of wind so that boats would not lie alongside, in that case what would happen?—I do not know. I do not think they would murder the crew.

1717. They could not murder the crew, obviously; at least I do not think they could. But in the case that you think would be the more ordinary one they would take off the passengers, the crew and captain and everybody, and sink the ship?—Yes.

1718. Supposing an enemy's cruiser captures three or four vessels while she is out on patrol, what is she going to do with the crew and passengers of those vessels. I imagine a single Atlantic liner would fill her chock full?—Yes, she would have to get rid of them. As I say, they would land them with steam pinnaces. It does not matter where they land them. It is not like coaling, or anything of that sort.

1719. Of course the trouble is that directly they make the land we pick them up, and one hopes we should capture them. They must keep clear in the blue?—Yes.

1720. If you imagine the case of an enemy's cruiser under modern conditions, we must assume *ex hypothesi* that the captain of that ship is aware that the British Fleet is in superior numbers, so that every time he sees the smoke of a vessel on the horizon he is in two minds; she may be a merchant ship, or she may be an enemy's cruiser. How long do you think this operation of taking off the men would take in ordinary weather?—Of course I cannot speak as to that. I am not a seaman.

1721. Do you think it might take two hours?—I think it might be done in less than that. I do not know.

1722. Possibly it might be done in less. However, I was asking you. Suppose we say an hour?—Of course it is a subject on which you know a good deal and I know nothing at all. I should have thought it might be done in an hour.

1723. During all that hour the enemy is in this uncomfortable position. He has to sink the ship or else leave her afloat, and the process of sinking the ship may take some time. So that I think what was really in Mr. Bolton's mind when he came to this comparatively low estimate was the consideration that these difficulties under modern conditions would make it relatively not so easy as it was in the old times?—It is possible. I hope so. Still it is a matter of guesswork even with the greatest authorities.

1724. (*Chairman.*) You have said, I think, more than once in answer to questions that your great object in having the one-eighth per cent. premium is to fix values in peace time apart from scares, and that your desire is that if war breaks out and a loss is incurred, no scare value should be paid for the ship?—Yes.

1725. But you recognise that in peace time it will be necessary to revise values say annually?—Yes.

1726. That would involve their being also revised after war had broken out?—Not unless the war lasted more than a twelve month, and even then it would not be necessary.

1727. Probably the policies on some of the vessels would expire. There would be some vessels on which the policies expired on each day of any given year?—No; I think I would make it like a licence, expiring all on the 1st January, to simplify the thing.

1728. Then suppose war broke out in November, it probably would not have been concluded by the 1st January next; how would you arrive at the values on that 1st January?—In case of war the value fixed in peace time would stand.

1729. Until the conclusion of the war?—Yes.

1729*. (*Sir George Clarke.*) It was suggested to you that the whole business of insurance under such a system as Scheme B, perhaps to the extent of £100,000 in premiums a day, would have to be carried out by a State Department created in a great hurry at the outset of war. Do you see any difficulty in handing the State premium forms over to underwriting firms and asking them to complete the business on behalf of the State, on commission?—Yes, I think there would be great difficulty in that.

1730. We have been told by some witnesses that it could be done. Could you say what the difficulty would be?—I think the difficulty of organising such a thing as that in time of war is evidently very great, and must be very great. Everybody is more or less panicky and excited; people are not calm, and their business is being interfered with all round, and unless the whole thing is cut and dried beforehand I think there inevitably will be great difficulties.

1730*. But supposing it could be absolutely cut and dried, and the State merely handed out to the underwriters certain forms, and they did the rest on behalf of the Government, receiving a commission, do you see any absolute objection to that?—As a business arrangement, I should never give a power of that sort into the hands of people that I knew very little of. You hand over the whole risk to people who are not going to run any risk themselves. You say, you may take as much risk as you like for me, and it does not matter; you lose nothing, whatever happens. I think it is a large power to give anybody. It is only when you have great confidence in a man that you put such power into his hands.

1731. Of course, there is no latitude whatever except, possibly, over-stating the value?—He charges the State premium.

1732. He charges a premium laid down in a perfectly simple, straightforward schedule. He has no discrimination except as to the value?—I am opposed to the scheme. I think the whole scheme is so impracticable and unbusinesslike, to charge the same premium for everything. It is like charging the same price for any article.

1733. Of course, the proposal might not be to charge the same premium for everything, but to charge a special premium on special routes?—Then you are going into the whole scheme of insurance business if you vary the premium; you have either to take the market price or you have not.

1734. The theory is that the premiums should be settled to-day, so much for a certain portion of a route, so much for another portion, cutting the world, as it were, into zones, with a special rate in each. That may be settled to-day, if we choose. Considerations of insurance work do not enter into that; it is quite arbitrary?—Yes, I know.

1735. So is your 2s. 6d. perfectly arbitrary. It does not bear any relation to the risk?—Not at all.

1736. They are both arbitrary?—Yes, but either you have got to charge one premium for the whole world or you have to cut it up into routes, as you say, and you do that all in peace time, and when war breaks out you may have a risk, which you have fixed at 10s. for the route, that is worth 10 guineas, and a risk that you fix at 10 guineas which is worth 2s. 6d.

1737. But you have done everything that is necessary; you have steadied prices and stopped panic in our trade?—But I do not see how you steady prices and stop panic in our trade by charging a premium. I think the premium is no essential part of that plan at all. It is better without it.

1738. But you have said it is the sudden rises and fluctuations in premiums which alone could give rise to the panic. If you remove all those fluctuations where does panic come in?—I say you do not effect that object by charging a premium. You might just as well charge no premium. The premium is an element of difficulty without being an advantage.

1739. I cannot follow that. The question is not the premium so much as the capriciousness of the premium, the sudden bound and the sudden fluctuations, perhaps from day to day. Then I will sum it up that you think that any form of premium, however low, and however calculated, will not effect the object that we have in view?—Yes; I say the payment of the premium will not effect the object.

NINTH DAY.

Monday, 25th March 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Captain C. L. OTTLEY, R.N., M.V.O.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. ARTHUR LINDLEY.

Mr. GEORGE H. DUCKWORTH, *Secretary*.

Mr. JAMES THOMPSON BINNING, called and examined.

Mr. J. T. Binning.

25 Mar. 1907.

Mr. Binning, in a preliminary memorandum,* had submitted:—

(1) That in the opinion of the Liverpool Underwriters' Association it is not desirable for the State to undertake either of the schemes ("A" and "B") before the Committee.

(2) That it has not been proved that either scheme would secure to the nation the object desired, viz., an adequate supply of food and raw material in time of war at prices not unduly inflated.

(3) That the cost of war insurance is not the only factor in the increase of prices in wartime, and that there is no evidence that it alone would be a serious deterrent to the importation of adequate supplies

(4) That the existing facilities for covering war risks are adequate for the purpose, and would not be more expensive to the nation than either of the schemes suggested.

(5) That the schemes in question would hinder commerce.

1740. (*Chairman.*) You are chairman of the Liverpool Underwriters' Association, I think?—I am.

1741. And you come before us to-day to represent that Association?—To give you as far as I can their opinion on the schemes which are before this Committee.

1742. The Liverpool Underwriters' Association have had before them the two draft schemes, have they?—Yes.

1743. And the views which you are going to put before us are the conclusions at which they have arrived on consideration of those schemes?—Quite so.

1744. Briefly put, I think their view is that the schemes would not secure the desired result?—Yes.

1745. And that they are unnecessary and unworkable?—I should not say unworkable. We think that these schemes would be more expensive than the present system, and would therefore not attain the desired object for that reason.

1746. Would your criticism apply not merely to the two drafts we sent you, but to any scheme of State guarantee which you can conceive?—Not necessarily so. I rather think that these schemes miss their mark in tending to put a premium on losses rather than on arrivals. I take it that the object of the Government is to secure as far as possible the import of food, and to encourage shipowners to keep their ships at sea; and I hardly think that that result would be so well attained by paying the man who succeeds in getting his ships captured by the enemy as if the man who succeeded in importing the food were paid. I can conceive of a scheme being devised which would accomplish that end.

1747. Is your first objection to the schemes that we have put forward, that they would encourage shipowners to recklessness, or perhaps even to fraud?—That might be. I think shipowners undoubtedly would take greater risks than they would do if a scheme of this kind did not exist.

1748. Supposing there were no scheme at all, what do you imagine would happen on the outbreak of war? Would there be a great rise in insurance?—There would undoubtedly be a considerable rise in insurance, due very largely to the fear of capture. Probably the fear of capture would have a greater effect on prices in this country than the actual captures themselves.

1749. What in your view would be the result of that rise in insurance rates?—That would be one of the factors of rising prices—not the only one, and not necessarily the largest.

1750. Would it, do you think, check the importations of food stuffs and raw materials to any great extent, or would they be able to stand the increased cost?—I think the competition amongst underwriters is so great that the premiums would not be unduly high. It rather seems to me that these schemes are based on the assumption that there would be a panic amongst underwriters in the event of war.

1751. And you do not think that likely?—I do not.

1752. On ordinary occasions is not the market for war risks a very limited one?—I do not think so. I think our experience in the last two wars, the Spanish-American war and the Russo-Japanese war, has shown that there is a very large market for war risks in this country.

1753. Can you give me any indication as to the size of the Association which you represent?—Our Association is composed chiefly of a number of large marine insurance companies. There are a few private underwriters in it, but it is chiefly composed of marine insurance companies with large writing power.

1754. Could you give me any idea of the volume of marine risks which they habitually carry at any one time?—I have not those figures with me, but they are very large indeed.

1755. Do most of the companies represented in your Association take war risks as well as the ordinary marine risks?—A number of them have done so in these last two wars.

1756. Speaking generally of the insurance world, would it be true to say that there are a great number of people who will underwrite a marine risk, but will never look at a war risk?—That has not been my experience. No doubt there are some, but I should think they are in a minority.

1757. It has been suggested to us that the volume of shipping and trade to be insured in the case of a great naval war in which we were engaged would be so vastly superior to anything of which we have experience, that it would be impossible to insure it at all; but I gather that you do not share that view?—We do not share that view in Liverpool. I think our view is, as stated

* *Vide* note, p. iii.

in the *précis* of my evidence, that the existing facilities for covering war risks are adequate.

1758. But I suppose that in the first weeks of a war there would be considerable captures?—No doubt there would be.

1759. I think one witness recently said to us that under such circumstances the market for war risks would dry up and vanish?—I cannot conceive such a state of things, unless credit was so much impaired in this country that there would be nobody to handle the cargoes if they arrived.

1760. In your view, therefore, the ordinary companies and private underwriters would be quite equal to taking the whole of the risks?—I think so.

1761. And would take them at reasonable premiums? Yes, I think so. Hitherto there has been no evidence. I think, that war premiums have been excessive. Of course, under certain circumstances they might be—under similar circumstances, for instance, to those in the Russo-Japanese war, where contraband was being taken into Vladivostock; then, of course, the premium must be high. But in the case of Japan the premium was comparatively a low premium, 2 per cent. probably.

1762. At any time during the war?—Perhaps it may have been 3 per cent. at the first, before there was reason to believe that Japan would be stronger on the sea. There was a little doubt at first as to whether she would be very much stronger than Russia.

1763. After Russia had captured or sunk one or two vessels in the Red Sea and in the Nearer East, were those moderate rates still maintained?—They were still maintained. Of course, when the superiority of Japan was demonstrated, the rate fell away to a very nominal one.

1764. What are the other circumstances to which you referred just now which would tend to raise the prices of food and raw materials?—On the apprehension of war, all markets are more or less manipulated. I take it that would be the case with the cotton market, the corn market, and the freight market also. The extent of the uncertainty would at once be made the most of, and all the market devices would be used to raise the price of various produce.

1765. You do not think, I gather, that any considerable proportion of our shipping would be laid up in such a war?—I do not think so. I think, as a rule, war times are very good times for shipowners. There is a great deal of money to be made in them.

1766. Of course, if we were one of the belligerents, our shipping would be exposed to a risk which the neutral shipping would not run?—Yes, no doubt it would.

1767. The insurance, therefore, both on our ships and on English goods shipped in British bottoms, would be considerably higher than the insurance on neutral ships or on British goods shipped in neutral bottoms?—No doubt.

1768. Would that not have a very adverse effect on the shipping trade?—Yes, and I suppose it might tend to make shipowners see if they could not get round it in some way.

1769. In what way could they get round it, except by a transfer of their shipping to a neutral flag?—I do not know, and I do not know whether they could transfer their shipping to a foreign flag. I should think it is very doubtful if it would be allowed after the outbreak of war.

1770. I think you may take it that a *bonâ-fide* transfer, made even after the outbreak of war, would be, and ought to be, recognised by a belligerent; we have certain cases decided in our own Courts to that effect at any rate. But you are not afraid of the extra risks run by British shipping, resulting in that shipping being either laid up or transferred?—No. My view is that if we went to war it would be a very short time before shipowners could see exactly what the effect of the war was going to be, and would act accordingly.

1771. But there might be three or four months of uncertainty to begin with?—Yes, possibly, but probably not as much as that. I think probably shipowners would see their way before that, and decide as to what their action should be. Of course, if the fortunes of war were going very hardly against this country, I can quite understand their transferring ships largely to a neutral flag.

1772. But even supposing the war to proceed successfully, might it not be the case that in the early stages of the war our naval supremacy had not entirely made itself felt, and that there would be considerable captures?—I think there would be considerable captures at first, if the enemy, as no doubt they would, directed their attention entirely to our commerce and our food supply. *Mr. J. T. Binning.* 25 Mar. 1907.

1773. Let me suppose the case of a war with France; there might then be considerable captures in the Channel perhaps?—No doubt.

1774. What effect do you think they would have upon rates? Suppose there were a certain number of large captures in the first week of war?—The rates of premium would rise accordingly.

1775. Might they not become almost prohibitive?—Not necessarily. In the case of contraband and other produce that was imported into Vladivostock, the rates were 25, 30 and 35 guineas per cent., possibly 40 guineas per cent. in some cases.

1776. Of course, any rates like that upon raw material would kill a great part of our manufacturing trade?—Yes, if they existed for any length of time.

1777. Even for a very short time they would produce very serious distress, would they not? If, for instance, cotton were exposed to rates like that, the distress in Lancashire would be very great?—It would, no doubt. But then I think the war rates would vary very considerably if there were communication between the Admiralty and underwriters. If underwriters were given to understand what protection was likely to be given, their rates would be modified accordingly.

1778. Do you conceive it possible that, situated, as we are, rates should rise to such a figure as 30 guineas, for instance?—I think things would have to be in a very bad state indeed before that happened

1779. Supposing us to be at war with either one great European power, or a combination of two great European powers, can you form, in your own mind, any idea what the rates on corn or cotton from America, say, would be likely to be?—I am afraid I cannot, without knowing the exact circumstances. I think they would be fixed entirely according to circumstances.

1780. (*Sir George Murray.*) Let me put it in another way: What do you conceive to be the maximum rate which our shipping and foreign trade can stand, without serious inconvenience and without a serious risk of transfer to a foreign flag?—I really have never thought of it. I think that is a question for a shipowner or a merchant rather than an underwriter.

1781. (*Chairman.*) In the *précis* that you have given me, you say that the schemes before the Committee would be "commercially unworkable"; would you explain your views on that point rather more fully?—I take it that a large State department would in any case be constituted under either scheme, and it seems to us in Liverpool that the cost of working that would be very much greater than the cost of the present system. We do not see how any committee, however expert—I think it is called a board—is going to fix premiums and assess values and pay claims with what shipowners would understand to be promptness, without at the same time admitting a great deal that is improper and, possibly, even fraudulent. There would be such a congestion of work in such a department, that we think it would be more expensive on that ground alone.

1782. You notice that there is a difference between the two schemes. Scheme B requires from the shipowner the payment of a premium or a contribution in return for the guarantee which he receives, while scheme A has no such provision. Would it not be possible to work Scheme A without such a large department as you have suggested?—I do not think so. Scheme A would be more largely adopted and availed of by the shipowners than Scheme B. I think, in the case of Scheme B, the shipowner would, in the first place, go to his ordinary underwriter, and if his ordinary underwriter quoted a reasonable rate, he would do his insurance with him; but if his ordinary underwriter quoted a high rate, he would insure with the Government.

1783. That probably appears to you a very unbusinesslike arrangement?—Personally speaking, I should welcome that scheme, because I think it would relieve me as an underwriter from all the bad risks, and would saddle the taxpayer with them.

Mr. J. T. Binning.

25 Mar. 1907.

1784. Of course the object is to prevent the premium rising to such a height as would seriously interfere with trade?—Quite so.

1785. Your answer to that, as I gather, is that you do not think it is necessary, because you do not think that the premium will rise to a prohibitive rate in any but very exceptional cases, and for very short periods?—Quite so.

1786. But in the case of Scheme A, where there is no premium, the State would only be concerned to investigate the cases of losses or alleged losses?—That is so.

1787. Instead of having to value every ship and every cargo, and to issue a policy on every ship and cargo that sailed, it would only investigate values where a claim for loss was made?—That is so.

1788. Would that be, in your opinion, an impossible task?—It would be a very serious task, if prompt payments are to be made. There is another point, I think, which is not provided for here, and that is delay and demurrage. It seems to me that that would have to be met, otherwise the shipowner would not avail himself of Scheme A. I take it that the Admiralty would lay down certain regulations for the shipowner, and he would have to obey those regulations, and that might lead to very serious delays.

1789. Would it not be to the interest of the shipowner to obey those regulations or to listen to that advice—even if it were mere advice—quite apart from any scheme of this kind?—It would, but it adds to the cost to the nation, because the shipowner has to pay his crew during the time that the ship is kept waiting, and has to pay for provisions, coal, and what not. All that cost is going on all the time, and he has to get that from somebody—either in his freight or in some other way.

1790. But he would have to get it whether he was insured or guaranteed by the State or not?—Undoubtedly, but I take it that if he were not insured by the State, he would be absolutely free to do what he likes. With his ordinary underwriter he would be quite free—within the limits of his policy, of course. There might be warranties in his policy that he should not do certain things, but within those limits he would be quite free to go where he liked and to go when he liked.

1791. I presume that such instructions would only be issued by the Admiralty with the object of preventing the ship being captured by the enemy?—Quite so.

1792. Would not the underwriter need the same protection against the shipowner wilfully throwing his ship away, or taking a risk which practically amounted to a certain loss?—We have not, of course, to deal with those cases now, but we have the machinery and the organised facilities for information which enable us to deal with cases of that kind. I think that the fact alone that we have those organised facilities, and also the facilities for salvage in the case of loss, in the case of stranding, and so forth, through associations which are not working for profit, are all points in favour of the present system. The Government would have to pay salvage companies, and probably would have to pay fairly heavily, and it would hardly have the other facilities that we have—all the accumulated information that we have, for instance.

1793. It is not suggested that the State should guarantee the shipowner against marine losses under any circumstances?—No, I understand that; and there might be further difficulties there. The conflict of interests between the Government and the ordinary underwriter would become apparent in certain cases.

1794. As for instance?—As for instance in the case of a missing ship, or any other case where the loss could not be absolutely proved to have arisen from a war peril or from an ordinary sea peril.

1795. Is there not a rule of practice already prevailing in the insurance world in such cases, and is not the loss presumed to be a marine loss unless it is proved to be a war loss?—That, no doubt, has obtained, but I do not know whether it could be relied upon to be acted on in all cases. I take it that if there were a likelihood of a vessel having been lost by a war peril, the ordinary underwriter would probably decline payment without further investigation, and would delay payment. In the same way the Government would probably refuse payment. While the underwriter and the Government argued the matter out, the shipowner would have to lie out of his money.

1796. It happens now, does it not, not unfrequently, that a man is insured in two different offices, or on two different policies?—Yes.

1797. On one policy for the war risk, and on another policy for the marine risk?—Yes.

1798. So that the conflict of interest may arise now?—Yes, it may; but in most cases the shipowner and the shipper or merchant would prefer to have the war risk covered by his own underwriter who has insured the goods, and when he can do it without undue expense he does so.

1799. Does the ordinary policy cover loss by demurrage for delay?—No.

1800. What happens then at the present time in regard to the loss from delay?—The shipowner has to bear it.

1801. I understood you to put that as an objection to any scheme of national guarantee?—No, I do not put it as an objection, but I think it is a question that will have to be taken into account. If the shipowner is to be subjected to a serious delay by the Admiralty or by the Admiralty regulations, then I think you will have to take that into account, otherwise he will not avail himself of the scheme.

1802. Of course a shipowner who deliberately refuses to abide by the Admiralty regulations, or to listen to Admiralty advice, may be assumed to be taking a very great risk?—Undoubtedly he would.

1803. Under those circumstances he would want to insure himself somewhere?—Yes.

1804. If he went to an underwriter and disclosed to the underwriter the fact that he was advised by the Admiralty not to sail because of the presence of an enemy's cruiser, we will say, or of an enemy's fleet on the route, but that he intended to sail all the same, the underwriter would expect a very high premium to cover that risk, would he not?—Yes, he would no doubt; but I can conceive of circumstances in which the shipowner would say, "I mean to take this other route; what do you think of it? Are you prepared to quote a premium?" And a premium would be quoted. It would then be for the shipowner to decide whether it was worth his while to run the risk or not.

1805. I think, from something you said earlier, that you are more afraid of fraud, or, at any rate, of a shipowner taking undue risks, if there is a national guarantee, than if he is left to insure himself by the ordinary means?—I think there would be a great many more cases of what I may perhaps call the prudent shipowner. To give an example, in the Spanish-American war a certain shipowner of very high standing had three ships sailing under the Spanish flag to the West Indies. Two of these ships were obsolete, and one was modern. He insured those three ships, I think, at Lloyd's, against war risks for half-a-guinea per cent. for a period of time. The two old ships were sent to sea, and both were captured and confiscated by the Americans; the modern ship was kept carefully out of the way of the capturers, and is running still, I think. I am afraid that would happen to a very large extent under these schemes. There was no fraud in that case of any sort, and no suggestion of it at all; but one might say it was a very fortunate thing for that prudent shipowner.

1806. In the case of an ordinary policy you would take the shipowner's valuation of his ship without much dispute, would you not?—It is entirely a matter of bargain between the shipowner and the underwriter.

1807. And the underwriter is not generally disposed to question the value which the shipowner puts on his ship?—No, I think he determines his rate according to the value. The value may be high or it may be low; it affects the underwriter in certain respects, and he takes those things into consideration in quoting the rate. If he thinks it affects him adversely, he quotes rather a higher rate; if, on the other hand, it is in his favour, he would quote a rather better rate.

1808. Generally speaking, the valuation of the ship does something more than protect the shipowner against loss if his ship becomes a total wreck—I mean that as a general rule the policy puts a very ample value on the ship, does it not?—I do not think that is so in all cases. In some cases we have full values, in other cases we have moderate values, and in other

cases we have low values. I think the rates are fixed accordingly.

1809. We have had it suggested by some witnesses that the shipowner—without imputing to him misconduct at all—never makes so profitable a venture as when he loses his ship entirely?—I think that frequently is the case, but I do not think it is by any means always the case; in fact, I know of a recent case in which the value of the ship is not equal to its selling value to-day. I do not think the shipowner can be said to have made a profit in that case.

1810. We have had it in evidence from underwriters that during the Russo-Japanese war merchants and shipowners insisted on carrying out their venture, even when the risk had become so great as practically to be a certain loss, and even when the underwriters made very high offers indeed to them to abandon the venture. That must have meant that they were going to make a profit out of the total loss, must it not?—No doubt they were very fully insured in those cases.

1811. And therefore they became reckless as to whether the vessels were lost or not?—Probably; or it may have been the cargo in those ships—probably more the cargo than the ship. The cargo was very largely insured in those cases, I believe.

1812. In the cases of which I am speaking I am not talking of a loss involving loss of life?—I understand.

1813. There was merely a loss of property?—Quite so. I think the cases of which you speak had been got out as far as Shanghai, for instance, and at great expense. To have stopped the venture there would have meant a loss, no doubt, on those cargoes. It was better for the merchants that they should go on and be captured than that the voyage should have ended at Shanghai.

1814. Supposing we were a belligerent, it would be contrary to the public interest, or it might be contrary to the public interest, that a voyage involving such risks as that should be pursued?—Yes.

1815. It might practically lead to making a present of ship and cargo to the enemy?—Quite so.

1816. Would not the risk of that be much less if all that the shipowner recovered was the actual value of his ship, instead of, as at present, whatever value had been agreed in the policy, which might be a value in excess of the actual value of the ship?—Yes; but there would be great difficulty in determining the actual value of the ship. How could it be determined?

1817. Would you have much difficulty in appraising the value of any ship now. You have access to Lloyd's Register, and so on?—I do not think that would be sufficient to enable one to appraise the value of a ship. I think we should have to go to a professional valuer of shipping and get his certificate

1818. Could you arrive at a workable rule by taking the cost price and allowing a fixed depreciation, for instance?—You might get at a rule in that way, I think.

1819. If you take the cost price and allow the same depreciation as is allowed for income-tax purposes, do you think that would be a fairly safe rule?—I am afraid I do not know what is the depreciation allowed.

1820. (*Sir James Mackay.*) Sometimes vessels may rise in value considerably after they are built. For instance, there has been a rise of 25 per cent. in the last two or three years, has there not, which rather works off any depreciation?—Yes; and then, on the other hand, some steamers are depreciated almost before they are put into the water.

1821. (*Chairman.*) You said, in answer to one of my early questions, that your association was not necessarily opposed to any scheme that could be devised?—That is so.

1822. Though they objected to both of these schemes?—Yes.

1823. Can you explain to us what you think might be done usefully?—I think, as I said before, that if the Government are going to pay somebody they had better pay the man who gets the food into the country.

1824. Would you give a bounty on arrivals?—Yes. It might take different forms. It might take the form of a refund of his war premium, or a refund of a certain amount, so that he would know he could count on getting something upon getting his cargo in. I think that would all tend to reduce prices, if it were known that such a rebate would be made. I have not thought the scheme out thoroughly, but I have no doubt it could be done.

1825. I take it that on the whole your association sees no reason for the State to interfere?—I do not say that they see no reason, but they see no advantage in these schemes. They do not think that State interference in this way will attain the object which we think the Government has in view.

1826. Would you still advise us to attempt to work out a scheme such as you have suggested of some bounty or some payment on arrivals, or would you say that upon the whole you think we might very well leave things as they are to private enterprise?—Personally, I think a scheme of bounty on arrivals is very well worth consideration, because I think that would do more by a great deal to get cargoes in and to keep the ships at sea and to keep the ships from being captured. I think that is what you want. If you can keep the ships from being captured, the ships will be kept at sea, and British trade will go on. After all, it all comes to an adequate Navy under any circumstances. If the Navy is adequate, and if communication between the Admiralty and underwriters is good, premiums will be kept at a moderate figure, and there will not be that fear of captures which will really send prices up more than the actual captures themselves. Though some cargoes may be captured at first, the trade will find other channels. If it is interrupted by the captures at the beginning of the war, it will find some other channel into the country, and the country will not seriously suffer merely from the few captures at the commencement of the war. No doubt it will suffer to some extent, but it will not be a question of starvation, I think.

1827. It is not so much the actual loss which has been suggested to us as the difficulty arising from the fear of loss, as you put it?—Exactly; it is the fear and the uncertainty that will cause the prices to rise.

1828. It has been put very strongly to us by other witnesses that the effect of a few captures, such as one must contemplate as inevitable in the case of a great war in the early stages, would be so great in creating a panic as to raise rates to a prohibitive amount, or perhaps even to make it impossible to insure vessels at any rates at all?—I think we do not share that view in Liverpool.

1829. (*Captain Ottley.*) Could you give us any idea what you think would be the best kind of line the Admiralty should take in communicating with shipowners. What should be their channel of communication in the first place?—I take it that Lloyd's would be the natural channel. The Admiralty would wish naturally to keep everything as confidential as possible, and they would not want information of that kind to be sent out broadcast. If an arrangement were made—which, no doubt, could be made—by which Lloyd's could pass on those communications to other underwriters in the country, I think that would have the effect of keeping premiums at a moderate level. I am sure underwriters on their side would give the Admiralty all the information as to the position of ships and so on that they possibly could.

1830. Obviously, if the Government gave no kind of compensation, no sort of guarantee, the utmost that the Admiralty could do would be to give advice—they could not give orders?—Quite so.

1831. I think probably that is the utmost which the Admiralty will attempt to do; they will merely advise, and they will from time to time give information; and with that you agree?—Quite so. Underwriters would then find out whether the shipowner intended to accept the advice of the Admiralty or not.

1832. I think I quite understand that your view about the two Schemes A and B is that they are both objectionable from the broad point of view that the only people who will receive compensation will be the people who have failed to bring their cargoes in?—That is so. I think that the A scheme will really bountify the shipowners at the expense of the taxpayer.

1833. As an alternative to those two schemes, to both of which you see objections, you think it might be possible to pay bounties upon cargoes upon arrival?—I do not suggest that as an alternative scheme. The Chairman asked me if we were opposed to any scheme. We are not opposed to any scheme. It is quite conceivable, I think, that some scheme might be devised which we should think good; and I may say that I am trying to give you the opinions of Liverpool underwriters as good citizens, and not to put forward what is for our own individual profit and advantage.

Mr. J. T. Binning,
25 Mar. 1907.

1834. From that point of view—that is, from the point of view not merely of individual private advantage, but from the point of view of the nation at large, I was going to ask next if you could form any idea—and, of course, I admit it is only the vaguest possible idea that we can any of us form—of what sort of numbers of ships would be captured in a great naval war? For example, we might imagine a thousand ships leaving within a given period of time for British ports; can you give us any idea what proportion of those ships would be likely to be captured?—I do not see how we can give you any idea, because it must depend so entirely on the particular circumstances and on what happens in the Channel. We have large sea room all round the west coast of Ireland, and we have many ways of approaching the different ports in England; but no doubt a very great deal would depend upon what happens in the Channel and in the immediate vicinity of the islands.

1835. If we take a case, which I think would really be an extreme case; if we are satisfied that in a great war of that kind, say, 100 out of 1,000 cargoes would fail to arrive, which I think would be a very large proportion?—It would be a large proportion.

1836. Then the bounties would be payable upon the remaining 900 that did arrive?—Yes, if war premiums had been paid upon them. But I think these schemes assume—and perhaps the Royal Commission assumed—that war premiums would be paid upon the whole of British shipping. Such would not be the case. War premiums would only be paid upon those ships which were in the zone where they were likely to be captured. In these other wars we have had shipping belonging to the belligerents in different parts of the world on which no war premium was paid, because they were not within the danger zone, and there was no chance of their being captured.

1837. (*Sir Thomas Glen-Coats.*) In regard to the second point in your *précis*, namely, "That the cost of war insurance is not the only factor in the increase of cost of food and raw material in time of war, and that there is no evidence that it alone would be a serious deterrent to the importation of adequate supplies." Do you refer there to the bounties on ships bringing their cargoes safe to this country, or to other things?—When I refer in that paragraph to the war premiums not being the only factors, I have in mind other factors, such, I take it, as the usual market devices for putting prices up on the apprehension of war or on the actual commencement of war. Markets are always affected by such apprehensions.

1838. As regards the refunding of premiums, would you pay those on outward-going ships as well as on ships that are bringing foodstuffs from abroad into this country?—Yes. I think the outward cargoes have to be taken into consideration as well as the imports, because we must have something to pay for our imports.

1839. Do you suggest, then, that the same amount might be paid on ships carrying our manufactures abroad as well as on ships bringing foodstuffs and raw material to this country?—Yes, if they were in danger of being captured, of course.

1840. I think you said there would be a large proportion of ships which would not be insured against war risks, because they would not come within the danger zone?—Yes.

1841. Would not all ships bringing foodstuffs and raw materials to this country and carrying manufactured articles from this country necessarily come within the war zone, either coming in or going out?—I think that would very much depend upon what happened in the actual war.

1842. You do not think they would necessarily come within the war zone, then?—We know absolutely nothing as to what would happen. It is difficult to conceive what would really happen in the case of a war against a large naval power; and so it is very difficult to answer a question of that kind.

1843. My idea was that these ships would be bound to come within that zone, and therefore the owners of all ships bringing goods to this country, or carrying manufactured goods from this country, would require to be paid a premium if they had got their ships safely through?—I do not think that. I think it has only an indirect bearing on the food supply. We should require to encourage a certain amount of exports in order to pay for our imports, and to that extent it might be desirable to give a bounty to the outward vessels as well as to the homeward ones. But our shipping is all over the globe, to all countries, and on all seas, and I cannot imagine that it would all be in the war zone at once, or that more than quite a comparatively small portion of it would. I think it is very improbable that we should be at war under such conditions that more than a limited amount of our tonnage would be in serious danger.

1844. Would you extend the premium to ships sailing under a foreign flag?—No, certainly not.

1845. But if they were bringing foodstuffs to this country?—If they were bringing foodstuffs to this country they would not be under the disadvantage of a war premium, or at all events, it would not be a very high one in their case.

1846. We have had evidence to the effect that there is no great extra safety in bringing foodstuffs in a neutral ship?—That might depend upon what was decided to be treated as contraband of war. It might be that foodstuffs would be considered contraband by our enemy, because, of course, our existence here depends upon them.

1847. May I take it that if these premiums were paid to owners of ships bringing their ships safely through they would be given on the understanding that the State does not either insure these ships or give an indemnity to these ships; but that this scheme takes the place of the others?—Yes, such a scheme would take the place of the others; but, as I have told the Chairman, I have not thought it out. I think, however, such a scheme might be devised.

1848. (*Mr. Lindley.*) In the last paragraph in your *précis* you say that the schemes before the Committee would be commercially unworkable; I take it that that is chiefly on the ground of expense?—It is largely on account of the expense, because I take it that the Government, given sufficient money, could do anything.

1849. Supposing Scheme A were adopted, and that the shipowner and the merchant were practically only indemnified for the actual value of the goods or the ship, how then would the Government be incurring an expense equivalent to, or more than the war premium which would be paid by the shipowner or merchant in ordinary circumstances?—I do not think it would do so; but, as I think, the delay and other things will have to be taken into account in that case, because otherwise the scheme will not be adopted by shipowners.

1850. Do you think it would be impossible to arrange in such a way that any committee which shall be appointed will be able to get claims passed and settled within a fixed time, so as to satisfy the shipowner and the merchant?—No, I think not.

1851. At the present day is it not the fact that most of the insurances which are taken out on steamers for time do not cover war risks?—That is so.

1852. Supposing a war broke out, those vessels would have to be insured against the war risks on separate policies, then?—Yes; or by the same underwriters.

1853. It is your experience that that is very often done by the same underwriter?—Usually the shipowners, as far as Liverpool shipowners are concerned, go to their own underwriters first. If those underwriters quoted a higher premium than the London underwriters, no doubt the London underwriters would get the risk.

1854. Assume for a moment that it is the case that the two risks are separated, do you consider there would be any difficulty in determining where the loss would lie?—There might be serious difficulty in some cases, I should think.

1855. Have you ever come across a case yet?—No; because we have not really had any large experience with war risks.

1856. There was one case in the Russo-Japanese war, was there not?—It did not come within my knowledge.

1857. You do not know of it?—No.

1858. As a matter of fact there was one, the "Claverton," and the underwriters on the hull paid for it, and the vessel was found afterwards ashore. In reference to your remark with regard to delay or demurrage, I take it that you did not mean that under an ordinary policy covering a war risk you thought delay or demurrage would be paid for by the underwriter?—No.

1859. What you implied really was that if the shipowner came into this scheme that would have to be considered, so as to give him an inducement to come in?—Quite so.

1860. With regard to the question of fixing values in the case of a loss, you have had a good deal of experience of general average-adjusters, have you not?—Yes.

1861. Have you found any difficulty in agreeing to the values which have been assessed and taken either on ship or goods?—No, we have not.

1862. That has been carried out for a good many years with very little trouble, surely?—Yes.

1863. Could not a similar principle be applied here?—I think you would have values put up very largely on the commencement of a war, and that would lead to questions which do not exist now.

1864. You have read these two schemes through. I will leave the ship for a minute, and ask you whether you have noticed the value that is mentioned for the cargo—namely, the value of the cargo at port of shipment, *plus* insurance and the freight to port of destination. Would there be any difficulty in fixing that?—No; I take it there would be an invoice for that cargo.

1865. And the shipping documents would probably be hypothecated?—Probably, I should think.

1866. Does that not get rid of the difficulty then?—If they thought they were going to be paid by the British Government, the market would put a pretty good value on produce coming through in that way.

1867. If the merchant pays it, surely that is the value, is it not?—Yes.

1868. (*Chairman.*) You note that it is the value at the port of shipment?—Yes.

1869. It is not a speculative value which it might have on arrival, but the sum actually paid at the port of shipment?—Yes.

1870. (*Mr. Lindley.*) *Plus* the cost of getting it to this country?—Yes. But in these days of cables it would be known perfectly well in New York, for instance, what the position is over here, and a very high value would be put on cargoes that were coming here and were likely to be in danger of being captured.

1871. Because of the particular zone or district it has to pass through?—Yes.

1872. That would apply, surely, to any cargo that is purchased in any neutral country for the purpose of being carried to this country, where they have got a danger zone to pass through, whether it is purchased or whether there is an indemnity or whether there is not?—Yes; but I think if they thought they were going to be indemnified——

1873. They would stick the value up higher?—I think that is one of those factors which are mentioned in the second paragraph in the *précis*, which would put the price up in time of war. It is due, to a large extent, to the fear of capture.

1874. That idea of fear is the great thing that this scheme is suggested to avoid, in order to prevent a panic rise in prices?—Yes, but we do not think that it will have that effect. We think the best remedy for that is an adequate navy.

1875. In reference to the cargo stopped at Shanghai in the Russo-Japanese war, you mentioned just now that a lot of shipowners went on in spite of the requests of their underwriters. Is it not a fact, however, that a very large proportion of them did not go on, but accepted settlements made by compromise with the underwriters?—I do not think I said they went on.

1876. I rather gathered from your reply to Mr. Chamberlain that a large number of them did go on?—I do not think I said so. I said I thought the goods, having been got out so far as Shanghai, at great expense, it was natural that they would prefer to go on; but, as a matter of fact, I believe a lot of those insurances were cancelled.

1877. That is what I wanted to get at; I rather gathered from your reply that you thought a large number of them had gone on with an almost dead certainty of capture; whereas, as a matter of fact, I believe, much the larger portion of them were settled by compromise?—I think so; as far as my knowledge goes.

1878. (*Mr. Beauchamp.*) You are of opinion that there will not be a great rise in war premiums on the outbreak of a war?—I do not think there will be an undue rise. I think underwriters will wait and see what is going to happen before asking excessive rates.

1879. I think you said that the rate during the Japanese war on goods going to Japan, never rose to above a very moderate figure?—Quite so.

1880. Was that not because those goods were shipped in neutral vessels and not in belligerent vessels?—I was speaking of Japanese vessels. The rate on neutral vessels was quite nominal, too; but, as I say, I was speaking of Japanese vessels which were running from the west coast of North America to Japan, carrying flour across to Japan. Those risks were placed at 20s. to 40s. per cent., which is quite moderate.

1881. All through the war?—At the commencement of the war, when it was undecided which power was superior on the sea. Later I think they fell away to quite nominal rates, when it was found that they all got in perfectly safely.

1882. But then it was generally known that the Russians had only a very few cruisers out at that period of the war, was it not?—At the commencement of the war there was considerable fear of the captures of those cargoes going to Japan.

1883. But the fear was only measured by a premium of 20s. to 40s. per cent.—and not more than that?—Yes. I think there were only one or two captures on the Russian side.

1884. If there were a good many captures of British vessels at the beginning of a war, do you not think that the premium would rise?—I think that would influence the rate very considerably.

1885. If the rate went up, we will say, to 15 guineas—or even 20 guineas—which is quite possible, is it not ——?—Yes.

1886. Then do you not think the market for war risks would be very restricted?—I do not see why it should be. Unless something of the same nature occurred here as did in the case of Vladivostock and the Russian fleet, I do not see why there should be any serious restriction in the market.

1887. Not even with a premium as high as 15 guineas, we will say?—No, not even with a premium as high as 15 guineas.

1888. You, of course, represent the views of the underwriters in Liverpool?—Yes, entirely.

1889. But it is quite possible that the directors of the companies, if they found there were heavy losses, might get into a panicky condition and insist that no more war risks should be taken?—Yes, I suppose that might happen.

1890. Do you not think it is quite likely to happen? It has happened, has it not? I do not say it has happened in Liverpool, but it has happened in one or two cases before?—I think it is quite possible, but I am afraid I cannot speak for directors.

1891. Because you are not a director of a company?—I do not represent a company, and therefore I can hardly speak to that.

1892. If there were no scheme of this kind, and the Admiralty were at any rate to tender advice, if they did not give instructions, do you not think that the underwriters would insist upon the shipowner and the master of the ship conforming to the advice or the instructions of the Admiralty under any circumstances?—I certainly think they would, but I think they would get a lower premium if they did.

1893. If they did not, then the premia would be put up?—Then the premium would be excessive, probably. No doubt it would be governed by that.

1894. You think the shipowner would not come into the scheme unless he was paid for his demurrage for delay?—I think not. I think that would be one of the considerations with him as to whether he came in or not. Another would be whether he would not get a settlement more speedily from his ordinary underwriters; and another would be whether the ordinary underwriters would not allow him to put rather a better value on than the Government would. No doubt the shipowner would have several considerations to think of.

1895. But the underwriter would insist upon the

Mr. J. T Binning.

25 Mar. 1907.

shipowner conforming to the Admiralty regulations, or would charge a higher premium; and would not the higher premium charged by the underwriter really come in in the place of demurrage and probably represent very nearly the same sum?—It might or it might not.

1896. If the underwriter said, "You will not come in, so I will charge you 10 guineas on a ship worth £20,000," that would come to £2,000?—Yes.

1897. Which probably would be quite as much as the demurrage would come to?—Yes, it might be.

1898. I did not quite understand who is to pay the premium under your alternative scheme, or suggested scheme. Who is to pay the premium for the war risks, do you contemplate the State paying it?—No.

1899. Then would it be the ordinary premium?—It would be the ordinary premium. I only suggested that it might be made in that form—that one form the scheme might take would be to refund the premium, or a part of it, to the merchant and shipowner, so as to reduce the excess part of the premium, so to speak. Supposing he had to pay 10 guineas per cent. while a neutral was only paying 1 per cent., he might be refunded 9 per cent. or the larger part of 9 per cent.

1900. Would that not rather tend to put the premium up than to keep it down? If the owner knew that he was to receive it back on arrival, it would not really matter very much what premium he paid; he would say to the underwriter, "I can pay you a good premium, because I am going to get it back again on arrival." Would that not rather tend to put the premium up?—It might have a slight tendency towards that. As I say, I have not thought out that scheme. It only suggested itself to my mind that if any bounty were to be given at all, it would be better to give it in some way upon the ships which actually got into port, and not upon those which are lost.

1901. But there is no inducement to the shipowner to lose his ship under B scheme because he is only going to get the exact value of his ship, and he would get no profit, you see?—That is so.

1902. The inducement to the shipowner to bring in his ship would be that the cargo, at any rate, would be sold at a handsome profit, and he would probably be paid something by the cargo-owner if he did get safely in?—I take it that you would have to return the shipowner his war premium, too, if you want to affect the cost of the produce eventually to the consumer.

1903. There is no incentive under this scheme for any man to throw his ship away, and there is every reason for him to get his ship in, because the owner of the cargo would get a big profit on the cargo which he got in, and would probably make an arrangement with the shipowner to give him something out of that profit if he did arrive safely?—I do not think that is our view in Liverpool.

1904. I rather gather from what you said that you thought that under either of those schemes—A and B—there would be some incentive to a man not to avoid capture?—Yes, and to take hazardous risks which he would not otherwise take. We think in Liverpool that that would be so under these schemes.

1905. And you still think so, even although the man is only to get the actual value of his ship?—Yes. We still think so, because no doubt he would get the full market value of his ship.

1906. The owner of the cargo is only to get the actual value of his cargo *plus* insurance and freight under the scheme; but if he arrives he will get a very big profit probably?—Probably he would.

1907. So that under all the circumstances it would be to his advantage to get in?—Yes, assuming that it is the merchant's cargo bought abroad. A good many cargoes are at present sent into this country to order, and are the property of foreigners, and not the property of British subjects.

1908. (*Sir James Mackay.*) Do you think that any scheme under which the shipowners were to be taxed, say from the beginning of 1908 or 1909, in order to provide a fund to pay for losses during the time of war, would be welcomed by the shipowners?—Not being a shipowner, I am afraid I cannot say, but I should doubt it.

1909. You propose to give this bounty to the shipowner as well as to the cargo-owner, do you not, if he arrives safely?—I should think any scheme would have to provide for that.

1910. Why should the cargo-owner get it? He has had nothing to do with getting the ship into port?—He has had to pay his war risk premium, and your object is to keep prices at a reasonable level.

1911. The Government would then be practically paying the war risk premium?—Virtually.

1912. To the underwriters?—In a way, yes.

1913. (*Sir George Clarke.*) Did the members of your association take war risks on a large scale during the Russo-Japanese war?—Yes, they did, on a considerable scale.

1914. I think you told us that the competition of underwriters can be relied upon to keep prices down. For instance, take that high rate to Vladivostock, 30 to 40 guineas; was that a rate which had been kept down by competition?—I take it so entirely.

1915. You mean that it might have risen very much higher if there had not been competition?—As a matter of fact, it did not pay. The underwriters who wrote those risks lost money very largely.

1916. We have been told that if there were very heavy losses, the majority of underwriters would close their books at once, and the ships affected would not be insurable at all. I take it that you do not hold that view?—We do not hold that view in Liverpool.

1917. Do you think that, especially in the first few months of the war, there would be any chance of the rates in the ordinary market being kept steady?—I do not see how you could keep them quite steady. I think they would vary from time to time, according to events.

1918. Then you do admit the possibility that the fluctuations might be sudden and violent?—Under certain circumstances, of course, they might be more violent than under others; on the other hand, unless anything very startling happened, the fluctuations would not be very serious.

1919. But in war things that are startling frequently do happen?—Yes, they do.

1920. And do you not think that if things startling do happen, they would be accompanied by violent fluctuations in the insurance market?—Yes. If a large number of ships were captured, the rates on ships nearing the danger zone would naturally rise to a very high figure, but only on ships nearing that position. Ships farther off, and not likely for some time to be in the war zone, would still be unaffected by that.

1921. That is, assuming, of course, that the enemy was not able to effect captures in distant waters; and that is not certain?—I take it that it is most unlikely that we could be at war under such circumstances, that our tonnage should be in danger in all parts of the globe. It would only be in a few places where probably there was any great amount of danger.

1922. But you do think, if it did come about that the fluctuations were violent, leaping from day to day, that would have a very serious effect on the commerce of the country during that time?—Yes. Of course, so much depends upon the actual position. We cannot quite conceive of anything so bad happening as to affect the whole commerce of the country. If it did, then, as I said before, I am afraid credit would be so much impaired that insurance would not matter, as there would be nobody to handle the cargoes.

1923. Do you think that captures in one part of the world would not affect the insurance market in other parts of the world?—I do not think they would at all.

1924. Have you formed any idea as to what rates of insurance would really be so great as to prevent ships going to sea at all? What would you put down as a prohibitive rate?—I do not know that we can put anything down as a prohibitive rate, because the rate would be taken by the shipowner along with his other expenses, and added to what he would be willing to undertake the risk for, or it would be added to the ultimate cost of the produce.

1925. At any rate, any conceivable rate might not suffice to stop all the operations of commerce, because commerce might still stagger along under it?—I think, as I said before, that war would no doubt stop up certain of the usual channels of commerce for the time being; but that commerce would find other channels at once. The first effect of any captures would be to divert the trade into some slightly different channel.

1926. (*Sir George Murray.*) As, for instance, under a neutral flag?—It might be that, or it might be a different trade route. We have a great many trade routes open to this country, and if one trade route were

unsafe, commerce would naturally be driven to other trade routes.

1927. (*Sir George Clarke.*) If Scheme B was so framed as to insure a maximum rate of not more than 2 per cent. or 2½ per cent., which you said was the rate from the United States to Japan, do you not think that would be a great advantage?—It would.

1928. And if anything could be done to insure the shipowner against rates above that figure, it would be a gain?—Yes, it would be a great gain to the shipowner, of course. I think, personally, as an underwriter, that it would be very advantageous to the underwriter, as it would relieve him of all the bad risks.

1929. Then when the market rates drop below the fixed State rate, the underwriter would come in and do all the business, of course, naturally?—The shipowner, or the merchant, if he had a moderate rate quoted to him by his underwriter, would naturally prefer to do his insurance in that way. It would save him a good deal of trouble, and save all questions and any possible delays.

1930. So that Scheme B might just do for the critical period?—Yes.

1931. And afterwards natural methods would assert themselves?—Yes.

1932. And you think that would be a gain?—Yes, I think it would be.

1933. When you say that Schemes A and B would be commercially unworkable, do you mean that they are bad business, or that the machinery required would be so unwieldy as to be impracticable? Which point of view do you take?—I take it that what we mean by their being commercially unworkable is that they would, in the end, cost more to the consumer—that they would be more expensive.

1934. To the country at large?—Yes. They would be more expensive, I think, to the country at large.

1935. That is by reason of the large machinery which you think it would be necessary to set up?—Yes

1936. Supposing there was no very large machinery to set up, your objection would then be modified, because it is rather one of expense, is it not?—Yes, it is largely one of expense.

1937. Under Scheme B, if the State fixed its schedule of rates in a clear form, do you think all the actual business of insurance could be carried on by the underwriters acting on behalf of the State on commission?—That would mean making an arrangement with the underwriters. I have no doubt something of that kind could be devised.

1938. You do not think that is absolutely impracticable?—No, I should think not.

1939. With regard to your suggestion that there should be a bounty on arrivals in this country and also on our exports, that, of course, would not be any help to British commerce between non-British ports nor to British commerce between British Colonies?—No, it would not.

1940. All that section of our trade would not be helped in any way at all?—No, it would not; but I take it that these schemes refer specially to the supply of food and raw material to this country in time of war.

1941 You were not thinking of it as applying to British commerce all the world over?—Not at all—only to those two particular things.

1942. I suppose you would not go on paying these bounties all through the war? You would not go on after the scare, and after it was shown that the country was perfectly safe?—No, certainly not.

1943. The Government would be able to put the stopper on at once?—I should imagine so. As I have already said, I have not considered this scheme, and I have not thought out how it would be practicable, but I can quite imagine it possible to devise a scheme that would be effective.

1944. I may take it that your general view is that it is unnecessary for the State to do anything, because there is no danger of a panic or of the stopping of commerce due to high insurance rates? That is your general view, is it not?—That is my general view.

1945. And the view of Liverpool?—Yes. My general view is that if the State interferes in this form, it will be more or less at the expense of the consumer.

1946. You rather think it is not necessary for the State to interfere, because the ordinary machinery will do it all for the State?—I think the ordinary machinery is sufficient. *Mr. J. T. Binning.* 25 Mar. 1907.

1947. (*Sir James MacKay.*) You were speaking of the Japanese steamers running between North America and Japan during the war; you know, I suppose, that the Nippon Yusen Kaisha stopped altogether running to this country?—Yes, I am quite sure of that.

1948. They had to withdraw that line altogether the moment the war broke out?—That was on account of the Russian cruisers.

1949. They would not have been safe from the Russian cruisers in the Mediterranean or in the Red Sea, would they?—Possibly not, because there they would be so far away from their own vessels.

1950. They had steamers running into Bombay from Japan, and they had to stop them too; in fact I do not think any Japanese steamers came west of Singapore?—But there has been no loss to Japan of those steamers. The owners did not put them under a neutral flag.

1951. No, they did not; that is quite true?—I take it that in a case of that kind the Government of the country is always glad to have a number of merchant steamers that it can take up.

1952. But still they were driven off that line?—Yes, but they would find employment in other ways, no doubt.

1953. (*Chairman.*) I want to read to you, if you will allow me, some evidence we had the other day from an underwriter, and to hear your view of it. I put to him the question: "To begin with, perhaps you would tell me why you think a scheme desirable?" and I will read you some passages in his reply. He said, "I am of opinion that in the event of the outbreak of war the present market for insurance of vessels and cargoes against war risks would shrink up. I am of opinion that prior to war, in the case of rumours or anything of that sort, there is a very large market, but after an outbreak, and in the probable event of captures, that market would almost entirely shrink up, and the few underwriters or companies engaged in the business would put the rates up to an absolutely prohibitive size for the carrying on of commerce." You do not share those apprehensions at all?—We do not share those views in Liverpool.

1954. The witness went on to suggest, as you have said, that there would be risks which would always be very slight risks and easily covered; and he also suggested that there would always be certain danger zones, and that within those danger zones the risks might rise to 20 or 30 guinea risks. Then I put to him the question: "It would be difficult to find underwriters to take the risk at that rate?" and he said, "You could not place sufficient even at those rates. There would be only a few groups who would go into it." That is not your view in Liverpool?—No, that is not our view in Liverpool.

1955. Of the firms represented by your association which took war risks at the beginning of the Russo-Japanese war, did the great majority of them continue to take war risks right up to the end?—They did, I think, at all events up to the fall of Port Arthur. Naturally, no Russian risks were taken after that.

1956. But up to that point the great majority continued to underwrite both Japanese and Russian risks?—Yes. The companies who had been taking those risks went on doing them until the fall of Port Arthur, I think.

1957. Was there no marked shrinkage in the market on that?—I do not think so. There was always quite a free market on the Japanese risks. I think that a great deal must depend upon our showing superiority at first, if possible. If we do that, there need be no fear of high war rates at all.

1958. (*Sir James MacKay.*) Of course, if we lost command of the sea, we could not insure at any price?—Naturally.

1959. You admit that, of course?—Naturally.

1960. (*Sir George Clarke.*) But there must be some period—you must give time for naval superiority to assert itself?—Yes.

1961. And that is the critical time for insurance?—Yes.

1962. That might be weeks or months, but time would be required, undoubtedly?—Yes.

TENTH DAY.

Tuesday, 16th April 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*)

The Right Hon. Sir R. B. FINLAY, K.C., G.C.M.G.
Sir THOMAS GLEN-COATS, Bart., M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Captain C. L. OTTLEY, R.N., M.V.O
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. ARTHUR LINDLEY.
Mr. GEORGE H. DUCKWORTH, *Secretary*.

Mr. CHARLES WRIGHT, called and examined.

Mr. C. Wright.

16 April 1907.

Mr. Wright, in a preliminary memorandum,* had submitted:—

(1) That it is not desirable that the State should make good the losses referred to, but that in case the State should decide to take such risks, premiums calculated to recoup the whole cost should be charged.

(2) That under any scheme business could not be carried on in peace as in war, owing to Admiralty restrictions.

(3) That State insurance would not prevent the increased prices of commodities in time of war, such prices being governed by the relation of the demand to the supply available.

(4) That gratuitous indemnity would not secure the arrival of supplies.

(5) That safe arrival depends solely upon the acquisition and maintenance of the command of the sea, and that occasional captures are best dealt with by ordinary insurance.

(6) That the Russo-Japanese war has shown that the supposed immunity of neutral vessels is illusory, owing to the enlargement of the scope of contraband, and that little protection is to be expected in Prize Courts where the wrongdoers are both judge and defendant.

(7) That although State insurance might allay anxiety during negotiations, it may be better that such anxiety should exist, since it is a factor in favour of peace.

(8) That experience has not shown that private insurance is unduly expensive.

(9) That the payment of a premium is a serious tax on the fraudulent, and that insurance in the ordinary way tends to prevent fraud and loss.

(10) That even if qualified men could be obtained and paid for in time of war, when all would naturally be fully occupied, they would not have the same inducement to exact an adequate premium as they have under present conditions.

(11) That State insurance might result in the indemnification of aliens, or even of the enemy.

(12) That Scheme "A" would be impolitic and inequitable, and that if Scheme "B" were thought advisable,

(a) the loss to be covered by the indemnity should be defined by a new and special form of policy, since the present war risks policy is obsolete and unsatisfactory;

(b) the premium should be fixed for each risk at the time when the risk is proposed, and the rate should be commensurate with the risk;

(c) all values should be agreed beforehand;

(d) claims should be examined by well qualified and paid officials, and the decision of the Board should be subject to appeal to the ordinary tribunals.

(13) That it might be possible for the State to guarantee, in time of war, the solvency of existing companies and underwriters, though it is not a scheme to be recommended.

1963. (*Chairman.*) You are an insurance broker, and a member of Lloyd's, I think?—That is so.

1964. A director of Henry Head and Company, and Deputy Chairman of the London Salvage Association?—I am.

1965. You have seen the terms of reference to this Committee?—I have.

1966. What is your general opinion upon the subject referred to us?—My opinion is that the State cannot usefully intervene in the matter at all, and that if it decided to intervene it should do so upon the second plan—namely, by means of a national guarantee which is paid for, not a gratuitous plan.

1967. I will come later to the plan and your reasons for that, but I would like to ask you first some questions on the general subject. It was suggested that the State should make good the war losses at sea or give a guarantee in some form or another with a view of securing that the business of the country should go on, as much as possible as it would in time of peace, during a great war?—Yes. That is in the form of a question, I presume. That is what I understood to be the motive that governed those who originally proposed this, but I see by the plans which are now submitted that shipowners are to be placed under Admiralty direction, and therefore that basis of the scheme is given away at once, and it is admitted that the business of the country could not possibly go on in time of war as in time of peace. That provision seems to me to be absolutely necessary, and any scheme of indemnity that did not contain that, I think, would be extremely impolitic.

1968. No doubt, whether there is a State guarantee or not, there would be some interference with the ordinary course of trade. But what has been feared is that the insurance might rise to such a point that ships could no longer be profitably employed, and cargoes of necessaries in particular could no longer be imported at reasonable rates. A scheme of indemnity might meet that, even though some conditions were necessary in war that are not enforced in time of peace, do you not think?—No doubt a scheme of indemnity would induce shipowners to send their vessels to sea at a time when without such an indemnity they would not send their vessels. That I admit, necessarily.

1969. What do you anticipate would happen to our own shipping on the outbreak of a great naval war in which we were a belligerent?—That seems to me to be more a question for a naval officer to answer than for

* *Vide* note, p. iii.

an insurance broker. My hope and my expectation would be that our Navy would do what it is expected to do, and that it would so far dominate the situation that it would be possible to carry on business, not, of course, anything like under peace conditions, but it would nevertheless be practicable to carry it on. I should anticipate captures would take place, especially perhaps in the early stages, but I should hope that our Navy would collar the navy of the enemy, and that captures would cease, or that they would at any rate be reduced to a relatively small number, such as would readily be met by the ordinary system of insurance.

1970. Assuming that our Navy was in a position to obtain command of the sea and to keep it, there might, as you say, in the early stages of the war, be considerable captures?—Just so.

1971. What effect would they have, do you think, upon the market for insuring war risks?—Undoubtedly a premium would have to be fixed reasonably commensurate with the percentage of loss that had occurred. If the percentage of loss were small the premium would be, I think, moderate. If the percentage were heavy the premium I have no doubt would be very heavy.

1972. It has been suggested to us by other witnesses that a few captures in the early stages of a war might put up rates out of all proportion really to the permanent risk?—Of course, it is very much a matter of imagination. My experience does not confirm that. Experience of wars in which we have not been engaged does not confirm that. On the contrary, it seems to me that the competition of underwriters tends to depress rates below a remunerative level.

1973. May I ask you at this point is the market for war risks a large one?—Yes, I think one may say it is a large one. It is not so large as the market for general insurance, and as the risk intensifies, as it becomes more onerous, I think the market tends to be restricted. The greater the risk, I think, the smaller the market.

1974. One witness said to us the other day that in his opinion if there were a few captures at the outbreak of war the market for war risks would shrink up altogether. Do you concur in that view?—No, I certainly do not. I think, however, that if the captures were, for instance, accompanied by a naval defeat, and if there were indications that the British Navy was not likely to effectively protect our commerce, rates would probably go up enormously, and the market would be greatly restricted—that is, there would be a large number of underwriters who would keep out of the business altogether.

1975. But assuming that the Fleet was undefeated and that there were indications that it was able to maintain supremacy on the sea, although not to prevent all captures, do you think the market would be sufficient to cover the whole of the British Mercantile Marine against war risks?—I think so.

1976. That would be a very much larger war risk than any market has ever been asked to take, would it not?—Yes, a very much larger risk than it has ever been asked to take, because we have never been engaged in a war when our Mercantile Marine has attained to anything like the value that it now has. But, on the other hand, since the time when we were engaged in war the insurance market has very much increased. Lloyd's is very much stronger than it ever was. There are more insurance companies than there were at that time. At the time of the Napoleonic wars there were only two insurance companies, and Lloyd's was a comparatively small institution.

1977. So that in your opinion there would be no difficulty in placing, under such circumstances as we are considering, the war risks of the whole of the Mercantile Marine, and of each individual venture in it, however large that venture was?—No, I cannot see myself the smallest difficulty. Assuming the British Fleet maintains a substantial advantage over the other belligerent, I cannot see why there should be the smallest difficulty in covering all the war risk—that is to say, in such circumstances I think the war insurance market would be about coterminous with the general insurance market. I think if the British Fleet maintained its position war risks would be a somewhat attractive form of risk. If the British Fleet were defeated, war insurance, I have no doubt, would become absolutely impossible.

1978. And, of course, under those circumstances it would not save the country?—It would not save the country, and I need not say the country would have to give in. That would be the long and the short of it.

Mr. C. Wright.

16 April 1907.

1979. I gather that in your opinion the price of commodities would not be seriously affected by war risks or insurance rates in war?—With regard to that I would be glad if the Committee would allow me to explain my view even more fully perhaps than I have in the paper I have submitted. It appears to me, if I may say so with deference, many advocates of national guarantee estimate freights and insurance and the price of commodities on an entirely false basis. They seem to suggest that a shipowner, for instance, when he is considering a voyage, says, "Well, this voyage will cost me so much in coals, so much in stores, so much in wages and provisions, so much in insurance, and the result is that a certain freight will pay me, therefore I shall take that freight." I submit that that is only true in a very limited sense. That is the minimum freight that the shipowner will take. When he can get a freight that will cover his expenses and give him some little return on the capital—I do not know that he is always very particular about the last item—then he says, "Now I can go to sea." But if he can get a bigger freight, if he can get double that freight, or three times that freight, he will take it, and, moreover, he will not allow his ship to go out until he lays hold of the maximum freight obtainable. Then similarly the importer of commodities considers the cost at the port of shipment, the freight, the premium of insurance, and the expenses at the port of discharge, and then he says, "If the price at the port of discharge is so much it will pay me to bring in these goods." But if, when he gets to the port of discharge he finds he can get ten times that price he is going to take that price. He is not going to take a penny less. Consequently I suggest that the price of commodities at the port of discharge does not depend upon what it has cost the merchant or cost the shipowner, but it depends upon the fact whether captures do or do not take place—that is to say, whether there is a scarcity in the supply or whether there is a superabundance in the supply. If there be a scarcity in the supply no scheme of insurance would ever prevent the price from rising. If there be an abundance, then however dear insurance may be the price must be depressed.

1980. I think I follow your argument, and I think on the whole I agree with you. But that does not exhaust the matter. If in consequence of war risks freights and insurance rise the minimum which will induce the shipowner to put to sea or the merchant to ship goods will rise, too?—True.

1981. If other witnesses were right that those risks will be apt to be believed very large, and that therefore the rise in freight and insurance will be very great, will there not be an artificial rise in the price of all commodities that might seriously affect the population at home, both as consumers and as workers of raw material which we have to import from abroad?—I do not think so. I really am strongly of opinion that the question of a rise or fall in prices depends almost solely upon whether the captures do as a matter of fact take place. Look at our experience in the Russo-Japanese war. It being supposed that the Japanese were paramount at sea, rates of insurance were absurdly small to Japan. It being, on the other hand, supposed that the Russians were weak at sea, rates to Vladivostock were gigantic, but at the same time insufficient. Why should we assume that British insurers would be in a worse panic about the fate of British vessels in a war in which we were engaged than they were in the Russo-Japanese war? It all depends, I submit, upon the question whether our fleet maintains its supremacy.

1982. Assume that the fleet does maintain its supremacy, then I gather that your opinion is that existing resources are quite adequate to deal with the risks, and there would be no advantage in the State taking them over?—That is so.

1983. Whereas if our fleet fails to maintain its supremacy no Government insurance would save our commerce or our shipping?—It would not; but, on the other hand, I think it would inflict grave injustice on the community, in that it would enable importers, merchants, and to some extent shipowners, but I think more largely the merchants, to pocket immense profits by virtue of their being relieved of the most serious element in their business, and at the same time being able to take advantage of the enormously

Mr. C. Wright.

16 April 1907.

enhanced prices consequent upon the scarcity following on captures.

1984. Assuming that state of things to exist for the moment, would not the result be that these high prices would enormously stimulate importation? I do not know whether you follow my question?—Yes, I think I do. Of course there would be a strong tendency to stimulate it, and in proportion as the goods arrived so would the prices be diminished. But it all hangs on that, whether as a matter of fact they do arrive.

1985. We come back to that, that if they arrive you consider a State guarantee unnecessary. If they do not arrive you consider a State guarantee will not help us?—Yes.

1986. It has been suggested that a State guarantee is necessary in order to prevent the disuse of British vessels, on the ground that under the present rules and practice of war the neutral is at so great an advantage compared with a belligerent. What is your view about that?—And consequently it is suggested that British vessels might be transferred to neutral flags?

1987. Yes?—In the first place it seems to me that the late war has shown that the supposed immunity of neutral vessels is largely illusory. They have been captured under circumstances that seemed to be totally devoid of justification, and yet no redress has been afforded. They have been promptly condemned, and it appears to me that with a neutral vessel the chances are not very superior to those of a vessel belonging to one of the belligerents. But the main question is, I take it, whether this supposed immunity would tempt British owners to transfer their vessels to neutral flags.

1988. Or to lay them up?—Or to lay them up. Of course it would not tempt them to lay them up if they could get them insured, and it appears to me that if they were to transfer them to neutral flags that transfer would be absolutely ignored by the other belligerent, and I think rightly so. It would be, as I suggest in my paper, too thin altogether. I think there were attempts in the Spanish-American war to transfer vessels to the British flag. It did not work in the least. Why should it?

1989. You are aware that our courts have recognised transfers under similar circumstances?—I am not aware of it, but I am quite ready to accept it and believe it. Our own courts have a most remarkable habit of being extremely tender to the foreigner. We can always invite a foreigner to come to a British court with the expectation that he will get more than justice done to him, for our judges, fearing a natural bias against the foreigner, sometimes seem unduly to favour him. But neither the Japanese courts nor the Russians appeared to share that view, and one may notice that the Japanese do not even show the smallest tenderness for their allies.

1990. So that substantially you think that the insurance on goods shipped in neutral vessels would not be greatly less than on British vessels?—I do not think so.

1991. It has been suggested to us also that the trade of the country is, so to speak, often fined unnecessarily by a panic which does not result in war, and that a scheme of national guarantee would save our traders that loss?—Yes, it is undoubtedly the fact that in time of stress war premiums are charged. They are not generally so heavy, I think, as to be any serious inconvenience to the commercial community, but still they do exist. I look upon them myself as being rather salutary, because so far as they tend to inconvenience (and they are an inconvenience contingent upon a war panic), and so far as they indicate that war would bring with it still greater inconveniences to commerce, they are an element and a factor in favour of peace.

1992. So that if there is some material loss you think that is counterbalanced by moral gain?—Yes, a moral gain that has a serious bearing on material things.

1993. I gather from what you said earlier that in your opinion the rates charged by underwriters have never been excessive for the risks that they have underwritten?—That I think would be rather too strong a statement, but I think that, generally speaking, underwriters have managed to lose money over war, and therefore, generally speaking, although there may be here an excessive rate and there one that is too little, on the whole I should say the rates are too small. They are not remunerative; the underwriters would be better without the business, I think.

1994. But you are not afraid that that experience of the past will deter them from undertaking the business again, and even undertaking it on a much larger scale, should occasion arise?—All I can say is that after the terrible experience that underwriters had in the Russo-Japanese war, as soon as the Russian fleet was substantially destroyed they started writing risks at nominal premiums, and suffered severe losses by one or two cruisers that went about sinking these steamers. Underwriters are a most sanguine race of men.

1995. I gather from the paper you have been good enough to send me that you hold there would be a great danger of fraud in any national scheme?—Especially with the gratuitous scheme.

1996. You will perhaps just explain why, although it is fairly obvious?—One of the strongest arguments for insurance in the usual manner is that such insurance prevents fraud, and it also tends to prevent losses. It prevents fraud because the payment of a substantial premium is a deterrent to the fraudulent. Take an example. Assume that a particular voyage is known by a swindler to be hazardous. It might suit that swindler to ship produce or goods, either worthless or of very inferior quality, and to declare it at a fancy value. Then, should it be captured, his documents will all be in order, and he will recover the declared value from the State. But if he were compelled to pay a heavy premium he could not afford to face the possibility of safe arrival. Frauds of this kind have been attempted in time of peace; some have been detected, some may have succeeded. But the State is poorly qualified to deal with frauds of this nature. I could give an example of fraud if you think it might be useful to the Committee.

1997. I think it might?—Some few years ago policies were issued to the extent of £70,000 on coin from Asia Minor, from somewhere in the neighbourhood of Beyrout, to Marseilles. It was explained that this gold would have to be shipped as iron, because there was a local law prohibiting the export of specie. After the interval of a fortnight or so the underwriters were informed that the whole amount of £70,000 had been shipped in a local sailing craft, called a "mabrouke," from some small port on the coast, I think it was Jaffa, to Beyrout, then to be transhipped to Marseilles, and it had unfortunately been lost in deep water with this sailing ship. A gentleman was sent out from this country to investigate the matter, and he was convinced by the evidence he collected that no coin whatever had been shipped on board this thing, and he came back and informed the assured that their claim was fradulent, and the policies were returned to the underwriters. The assured lost the premium, and nothing was ever paid. Now the premium in that case was a considerable one. It was 40s. per cent. But, of course, it was not so heavy as would be a war premium, in all probability. It depends entirely on the voyage. A swindler would naturally select a very hazardous voyage, and he would have to pay a premium which would be a very serious tax upon his resources. If he could get a gratuitous indemnity the temptation to a fraud of that kind would be very great. I do not think that particular fraud would commend itself to a trader on a national indemnity; but the fraud that I think would take place would be the shipment of inferior or comparatively worthless goods declared at a high value. There would be a severe deterrent if the man had to pay the premium on that, because there is always the fear that the thing might arrive, and then he would lose all his money that he had paid in the way of premium.

1998. That objection, of course, tells especially against a scheme of absolute free guarantee in which no premium is exacted from the shipowner or merchant?—Yes, it does. Then it tells also, I submit, against State insurance, because I do not think the State is ever likely to be adequately paid.

1999. That is to say, you mean that the State would never receive premia adequate to the risk that it undertook?—That is my opinion. I think, indeed, that the promoters of this scheme, even those who approve of selling the State indemnity, wish to sell it under cost price, as it were.

2000. I think that is so. The object of a State insurance being that rates should never rise above a moderate figure, it is obvious that if there is a State insurance the State must take many risks below their fair value?—Just so.

2001. Then you have suggested to me that it would be impossible to distinguish betwen the British subject and the foreigner, or even the enemy, as the owner of goods and shipping?—Yes.

2002. Would you explain to the Committee where you think the difficulty arises?—It is difficult to avoid indemnifying the foreigner or even the enemy. There is no inconsiderable number of British steamers owned almost entirely by foreigners. One effect of the development of joint stock enterprise is that the old rule of law prohibiting foreign ownership of a registered British ship is evaded. I do not know whether that is clear to the Committee, but if not I will be happy to enlarge upon it.

2003. I think so?—Again, commerce is international. Ownership of goods passes by endorsed documents, and if this custom be limited commerce would be paralysed. Any attempt to go behind the holder of bills of lading and policies would, I believe, be highly detrimental to business, and acceptance of the usual tests of ownership might obviously result in subsidising the enemy. Assume war with Germany. A German house instructs its branch in Argentina to ship grain in a British bottom to England. The insurance is effected in the name of an English firm; the bills of lading are handed to the English firm, who pay for the cargo; the Germans capture the steamer, the loss is duly collected, and the enemy has got the cargo as well as payment for it.

2004. Therefore, for these reasons which you have now given, you are wholly opposed to anything in the nature of Scheme A, one of the draft schemes which have been sent to you?—Yes, absolutely.

2005. You are, I gather, almost equally opposed to Scheme B?—I may say I am quite as thoroughly opposed to Scheme B unless steps are taken to charge a premium commensurate with the risk. It is only because I do not think it could be done effectually that I object to Scheme B at all.

2006. Why do you think it could not be done effectually? I, of course, admit that it is not the intention of the proposers of such a scheme that it should be done, but why could not it be done?—I do not think it could be done, for this reason. Let us assume that the State conducts its business in a thoroughly businesslike manner, and that for the purpose of this scheme it induces—I do not know whether it would be possible to induce, but let us assume that it was able to induce, and did induce—the most capable underwriters in London to come and conduct the business. Of course, there would be a grave difficulty about that, because it would be taking them away from their ordinary business and giving them a temporary employment, which would be no temptation to them. But assume that could be done, even then it seems to me that those men would be almost certain to quote lower rates and inadequate rates in consequence of their new position. In their present position if they do not quote adequate rates they have got the penalty of ruin hanging over them. In that position it would be a matter personally of no moment. I do not suggest they would not wish to do their duty, because they would wish to do their duty, but there would be the impression, What I have got to do is to facilitate the business of the country, and I cannot do that by charging 30 guineas per cent. The whole thing would become loose, and they would want to oblige this man and oblige that man, and it seems to me that none of the ordinary methods that govern a business man would operate in such a case. Therefore I say it is not possible.

2007. Recognising your views on the proposals in general, I would like to go behind them, and say supposing we nevertheless wish to recommend a scheme, have you any observations to offer on details, for instance on the clause which we have suggested as to the losses to be covered by indemnity?—With regard to that it should be remembered that the words which are proposed here, and which are taken from the policy of marine insurance, are not those commonly used to cover capture, but those which are used to exclude war risks from the ordinary marine policy. They are therefore more comprehensive than the current form of war insurance. I do not know whether that is quite clear to the Committee.

2008. Would you tell us in what respects they are more comprehensive?—The old policy of marine insurance contains a number of antiquated phrases which constitute the war risk covered. The risks covered are of the seas, men-of-war, fire, enemies pirates, rovers, thieves, letters of marque, and all that sort of thing. Those are the operative words which cover war insurance. Then comes along the underwriter, and he says: "Now, I want to exclude all that." He consequently uses words; he does not mind how inclusive they are; the more inclusive the better, and he uses the strongest possible phrases to exclude what he wants to exclude. He uses much better words, for instance: "Warranted free from capture, seizure, and detention, and the consequences thereof, or of any attempt thereat, and *all consequences of hostilities* whether before or after declaration of war." That is very inclusive. Now, if you turn that round about, and make what he has negatived affirmative, you are taking a great deal heavier risk than the marine underwriter takes. If he issues a policy he says: "I will cover all the risks which are excluded by those words from the ordinary policy." Therefore he simply refers you back to the ordinary policy to find out what is covered. Even so the policy is, to my mind, extremely unsatisfactory. All sorts of questions arise with regard to steam vessels and so on, which never came before our courts at the time we were at war, and the result is that nobody really knows accurately what the law is. But at any rate, there is authority for making this risk much more onerous than it need be for the due protection of the merchant and the shipowner. I would strongly, with respect, advise the Committee that should they adopt this scheme, they should have a thoroughly scientific war policy evolved; consult the best people, and get a new policy altogether, and have done with this absurd old war policy that we have got. To take an example of the inconvenience of our war policy. A vessel is captured, and at once news reaches the owner of the fact of capture. There is authority for believing that he is thereupon entitled to abandon to his underwriters, and to obtain payment of a total loss, although before perhaps a week or two has elapsed that vessel may be released. That is an absurd condition of things. That perhaps puts an owner in the position of receiving £40,000 for a vessel which is only worth £25,000, merely by the fact of its being for a short time in the possession of a belligerent That is a thing that ought to be corrected. Then questions of the cost of taking steps to avoid capture ought to be provided for in the policy, and strictly defined. Why should a man put himself to immense expense to avoid capture, and then not be recouped any of that expense? In certain circumstances that is possible under the present contract. There are many other points—I need not weary the Committee with them—which ought to be dealt with in a scientific policy of war insurance.

2009. You have not, I suppose, tried your hand at framing a scientific policy?—No, I have not. What generally happens is this, that a war comes upon us unexpectedly. We then naturally fall back upon the only document we have got. That gets used continually. Then people will not take anything else; they get nervous. They say: "Here is an alteration. I must go to my solicitor and find out what this alteration means; we must get the opinion of counsel," and so on, and then everybody says: "This is very unsatisfactory; we ought to alter it." Then the war finishes, and they say: "Oh, it is no use altering it now; the whole thing is at an end."

2010. As regards the value on which purchased indemnity should be claimed, have you any observations to make upon that?—It seems to me that it is very desirable that all values should be agreed at the time when the insurance is taken out. Those values would then form the basis of the premium, and the assured would have the satisfaction of recovering the amount upon which he had paid premium, and he would be deterred from insuring too much, if an adequate premium were charged; whereas, if the values were left open I think there would be a grave danger of their shrinking in the event of arrival, and appreciating very heavily in the event of a loss.

2011-12. And I gather that, to take first the case of the ship, in your opinion it is not really possible fairly to fix the value of the ship after the loss has occurred?—No, I would not say that. I believe it is quite possible. In fact, it is constantly done. After a collision, where the wrongdoing ship has to pay for the sunk ship, the value is proved, and it is proved fairly to the satisfaction of all parties.

Mr. C. Wright.

16 April 1907.

2013. But does not that then militate against your contention that it is necessary to have the value fixed beforehand?—No. You see you put to me a question of possibility and impossibility. The question of convenience or inconvenience is another matter, and I think it would be highly inconvenient, because the value which might satisfy a man in ordinary circumstances might not satisfy him in the event of war. It is quite conceivable that a steamer's value might be greatly enhanced at a particular time in war. Another thing is a man venturing upon a war voyage, I think, ought to know what will happen to him in the event of capture.

2014. He ought to have a certainty?—Yes, he ought to have a certainty. I think so. I do not think it would be inconvenient to the State either. If the State were not well advised, of course the whole thing would be disastrous; but if the State were well advised I do not think there would be any difficulty in fixing a proper value.

2015. Then may I, in conclusion, ask you one other question? Am I to take it that you regard the present situation and the present provision for insurance in case of war as the best that can be devised, or would you advise any steps?—I think, on the whole, I should say that I do not advise any steps at all. But I have ventured in the paper that I submitted to throw out a hint in one direction. In the event of war it would certainly be an advantage to the commercial community if they were quite sure of the solvency of their underwriters, and I have submitted that the State might be useful to the commercial community, if they were to guarantee the solvency of existing companies and underwriters, so far as war risks are concerned.

2016. (*Sir Robert Finlay.*) If I have rightly followed you, you think that, assuming the State does anything in this matter, it should have a Department for insurance conducted on strictly business principles?—That is so.

2017. Do you propose any special machinery for the settlement of claims?—No; I should not propose any special machinery for the settlement of claims.

2018. Then your proposal would be that it should be left to the ordinary courts of law?—Yes. If my premise that the business is to be done on business principles is granted, then that conveys necessarily a proper system of examination and settlement of claims. Just as in an ordinary marine insurance company a claim is examined and settled, so no doubt in the State Department it would be examined and settled. If there were a dispute as to the merits of the claim, then I take it, it would go to the ordinary tribunals. I think it should do so.

2019. The decision of any Board or Committee appointed for examining claims in the suggested Department would be no more binding than the decision of those who represent the underwriters or the insurance company, which can be always challenged before a court of law if the person insured desires?—I think that should be so.

2020. That is your view?—That is my view.

2021. There are two points on which I wish to have any information at your disposal. The first is with regard to the question of the transfer of British shipping to a foreign flag. I gather that you are not apprehensive of that taking place to any considerable extent in the event of a war in which this country is engaged?—I am not, because I think it would be recognised to be futile.

2022. Of course you are aware that reference has very constantly been made to the experience of the great American Civil War, and the alleged diminution of the shipping under the United States flag in consequence of that. Have you any observations to make to the Committee upon that?—No, except that I would suggest that in that case, it being a Civil War, strictly localised, a transfer to the British flag would probably be much more likely to be operative than it would at the present day. Of course, one always had to take into consideration the unwillingness of one of the belligerents to extend the area of the war.

2023. With a neutral?—With a neutral. But you, Sir, are probably much better qualified to deal with this than I am. I have no special knowledge on the subject. But my impression is that the North in that struggle would have made almost any sacrifice rather than bring England into the struggle.

2024. But the transfer which was alleged to have taken place in consequence of the war was rather of the shipping of the North passing under the British flag, or under other flags, and the American flag no longer covering it?—Just so. It would apply conversely to the South.

2025. Your suggestion is, in the first place, that it was never challenged, and, in the second place, if it was challenged, neither party would have cared to maintain the challenge?—Yes; and it does not afford a convenient precedent for a war between two belligerents of separate nationality.

2026. I gather that your view is that the premium on neutral ships and goods would, under present conditions, be almost as high as on belligerent ships and goods?—It depends very much on what happens. That is the whole crux of the situation. If there should happen to be a remarkable respect shown for neutrals, of course premiums would be less on neutrals. All I suggest is that in the late war there was no very great respect shown to neutrals.

2027. You do not suggest that that is of universal application?—My impression is that in the wars of the future these international arrangements will count for less and less. The thing will become too desperate altogether, and they will do whatever will inconvenience the other belligerent, so far as they could do so without inconvenience to themselves.

2028. Would there not be the element of possibly quarrelling with the neutral if they carried interference to a vexatious extent?—Obviously, and that is the only deterrent.

2029. Would you regard that as an important element in the case of this country being engaged in war with some great combination of naval Powers, not including the United States of America? You are aware that it has been suggested that in that case our food supply would be in no danger, because corn would be brought in United States vessels to this country. Would you regard that as an element likely to maintain the supply of food in this country, owing to the reluctance of our enemies to embroil themselves with the United States by declaring corn contraband of war, and seizing such vessels?—No; I am absolutely convinced that there is no protection for the food of this country except the British fleet.

2030. How would it work out in practice? Suppose the United States were sending vessels under the United States flag with corn here, do you apprehend that our enemies would declare corn contraband of war and confiscate those vessels?—I have no doubt they would.

2031. What would the effect of that be upon the United States?—I imagine the effect might be to drive them into alliance with us, but the belligerents would count the cost. If it paid them to do it they would do it. All I mean to suggest is that I do not believe that international arrangements would have the smallest weight. What would have the weight would be: Shall we extend the area of the war? and that is all. That is my humble opinion.

2032. But would not the danger of driving the United States into alliance with us be a very considerable factor in determining the action of the enemy in such a matter?—It might be, but it seems to me highly probable that if there were a combination of European Powers against Great Britain that combination would *ab initio* have to face a combination between Great Britain and the United States. I should think that would be a primary factor in the situation. But that is a question of State politics on which I am not competent to express an opinion.

2033. Your view is that in case of such a combination they would have counted the cost of going to war with the United States as well?—I think so.

2034. Just one other matter. I gathered in answer to the Chairman you said you thought it possible there might be panics, particularly in the early stages of a war, sending up the premium for insurance beyond what the risk fairly justified?—Yes. I think the premium for insurance would seldom be exactly in correspondence with the risk run. It would be sometimes more; it would be just as often less. But I think the tendency would be to underestimate the risks if the British fleet kept its end up. If it did not, then I do not believe things would be insurable at all; it would all go by the board at once.

2035. Apart from such a catastrophe as that, I suppose there might be panics on the insurance

markets, as on others, sending the rates up?—I do not believe myself in a panic on the insurance market without adequate ground, and therefore "panic" is not the word for it. "Justifiable apprehension" is a better phrase.

2036. Using the word "panic," I rather meant to indicate unjustifiable apprehension?—Just so.

2037. That is to say that the premium asked was out of all proportion to the risk, owing to men's nerves getting excited rather owing to a series of captures?—Experience is against that.

2038. I gather your view is that even if that did take place to some extent it would right itself?—Yes, I think so.

2039. (*Captain Ottley.*) Apropos of that remark you made with regard to the temptation to dishonest persons to put worthless goods on board a ship, in the event of there being a State indemnity, and then perhaps to declare the goods and the ship herself to be of great value, I feel that is, no doubt, one of the frauds that we should have to try and guard against. Do you think that if we made it an integral part of either Scheme A or B, or any other scheme which was eventually evolved, that no indemnity would be paid on any vessel which had not insured her ordinary marine risks, that perhaps that might tend to do away with frauds of that particular nature?—I think not at all, because the ordinary marine risk would be probably a mere bagatelle. You might have your fraudulent shipment in a first-rate ship, without the cognisance of the shipowner at all. Then the ordinary marine risk on that might be a quarter per cent., or might be 3s. 4d. per cent., a mere bagatelle that the man could face at once. War risk might be very serious; he would have to think twice before he embarked on that little fraud.

2040. And of course if there was no premium at all, any value that he declared, in the event of the capture of the ship, would be clear profit, less, of course, the very small value of the fraudulent goods, which I take to be negligible?—The notion of giving away this indemnity strikes me as being grotesque.

2041. Then there was one other very interesting remark you made which interested me very much from the naval points of view. You instanced the defects of the old war policies, more particularly in regard to the loopholes they allowed for large profits being made. I think you took the case of a ship, news of the capture of which was received in London, and you said thereupon the owners might rightly abandon to the underwriters at once and claim a total loss?—Yes, leaving the underwriters to the salvage.

2042. Yes. Of course you say in such a case as that, the declared value of the ship and cargo may be £40,000, when perhaps the actual net value was less, and then ten days afterwards you might hear that the ship was released?—Yes.

2043. The point I wanted to ask you about that was this. That, I think, would, no doubt, be a pertinent case if this country was a neutral. But if this country was a belligerent, and that was a British ship, we cannot contemplate that the ship would be released?—It might be recaptured. It is the same principle.

2044. I should have thought that there was a difference. That would be releasing the ship in the case where there was no valid capture, but in this other case it would be a valid capture?—Yes, but the injustice is just the same in the event of a prompt recapture. Why should the underwriter pay an enormous fine merely because the vessel has been temporarily in the possession of the enemy? It is not proper indemnity at all.

2045. Yes; I see your point. Then there were one or two points arising out of Sir Robert Finlay's questions I should like to ask you a question or two about. You think that the insurance of neutrals would not be very much less than the insurance upon belligerent ships for certain reasons which you have given us. Then do you think really in a war with this country our enemies would be likely to proclaim food stuffs to be contraband, and raw materials to be contraband, and manufactured goods to be contraband, to such an extent as to put the neutral absolutely on a par with the belligerent. Is that likely?—I should think it is more than likely. I should look upon it as a certainty.

2046. That is tantamount to saying that you believe that a country at war with ourselves would be prepared to directly proclaim an effective blockade of the entire British Isles. No neutral ship would have a right of coming in, because whatever goods she carried would be liable to capture, because they would be contraband of war?—The question is whether that constitutes an effective blockade.

2047. No; I am wrong in my words. It would, in effect, be a blockade of the British Isles, declared by our enemy, because nothing could get into the British Isles?—That would be its result if they were able to carry it out—yes.

2048. Then of course that would instantly bring our enemy up against the Declaration of Paris, which most civilised countries of the world have now signed, to the effect that a blockade in order to be binding must be effective. Now, is there any power in the world so strong at sea that she could effectively blockade the British Isles, that she could put her ships so closely round the whole periphery of these Isles that she could effectively blockade them?—I devoutly hope not, I am sure. I should think it is probably quite impossible. But excuse me, I do not quite follow this argument; that is to say, I do not at all follow that because a belligerent declares all food stuffs and raw materials to be contraband, he is therefore establishing a blockade in the technical sense.

2049. Not in the technical sense, but in the practical sense, because I ask you what ships is the belligerent going to let pass by?—I presume if he declared food to be contraband that merely gives him the opportunity of capturing any vessel containing food. That is a different thing, it seems to me, from establishing a blockade. However, that is merely a point again for which I cannot claim any authority at all.

2050. Of course it is fundamental to the question we are considering, because if it really is the fact that the neutral and the belligerent will be absolutely on a par in any future war, then there is no particular reason, from one point of view, why we should have a national indemnity at all, because one of our objects is to prevent our ships from being driven off the seas in war time by the tremendous competition of neutrals?—Exactly.

2051. (*Chairman.*) That is the witness' argument. What you are now stating is what the witness has been telling us.

2052. (*Captain Ottley.*) Yes. What I am anxious to try and ascertain is whether really, pressed home, that is the view, that we are to assume that our enemy will declare every kind of goods that are being brought into these islands to be contraband of war. Can you tell me what goods you think he would not declare to be contraband of war?—I do not know what measures he would take, but if he follows the example of the belligerents in the recent war, he will not scruple to sink neutral vessels that do not contain contraband at all, even on his own declaration.

2053. That, of course, I suppose you would agree, would result in bringing him into violent polemics, at all events, if not into actual hostility, with almost the whole of the rest of the world?—I believe it has only brought the belligerent in this case into very mild despatches.

2054. I think you have only got to carry it far enough. If a few more of these things had happened, do not you think that might have had the result of bringing us into war?—We stood a great deal, I may say, in the late war.

2055. (*Mr. Beauchamp.*) I think you will admit that if there were a considerable number of captures in the early stages of the war, the premium would go up?—Necessarily.

2056. Very considerably?—Necessarily, justly.

2057. And I think we generally understand that one of the reasons why the Admiralty are in favour of a scheme of indemnity is to allow them perfect freedom of action and not to be obliged in the early stages of the war to go directly towards the protection of commerce?—That may be a motive.

2058. I think we may take that as the Admiralty view, and it would naturally follow, I think, that there would be a considerable number of captures in the early stages of the war, and therefore the premia would rise, and if the premia were to rise to any considerable extent, do not you think that that would limit the insurance market?—I do not follow these premises. If the British Fleet neglect British commerce, and there are consequent captures, of course

Mr. C. Wright.

16 April 1907.

premiums must rise. But I should assume that the protection of commerce would be one of the primary objects of the existence of the fleet.

2059. I think I am right in saying that it will not be. I think the Admiralty want to be free not to go directly to protect commerce at the moment, but to go for the main fleets of the enemy, and then premiums would undoubtedly rise?—Of course whether the British fleet is capable of protecting commerce, or whether, as a matter of fact, it does it, it amounts to the same thing, does it not?

2060. Ultimately it will protect commerce, but immediately on the outbreak of war it will not attempt it. I assume that that is the view: it will not attempt to protect commerce directly?—But then the indirect methods that it may adopt may be the most effective protection possible.

2061. Ultimately?—But primarily even. If you destroy an enemy's base it may be primarily.

2062. That is getting rather into technical matters. But I think one of the objects of the Admiralty in advocating any scheme of this kind is to free them from directly protecting commerce at the earlier stages of the war. Now we had manœuvres this year, and a large number of the vessels were captured in the early stages; so that it may be difficult, under any circumstances, to protect commerce directly on the outbreak of war. About fifty per cent. of the vessels were captured under those circumstances. Assuming there was a very much smaller percentage, say even 5 per cent. or 10 per cent., that would send up the premium immediately, would it not?—Obviously.

2063. Out of all proportion really to the ultimate loss?—Not out of proportion to the current risk.

2064. If you had a certain number of vessels in one day posted as being captured, say three vessels, would not that send up premiums very considerably?—I think justifiably, but only for the nonce.

2065. When premiums had got up, what premium would act so as to close a large portion of the insurance market?—You see, so much depends upon the nature of the captures. If there were one or two Atlantic liners captured the effect on the insurance market would be tremendous. If there were one or two moderate-sized tramps captured the effect might be comparatively small.

2066. We will suppose three tramps captured between Gibralter and this country in one day. Do not you think that the premiums would rise very considerably?—I should say it would. I should say it would be very heavy on that voyage, but probably not so much on Atlantic voyages.

2067. What I want to get at is at what premium do you think the market would be very much restricted; what percentage of premium, 10, 15, or 20 per cent?—I do not think it is possible to fix it in that way.

2068. But if the average premium on war insurance amounted to 15 per cent. on a particular voyage, do you think that the market would be large?—Yes, I think it might. I think the increased premium might tend to enlarge the market, provided it appeared to be adequate. There was a good large market at the 30-guinea rate.

2069. How much do you think it would cover at 30 guineas?—We covered £50,000 on a bottom at 30 guineas.

2070. You are practically against really any scheme, but more particularly are you against the scheme A, the free indemnity?—Yes, I am very strongly against that.

2071. You have gone even so far as to describe it as grotesque?—Yes.

2072. Have you considered the alternative, and how much simpler the A scheme is than the B scheme? Have you contemplated what it would mean, supposing you had a scheme of payment for insurance, that you would have to set up a large staff and really an insurance department after the outbreak of war? Would it be possible to do that, do you think?—But I think you would have to have your staff for the A scheme, too.

2073. In the A scheme you only would have to deal with actual losses?—But there is the registration and record of the risks. Surely you could not have a man merely walking into the office and saying: "I want £50,000; my ship is captured."

2074. That is the idea, of course, of Scheme A. What objection do you see to that. He has to get his bare value fixed after the loss?—With regard to ships it is difficult to say precisely what the objection would be. But what is a bare value? What I mean is we know that many ships exist which, if they were run down in collision, it would be a source of the greatest joy to the owners, and at the value they would get from the Registrar of the Admiralty Court. Similarly there must be many ships that it would be a very pleasant thing to have captured at the value that this Committee would have to give them. There would be a congestion of these ships in the most dangerous places.

2075. You think that would be the case?—I think it is obvious, unless you are going to alter human nature altogether.

2076. You said you thought the man ought to know beforehand what he was going to get?—Yes; I am dealing with the other scheme entirely.

2077. Under Scheme A he would not know beforehand?—No, he would not.

2078. Therefore there would be no particular inducement to that man to lose his ship. He would not know what he was going to get?—Yes, he would; he would know within reason. A man knows pretty well what he will get from the Registrar of the Admiralty Court, and he would know what a Committee of this nature would give him. But with goods I do not know where we should be landed under a scheme of gratuitous indemnity.

2079. But do you think it would be possible to set up a Marine Insurance Department after the outbreak of war, where they had to fix a premium commensurate with the risk?—I think it would be extremely difficult, extremely impolitic, but very much better than the other scheme.

2080. Then you said that under this scheme something would be included; it would be more inclusive than it would be necessary to be?—Yes.

2081. You are only going to cover things which would be ordinarily covered by an English policy of insurance?—I thought not.

2082. Yes; if you look down page 2: "Losses to be covered by indemnity as ordinarily covered by an English policy"?—Yes.

2083. So that we should really only be covering what would be covered under what we call a war insurance policy?—Yes, excepting that I think this wording is somewhat ambiguous. It says: "Capture, seizure, and detention by the King's enemies, and the consequences thereof, or of any attempt thereat, and all consequences of hostilities or warlike operations by or on the part of the King's enemies, whether before or after the declaration of war, as ordinarily covered by an English policy." As you, of course, know the English policy is to cover the risk excepted by that clause.

2084. This does not bind us to this particular absolute wording, but our object was not to give the man anything more than he would have under a policy whereby he took the risks which were excepted by the clause?—Yes, that meets my point to a certain extent. Of course, as you know, I hold that the whole business of our war policy wants revision badly.

2085. That meets your point?—To a certain extent it does.

2086. (*Sir George Clarke.*) I think you have admitted that the rates of insurance would vary very much from time to time; there would be very great fluctuations?—Very great, I think.

2087. And that those fluctuations would depend not upon the total magnitude of the war losses, but on the way in which the losses occurred at different periods of the war?—Yes; they would vary according to the captures of the moment.

2088. If the captures came in a quick group at an early stage of the war it would produce a very high rate of insurance at once?—I think so.

2089. If a large Atlantic liner was captured at an early stage of the war it would produce a great rise in premium?—I think it would.

2090. Although it would not be a measure of the risks in the seas at that particular moment?—I think it would be a measure.

2091. It might be simply a chance, might it not,

whether a big ship or a small ship happened to be in that particular place at the particular time, so that it would not be a measure of future risks?—I beg your pardon, I think it would be a measure for the next few days, and the rate would vary from hour to hour and day to day.

2092. Then taking a view of the war as a whole, it is quite clear that insurance cannot be based on any accurate calculations at all. As you say, it varies from day to day. You also say it depends upon the circumstances as to how it varies?—Yes; from 5s. to 30 guineas in our recent experience.

2093. Gratuitous insurance, you say, would not ensure our supply of commodities, but cheap insurance, or insurance kept at a uniform level, would serve to prevent the check on supply arising out of a rise in the insurance rates?—No, I am not sure of that.

2094. Are not steady conditions for the shipowner and the cargo owner the conditions which are most likely to enable him to carry on his business?—Oh, he can carry on his business, but his profit or his loss depends, I think, upon the number of captures, not upon what he pays. It depends upon the scarcity or abundance at the port of destination.

2095. But if his insurance rates may be 5s. per cent. one day and 30 guineas per cent. the next, that must surely hamper him very much in his operations and his calculations?—Yes; that is to say, the captures would reflect themselves in the rates. The evil, I submit, is in the capture, not in the rate.

2096. But the keeping of the insurance rate level must be of assistance to him?—I think it would be an immense boon to the shipowner and the merchant, at the expense of the community.

2097. I think you say that if the State undertook war risks it would be necessary that it should be recouped. You put that as a *sine quâ non*?—That is my view.

2098. But you admit that no calculations of a rate that would actually recoup the State for the losses in a long war would be possible?—No. It must be fixed, I suppose, by men who are accustomed to estimate risks, and must be fixed to the best of their ability.

2099. Then in your paper you say that any attempt to lay down fixed rates in advance, to hold during the whole war, would be absurd?—Yes.

2100. Because the sole consideration must be that the rates must be commensurate with the risk?—Yes.

2101. But you still have explained that the rates can never be made really commensurate with the risk, because nobody can calculate them?—No, only as far as possible commensurate with the risk. What I have submitted is that if you fix a premium beforehand, then you will get all the bad risks and the underwriters will get all the good ones. Assume you fix a premium of 2 per cent., then every risk that the underwriter will take for 1 per cent. you do not get; every risk that he would charge 5 per cent. for you get at 40s.

2102. That, of course, is perfectly true, but you would admit that it might be advisable in the general interests of commerce that that advantage should be given to the trading community?—I think not, because I think it would be so grossly unjust to the rest of the community.

2103. Then your objection really is that the rest of the community would have to pay too much for it?—They would have to pay not only the indemnity, but they would have to pay the enhanced price resulting upon scarcity following on the captures as well.

2104. But there is nothing in the nature of things that makes a fixed rate unscientific. If you had anything like data, of course, you could make it absolutely scientific by spreading the risks over the war. If you assume that the British commerce at sea will be so much, and that the total losses of the war in cargoes or ships will be so much per cent., you can get a rough estimate of what the losses will be over the whole war. If you fix your fixed rates on that, and if you knew that, it would be quite scientific?—I do not think so.

2105. That is exactly what you cannot say?—No, With due respect, I disagree, because if you get an average rate fixed over the war, embracing all sorts of different periods of risk, then you may be unduly favouring the man who passes his shipment through at a period of maximum risk, and unduly fining the man who passes his shipment through at a period of minimum risk, because you have only got the average.

2106. That is perfectly true, but regarding the State as an underwriter for the time, it would be all right as far as the State was concerned?—Even there I do not think it would be quite right, because you have to consider the effect on prices in the interim. If you could imagine the State as one great entity—that is, supposing that it were entirely a Socialistic community—then I think the argument would be correct. But as it is not, I think you would be favouring individuals at various stages.

2107. Then your objection to a fixed rate is not so much that it is unscientific, but that it would lead to unequal incidence on individuals; the State would favour one individual at the expense of others?—I should say it is unscientific because it is inappropriate to the conditions.

2108. But still it would be scientific if it had the effect of steadying insurance throughout the period of war and helping to keep things going?—I do not agree with that use of the term "scientific," but it might be useful in that way.

2109. In the Japanese case that you have referred to, at what period did the underwriters get the idea into their heads that the Russian Navy was no good?—I think they started with that idea that the Russians were no use at sea.

2110. In that particular case the area over which captures were made was limited really; whereas if we were at war, with our commerce spread all over the seas, captures would be liable to take place anywhere. The cases are not the same?—Not by any means; therefore it gives underwriters a better chance. In the case of Vladivostock everything was converging to Vladivostock, and at one period the Japanese got every ship there was. But with our immense coast line underwriters would have a much better chance. Ships could run from one port to another, and it would be impossible to watch all the ports.

2111. (*Chairman.*) I want to ask you one more question in reference to what you have said about the losses to be covered by indemnity. Is there any form of war policy now in use other than by reference to the excepted risks in ordinary marine policies?—I think some of the war clubs have a different code.

2112. But not in use outside mutual clubs?—No, I do not know of any one in use outside mutual clubs.

2113. Could you form any idea in your own mind of what the insurance rates on a cargo of corn coming across the Atlantic would be likely to be in the early weeks of war if we were engaged with a combination of European Powers?—It is very difficult to forecast that in any way. The question of convoy would arise. You see if we had got a combination of European Powers against us it might really become necessary to convoy fleets of merchant steamers across the Atlantic. All those questions arise. I think it is impossible to estimate the risk without regard to the exact circumstances of the moment.

2114. I will not press you for a figure if you do not feel inclined to give one. Some of the witnesses have ventured to give us a figure. You would prefer not?—They are gifted with better imagination than I am.

ELEVENTH DAY.

Tuesday, 23rd April 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE H. MURRAY, K.C.B.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. ARTHUR LINDLEY.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. DOUGLAS OWEN, called and examined.

Mr. D. Owen.

23 April 1907.

Mr. Douglas Owen, in a preliminary memorandum,* had submitted:—

(1) That the objects of a scheme of national guarantee are:—

(*a*) the cheapening of food supplies and raw materials during war;

(*b*) the protection of the national shipping interests;

(*c*) the protection of the manufacturing and export trades;

(*d*) the provision of cargoes for our shipping in United Kingdom loading ports.

(2) That there is reason to believe that one of the effects of the Declaration of Paris will be to drive trade into neutral vessels, and that high rates of insurance on food stuffs and raw materials will affect us disastrously.

(3) That in the interests of British trade a law should be passed reviving the Navigation Laws, imposing a cargo tax on goods imported in neutral vessels, and prohibiting sales of shipping to neutrals, to become operative in time of war only.

(4) That a scheme of State guarantee initiated in peace, and open to all ships on payment of a registration fee, and its acceptance by the State, is desirable. (Mr. Owen's scheme is printed in full in the Appendix.)

(5) That Scheme A, with some alterations and additions, is preferable to Scheme B, which would be unworkable.

2115. (*Sir George Murray.*) You have been kind enough to prepare a very complete scheme for the Committee, for which I am sure they are very much indebted to you. You gave evidence, I think, before the Food Supply Commission?—Yes.

2116. You have been engaged in insurance business for a good many years?—Yes.

2117. The Committee have before them your scheme, so that I think it will be hardly necessary to go through it verbatim, or clause by clause, but there are a few questions I should like to ask you?—If you please.

2118. In the first place, to take what I may call your premises, I gather that your view is that the provisions of the Declaration of Paris, though they are likely to facilitate and even insure the arrival of our supplies, will in all probability prove fatal to our shipping industry and our carrying trade?—Yes, I feel that strongly.

2119. As you put it in one part of your memorandum, we are in fact in the grave dilemma that exactly in proportion as the Declaration of Paris gives us free supplies, so conversely, does it drive trade from British to neutral bottoms. If we had to choose between the two, I suppose you would prefer that we should get our supplies, and leave our shipping industry to take its chance?—I should not like at all to have to make the choice, but I have been connected with shipping for a great many years in an academic way, and I am very alive to the great danger to our British shipping. I regard the shipping industry, as probably we all do, as really the greatest industry of the country, and I could not willingly see the greatest industry of the country left to take its chance.

2120. But you would rather have supplies in neutral bottoms than no supplies at all?—Unquestionably.

2121. Then I imagine you would not agree with the view which has been put before us by very competent witnesses here, that, judging by the experience of the Russo-Japanese War, the advantage of neutral shipping in time of war is more or less illusory now; that so little respect is paid by belligerents to neutral rights that the rates on insurance, and I presume freights and so forth, are not very much in favour of the neutral shipowner?—That is rather a difficult question to focus all at once, but so far as I can understand it I should not agree with it. I should not be prepared to admit as a broad principle that the rights of neutrals are neglected by belligerents. I do not think so. There may have been instances in the late war in which we may have seen rather glaring instances, as we thought, of one belligerent country disregarding the rights of neutrals, but I do not think as a broad proposition the proposition is true. I do not think it is a proposition to be counted on in the future.

2122. As a matter of fact you would not agree that even in the late war the rates had been so nearly alike as I have suggested?—I cannot focus the thing. I really do not know. I should not like to say off-hand.

2123. I think one witness went so far as to suggest that a Japanese vessel would not have been charged a much higher premium than an English vessel, contraband of war apart, of course?—A Japanese vessel where from?

2124. From Rangoon to Yokohama?—From Rangoon to Yokohama with rice.

2125. (*Sir James Mackay.*) Would you say that a Japanese ship would have to pay a higher rate of premium than an English ship?—Of course, I am not an underwriter, but I should think that the Japanese would have to pay a higher rate. Rice, no doubt, is the staple commodity of the Japanese Army as well as the Japanese people, and it is very much an open question whether Russia would not be entitled to seize rice going to Japan, on the ground that it was going to the Japanese Army. Of course, in English law the cargo would not be confiscated, but paid for. But the Russians would not take that view.

2126. (*Sir George Murray.*) However, speaking generally, you still think that the neutral shipowner in time of war would have a very considerable advantage?—Unquestionably.

2127. And so much so as to practically drive belligerent shipping off the sea?—Certainly. In any case,

Vide note, p. iii.

especially where there can be no question as to the belligerent nature of the cargo; that is to say, if the cargo was Manchester stuff, and such things as that I think there could not be any question. The case of rice which was put just now is one of the very delicate and difficult questions one has to consider.

2128. Of course, that is a question of contraband?—Very near it.

2129. Then your proposal is practically to neutralise by special measures the advantage which the Declaration of Paris will give to neutral shipowners?—Over British ships, yes.

2130. And you propose to do that by three measures? The first is to close the trade within the ports of the Empire to neutral shipping?—Re-introduce our Navigation Laws, in fact.

2131. Have you thought how far that would conflict with our present Treaty obligations?—That I do not know. I have especially made a note about it. That is what I do not know. I know our Navigation Laws as regards our coastal trade were only abolished in 1854, and I know the Americans have got them still right round the coast from New York to San Francisco. I know the French have got them, and other countries have got them.

2132. I think you may take it that in nearly all our Treaties of Commerce and Navigation we have guaranteed what is called national treatment to the contracting parties, and if we have, it seems to me that that would be an insuperable difficulty to closing the trade, would it not?—It looks a very serious objection if that is so. If the Treaty is merely that of a favoured nation clause, under which nobody shall be treated better or worse than another, that is a different thing altogether. But if we have undertaken to put them on the same footing as our own ships, I fear that as the Treaty is now drawn that would be a serious bar.

2133. I think that is so. I think a Treaty of Navigation nearly always guarantees national treatment, and not the most favoured nation treatment?—If so, that is very serious.

2134. Would not a Treaty of that kind be an objection to your second proposal too—namely, a cargo tax on British goods exported in neutral vessels?—I should think it is the same question.

2135. Then your third proposal is to prohibit the sale of British shipping to neutrals in time of war?—Yes.

2136. You think there is machinery to carry that out?—No doubt about that. That could be done easily.

2137. Do you know what the steps are that have to be taken to transfer a British ship?—I know there is very considerable formality to be gone through—transfer on the British Register, and so on. It is a very serious business; no transfer can be made except by complying with very strict and pretty clearly defined regulations.

2138. It occurred to me on reading those proposals that the object of them being, as I say, to neutralise the provisions of the Declaration of Paris, it would be a shorter way to withdraw altogether from the obligations of that instrument. Of course, one of the principal features of the Declaration of Paris is that the neutral flag covers enemy's goods. You are proposing to take very great care that the neutral flag should have no English goods to cover. Would it not be better to make short work of the Declaration of Paris and get out of it altogether?—Without having just recently considered that question, I should think that would be the best solution of the whole thing, if we could do it.

2139. Do not you see something rather illogical in adhering to the Declaration of Paris and then passing three measures such as you propose?—No, I do not see anything illogical in that at all. I think the passing of the Declaration of Paris in the way it was adopted was a gross blunder. But having now discovered that the blunder is there, I think we are quite within our rights in doing what we can to protect ourselves as the great maritime Power against the consequences of the blunder. I do not think it would be illogical.

2140. I gather that you do not think that a scheme of indemnity such as you propose, if carried out completely, would be sufficient without these other three measures?—I do not think it would protect our shipowners at all. It would simply save their pockets as regards war premiums.

2141. Would not that be a sufficient protection?—No, because merchants would still pick out neutral ships. Supposing you had got a neutral ship and an English ship loading at Liverpool, a merchant would say: If I send my goods in the neutral ship there is no bother about it; she cannot be captured. If I put them on board the English ship they may be, and I have got to pay insurance premium.

2142-4. But the hypothesis is, is it not, that the premiums would be the same?—Yes, but the avoidance of insurance premium is not everything. The British ship will always remain exposed to the delays incidental to hostilities and to Admiralty orders, while the neutral ship will sail without interruption to her destination; and, after all, what a shipper wants is to get his goods to their purchaser. This is what the purchaser wants, and the shipper will do his best to fulfil the wishes of the purchaser. If the British ship be captured, say on the way from England, the State will pay the value, actual value, of the goods captured, but not, as I take it, the profit which the consignee expects to make on them. Therefore, the consignee will give instructions to ship by neutral vessels. No doubt the fact that there will be no war-premium to pay will go a great way to put the British on a level with the neutral ship, but by employing a neutral ship, risks of delay and detention and, in the case of outward-bound ships, of loss of destination-profit, will be avoided. Therefore, I believe that neutral ships (which, moreover, will probably be able to carry cheaper crews, and therefore to charge lower freights) will always get the preference.

2145. Then to come to the scheme itself, I see you think it ought to be started and in working order in time of peace?—If it is to be any good at all.

2146. And you think that it should be tested in its working. I did not quite understand how you proposed to do that?—Here is a big new scheme untried. War breaks out suddenly, and everybody at sixes and sevens; no one knows anything about it. It is in the same way as we test our Navy every year in manœuvres of some kind or another; every scheme ought to be tested to see how it works, more especially a quite untried scheme of this kind.

2147. But how would you propose to test a scheme which depends on the existence of a belligerent?—You can only test it up to a certain point—that is to say, you can ask the shipowners to fill in their forms saying where their ships are, this information to be immediately posted to Lloyd's, and everything would be done in the same way as it would be in the case of war. Up to that point everything, in peace or war, would be on the same footing. I grant you cannot hold up ships all over the world in time of peace; but the essential or preliminary part can be tested.

2148. Then I pass to the establishment of the Fund. In Section 2 you speak of the co-operation of the Admiralty. You say the Lords of the Admiralty shall proceed without delay to formulate instructions for the guidance of the owners of enrolled vessels on the outbreak of war. Those, of course, would be very general directions, because the specific directions and the important directions would depend on the circumstances of the time?—No doubt.

2149. What kind of directions had you in your mind?—Would you be so kind as to read that again?

2150. "On the passing of the Act"—that is at once on your assumption—"the Lords of the Admiralty shall, in consultation with the Trustees and the Committee of Lloyd's, proceed without delay to formulate instructions for the guidance of the owners of enrolled vessels on the outbreak of war, including a system by which the owners, on public notification in that sense, shall immediately inform the Admiralty as to the position and voyage of their vessels enrolled"?—Those would be instructions *ad hoc*; general instructions that the shipowner must not send his vessel on until he has got the special instructions. He must hold her up wherever she is. If the ship happens to be lying at Cape Town, for instance, his captain is to understand that he is not to sail to-morrow as he would otherwise sail, but he is to wait instructions.

2151. Do you contemplate that it would be possible when war breaks out to give individual instructions to each ship in every part of the world?—Of course the moment war breaks out, as I take it, it will be flashed all over the world. Everybody will know it at once.

Mr. D. Owen.

23 April 1907.

Every shipmaster will know what his position is then, that he has got to wait for his instructions. It is incidental to my scheme that every shipmaster will be fully impressed with the fact that if war breaks out he has got to "stand by" till he gets his orders. Then the only question is how soon and by what means those instructions can be got out. It seems to me if there is a British Consul on the spot the instructions can be cabled out to him, or the shipowner here would learn from the Admiralty what the instructions were as regards that particular ship, and he would cable them out. Of course, one must assume the existence of the cable.

2152. And the instructions so given, I presume, would say that some particular route is more dangerous or less dangerous than another, or some particular route would be absolutely prohibited?—That would have to depend on the voyage. The instructions might be, "Proceed at once," or "Proceed in the ordinary course." They might be. "Wait further instructions." They might be, "Proceed to such and such a place for rendezvous; or for further orders." It would depend absolutely on the voyage and the war conditions.

2153. And those instructions you contemplate would be issued by the Admiralty all over the world, not to shipowners in this country for communication to their captains?—My idea is that I, being a shipowner, fill in one of the Government forms and send it in to the Admiralty or Lloyd's. I have got ships in three different parts of the world, I will say, at ports or due at ports. I ask for the instructions of the Admiralty having regard to the voyages of those ships, and they would say, perhaps, "As regards one and two there is no reason why you should not proceed, but as regards No. 3 that must be held up for the moment at any rate" and the owner would cable that out as he cables out his other instructions.

2154. Do you think that a scheme as detailed as that could work in time of war, involving as it does, consideration by the Admiralty of the voyage of every ship on the ocean at the moment?—Yes, I think it would. No doubt there would be a good deal involved, but if you are to have any scheme you must have some basis of that kind. As regards many of the voyages the Admiralty would regard them as practically out of the danger zone, and could instruct *en bloc* accordingly. I do not see why it should not work.

2155. You think merely general instructions would not be enough?—No, I do not think they would be any good. You must discriminate between safe voyages, dangerous voyages and doubtful voyages.

2156. Then we come to the establishment of the Board of Claims. It has been suggested to us that a new clause for the covering of war risks would be desirable. I gather from your statement that you are satisfied with the existing Lloyd's policy and the various legal interpretations which have been put upon it, which enable shipowners and underwriters to understand exactly what the state of the law is?—Yes.

2157. You would not attempt to meddle with that?—I should not, because there is no branch of marine insurance in which the law is more clearly defined, owing to a long course of legal decisions, than that of the law of capture. We all know it, or can find it by turning to our text books. Of course, there will be always some unsolved questions, but there is no branch of marine insurance in which the practice is better settled. I think the moment you begin to introduce alterations you produce confusion, even if the alterations are in themselves desirable.

2158. Then do you attach importance to this point in Sub-section 3 of Section 3: "The Board to have power to sue and be sued as if it were a public marine insurance company which had insured war risks only, under a Lloyd's policy"; and lower down you say, "Claimants to have right of appeal direct to the Court of Appeal in the case of any rejection of a claim on the grounds of alien ownership of the property or otherwise." Do you not think there would be a great advantage in making the decisions of this Board of Claims absolutely final without any appeal whatever?—You see, one of the great objections to any scheme at all is that it will be in the hands of Government officials, and Government officials do not, and in the nature of the circumstances cannot, understand the requirements of business men. The business man, the merchant or the shipowner, if he sustains a loss goes at once to his insurance company, and if the thing is in order—and in nine cases out of ten it is—the thing is settled and he gets the cash almost so to say on the nail. My idea was that to overcome that objection there should be a body established as nearly as possible practically identical with a marine insurance company or with Lloyd's. If a shipowner goes to his Lloyd's underwriters and asks for payment, and the Lloyd's underwriters say "We do not consider that you are covered by the policy," he brings an action in the first Court, and if judgment is given against him, and he is dissatisfied, he goes on to the second Court, and sometimes in the House of Lords he will still get judgment on appeal. I think if you are going to say that this body, whatever it may be, is to say yes or no and that this shall be final, that will not suit the merchants. They will say, "We have less confidence in this body than in an insurance company that we know, or in Lloyd's underwriters whom we know and who know us; and as in dealing with our own people we have the right of appeal and they have the right of appeal, why should this new body be on a new-fangled system?"

2159. I quite appreciate your distrust of the methods of public departments?—I do not wish to disparage them, but I see the difficulties of this particular case.

2160. I thought you provided against that in your own scheme, because you say, to begin with, "The Board to consist of nine underwriting experts, being Claims Examiners of Marine Insurance Companies"?—That is true, but I think there are three Government officials in it, and perhaps shipowners and merchants, like the rest of us, are influenced by usage. They have been in the habit of insuring all their lives with a certain company or with certain underwriters at Lloyd's, and they will say, "Oh, no, we know those people. If you are going to turn us on to strangers we do not know where we are; besides which our own friends to whom we have been in the habit of giving our business have got their individual reputation for liberality to maintain, and these people collectively have not."

2161. They would be more likely to be liberal in dealing with other people's money?—No; underwriters pay a lot of money for which they are not liable, simply for the reason of their reputation for liberality to clients. If underwriters dealt with claims only on their strict legal merits, the assured, in difficult cases, would come much worse off.

2162. Then you think they would be less liberal in dealing with other people's money?—Yes, because their individual reputation would not be at stake.

2163. Will you look at page 7 of the paper, No. 18. There, in order to arrive at the value of the ship, you have a special committee called the Ship Valuation Committee, which has on it three representatives of shipping, three representatives of the Association of Average Adjusters, three representatives of underwriters, and, I observe, only one Government representative, so that even on that Board there would be a very large representation of what I may call the commercial element as compared with the official element?—Yes, clearly. Really it is not an official question at all. Establishing the value of a ship is a mercantile question.

2164. Might not you say the same of the questions that will be submitted to the Board of Claims?—I should not object to saying so, and excluding the official element, at all. I rather think I put that in out of deference to what would probably be the official view; they would not like to be out of it. But to exclude them would suit me still better.

2165. Then if the Board of Claims was constituted in what you would consider an ideal way—that is, excluding as far as possible the official element—do not you think that the commercial community would be satisfied with their decisions, without any further appeal?—Yes, I am inclined to think so, though it is not certain. But decidedly they would want to be sure that the official element was not represented.

2166. Even in your scheme you have let the official in to a very small extent?—That is quite true. You see shipowners and merchants are very suspicious indeed of official methods, and they would want to feel sure that in dealing and being dealt with they were being dealt with by people who understood exactly what the needs were, and what was usual and what was required.

2167. I thought your scheme had provided for that very well, and quite sufficiently, because after all the great majority of the questions which the Board of Claims would have to decide would be questions of amount or value, rather than questions of law or of

fact?—Undoubtedly; but sometimes there is a question of principle involved which may strike the outsider as a small principle, but it is quite enough to hang a very large sum on it.

2168. Then you propose that a Register should be published annually of all the vessels enrolled under the scheme, and that there should be a fee charged for registering?—Yes.

2169. A fee varying according to tonnage?—Of course, as regards the amount of the fee I had to put in something to make my meaning clear, and that the Committee should have something to consider. What the amount should be I am not prepared to say. My figure may be reasonable or it may not. My idea was to put in such a fee that, while it would produce a substantial income, at the same time would not be such as to deter the shipowners in any way. They would see that they were still getting a great advantage. The object would be to make the fee as high as you could without divorcing the sympathies of the shipowners.

2170. Do you mean that the fees should cover anything more than what you may call the administrative expenses of the scheme?—Yes. Why should the shipowner get all this for nothing? At present they are paying a large sum for it. We are not here to make them a present. Then if they are not to get it for nothing, if it is worth their while to pay something for it, how much shall they pay? If they can pay enough to produce a substantial sum towards the expenses of the scheme, whilst still gaining substantially by it, all the better. I have not any figures in my mind at all, but supposing it to cost shipowners £300,000 a year to insure against war risks—it may be £3,000,000 for all I know—and my figures here say that they shall pay to this scheme £100,000 a year, it is quite obviously immensely to their advantage to save £200,000 a year. But if we can get from them £150,000 or £200,000, quite obviously, from the point of view of the State, it is immensely to the advantage of the State that we should have a fund rolling itself up year by year to meet the time when it will be called upon. I forgot what I call the suggested figure, £50,000, I think. Taking the shipowners by themselves, and calling it £50,000 a year, in ten years there is more than half a million, and supposing fifteen or twenty years pass, we have a million in hand to start with. I do not think the nation is called upon to do this absolutely for nothing for the shipowner. I do not think the shipowner would expect it or want it.

2171. What struck me was that your figure was either too high, or too low. It would be very difficult to look forward to 50 years peace, or any other number of years, and you would always be in the difficulty that the shipowners would say, "You are rolling up too much," or if the war did come you would find you would not have enough?—Supposing the shipowner were to say, "You are rolling up too much," the answer would be, "It does not matter to you; it is costing you less than insurance would have cost you; we shall have war one of these days." Shipowners will not mind as long as it is not costing them anything.

2172. You think that, at any rate, a tax of 7d. per cent. on the value of the tonnage would not be excessive?—No. I think they would pay three or four times as much as that to insure.

2173. Yes, you put 2s. per cent. per annum as about the charge for insuring war risks in time of peace?—Yes, on a twelve months' policy. As I say, I am not an underwriter, but that, I imagine, is pretty near the mark.

2174. Then we come to the cargo owner's contribution to the cost of the scheme. That is Section 8 of your memorandum. Your suggestion there is that the receipts from the stamp duty on marine insurance should be ear-marked as a contribution from cargo owners?—Yes, that is the effect of it. I do not know whether, as a matter of fact, it is possible to ear-mark contributions in that way but I suppose it would work out in this way, that the Inland Revenue would transfer the equivalent to the fund.

2175. But would that be a contribution from cargo owners?—Certainly, purely. I mean policies on cargoes, not on ships.

2176. Not from shipowners?—No, absolutely from the cargo owner. You see, the cargo owners, as it is, pay (subject to certain exceptions) a duty of 3d. per cent. on every policy they enter into. They have paid that, or a larger sum, from the very beginning, from the time of George III., or whenever it was. Of course, logically, as I say, there is absolutely no defence for the tax at all, but if the cargo owner were to be called on to contribute to the scheme, then there is at once a logical justification for the tax, or whatever you would like to call it, and, assuming that things remain as they are now, the stamp duty that they now pay for fiscal purposes would be a stamp duty for the purpose of paying the insurance premium—to the support of the State Indemnity Fund.

2177. But my point is that the present marine insurance duty covers insurances on hull, and, I suppose, freight, as well as cargo?—It covers everything. You see, the shipowner has to take out his own policy on the ship. That is one stamp duty. He has to take out his own policy on freight; that is another stamp duty. The cargo owner has to take similarly a policy on his cargo; that is a third thing. They are not bound up together, each stands on its own merits.

2178. Then, as I say, the present receipts from marine insurance duty do include contributions by shipowners as well as cargo owners?—Yes. What are they?

2179. (*Mr. Lindley.*) On the basis of your figures they work out at 4¼ millions. Assuming 17,000,000 tons at 6d. per cent. on a valuation of £10 a ton, it comes out at 4¼ millions?—£4,250,000. Does not Mr. Lindley mean £42,500? It is per cent.

2180. (*Mr. Beauchamp.*) The whole stamp duty is about £220,000?—Yes, I think it is something of that kind. But I do not think I am suggesting here any stamp duty to be collected from shipowners. I think I am simply dealing with the cargo.

2181. (*Sir George Murray.*) Then you would have to alter the incidence of the existing marine insurance duty, so as to include so much of it as is now levied on policies insuring hulls and freight?—My view is that the insurance duty is all wrong, and ought not to be charged at all, but inasmuch as there is no reason why cargo owners, who are going to benefit vastly by a scheme of this kind, should benefit without paying anything for it, I should like the tax to remain, in respect of indemnified cargoes, the amount collected to come through the Inland Revenue to this scheme.

2182. Then we come next to the vessels and their freights capable of enrolment. The vessels capable of enrolment would be any vessels owned in the United Kingdom and so registered. Then you go on to discuss whether indemnity should only be given on vessels coming to this country or vessels sailing from it?—Yes.

2183. It would be just as necessary, would it not, to protect our export-carrying trade as our import trade?—I think so.

2184. The two stand practically on the same footing?—I think so.

2185. Then the voyages on which cargo is covered appear to be all voyages to British and neutral ports, and all voyages from British and neutral ports?—All voyages from the United Kingdom to colonial and neutral ports, yes.

2186-92. Then you have excluded certain goods from the scheme. I could not quite follow on what principle you had gone for that exclusion. Why do you exclude watches, for instance?—My idea was that a scheme of this kind should protect the nation's supply of food and raw materials. That is all we want to do. It is very difficult to draw a line. Somebody said at the Food Commission that pianos should be excluded, and I said you cannot begin to tinker and draw a line here and draw a line there. But I think you can draw a line in this way, that such things as pictures and watches, and so on, are not raw materials and not necessaries, and more than that, sometimes particular questions of values are mixed up with them.

2193. You have included various other things besides food and raw materials?—Yes, because of the difficulty of drawing a line.

2194. Do you not think it would be simpler not to exclude anything?—No. I think these things stand on a different footing.

2195. It would be a very long list, would it not?—No, I think this list covers very nearly all.

2196. But your idea is to exclude everything that is not either raw material or food?—No, I would not say that. The idea that one had in one's mind was that all that was necessary for the purposes of the guarantee was raw material and food. But as soon as you begin to draw the line it is so difficult, if not impossible, to say

Mr. D. Owen.

2 April 1907.

what is raw material or a necessary, that I thought it better to let everything in, simply excluding by name these things that are quite obviously not necessaries at all. As regards gold and silver, it would not be desirable that a merchant should go and put a lot of gold and silver on a ship at the nation's risk. Special provisions ought to be made for that.

2197. It might be rather important for the nation under certain circumstances?—Then let them put it on a warship, as they used to do in the old days, and make special provisions. We do not want to have a million pounds worth of gold coming home from the Cape, or wherever it may be, simply on the broad understanding that the Government runs the risk. It should be on a warship, or special provision should be made.

2198. I do not quite see why you except gold and silver?—Because of their very great value in a small compass, for one thing. That is the first thing. Secondly, they are certainly not what we understand by raw materials. I think you must draw a line somewhere, and I have drawn it as low down as I can. I had in my mind, for instance, somebody sending home a work of art, which, he says, is worth £500,000, and we think it may be worth £5, or anything of that kind. It produces all sorts of difficulties. You are dealing with things that there is no market value for, to some extent, and all kinds of difficulties will be created unless you knock out things of that sort. We know the value even of pianos, for instance; but when you come to works of art, it is a different thing. As regards shipments of gold, which in a way no doubt is both a very important raw material and a necessary, they can, of course, be included in the scheme, but to protect the scheme the inclusion should involve compliance with special provisions as regards shipment and carriage.

2199. Then, as regards the risks to be covered under the scheme, you put in first the ordinary risks of capture, seizure, and detention, and then, you think, you would add a clause protecting against losses by seizure or damage to ships or cargoes, by, or on behalf of the King or the King's allies. Is there such a clause in the policy now?—No, because the policy covers losses generally. It would include that.

2200. It would include that?—Yes. It is a capture or seizure or sinking, whatever you like to call it. The ordinary policy is against capture or seizure or sinking.

2201. That would cover capture or seizure by the Government?—By the Government, yes.

2202. Then why do you think it is necessary to add that?—Because if you are simply going to put the first clause in, the ordinary underwriters would be liable for sinking a ship to block the mouth of the Thames; whereas the Government would be liable if the same ship was captured by the enemy. As soon as you are going to differentiate between the two things, then you will have to juggle with the wording of the policy. But any losses resulting from war should be taken out of the marine policy altogether. Of course, these things will not happen often, but it is better for them to go in as part of the Government's risk. Supposing the Government sinks a ship at the mouth of the Thames in time of war, or does anything else of that kind, the merchant would under existing methods go to the underwriter, the underwriter would pay him at once, and would then in the name of the assured go to the Sovereign.

2203. But if a loss sustained in that way is already covered by the free-of-capture clause, why do you want to add anything to it?—I am afraid I have not made it clear.

2204. (*Mr. Beauchamp.*) It is not covered by the free-of-capture clause. It is in the policy as a whole. But it is not covered by that particular clause, if you separate the two?—That is so; the proposed clause, merely against hostile capture, would not cover it.

2205. (*Sir George Murray.*) What words does it come under now?—"All arrests, restraints, and detainments of all Kings, Princes, and Powers whatsoever, losses, and detentions at sea, and maritime risks"—a long string of words.

2206. Then it is not in the war-risk clause, but it is in another part of the policy?—It is covered in the policy exactly the same as an ordinary capture is covered. It is a loss. The marine policy is practically against all losses arising at sea. A marine policy covers an intentional sinking by the Government for war purposes, just as it covers a simple capture. I say if you are going to take out a simple capture and put it on the State, take out an intentional sinking too.

2207. I think I follow. Then you raise a question of what should be done in the case of a doubt whether a loss should be attributed to war or to perils of the sea. I suppose you would say that the indemnity would only cover a loss positively proved to be due to capture, or the action of the enemy?—No, I would not say that. The merchant or shipowner wants to feel he is not going to fall between two stools. If his underwriter says, "This loss was due not to perils of the sea, but to a torpedo, or something left lying about as the result of hostilities, and you must go against the Government for it," and if the people administering the Government indemnity scheme say, "Oh, no, there is no proof that it was done by a torpedo at all, the ship presumably ran on some wreckage, we are not going to pay." Then the merchant may be in the position of not being able to recover from anybody. An English underwriter would not take up that position unless he had good reason for it, but if he took up that position, the Government would under my scheme say, "All right, we will pay, and we will go against the underwriter." Then the merchant or the shipowner would feel that he was in any event protected, and that there was no risk of falling between two stools.

2208. Then it would enlarge the scope of this scheme very much?—No; these things are very rare. There might not be one in a whole war, or there might be a dozen at the very outside.

2209. It fits in with one feature of your scheme, which is to constitute the indemnity board as if it were a marine insurance company?—Yes. If a man is insured by an ordinary marine insurance policy including war risks, and his ship is lost at sea, he goes to the underwriter and says, "My ship is lost." It does not matter whether the ship has run against wreckage, or been wrecked by a torpedo, the underwriter says, "I am liable to you." But if the underwriter, under the scheme, is to be put into a position to differentiate between causes of loss, then, unless the merchant or shipowner is sure of recovering, he will be liable to fall between two stools, a thing which he has a holy horror of.

2210. He might do that now, if there were two policies?—Yes, he might. Such a thing might quite possibly happen.

2211. Do you think it is common to separate the war risk from the other?—It is common—that is, frequent—but it is only a comparatively small portion of the whole.

2212. What does the insurer do now under such circumstances? Does he proceed against both?—Such things, as I say, are not common. He might sue them jointly, or he might arrange that the underwriter who had got the worst case should pay him, and that the underwriter, having paid, should go against the other one. Or the two underwriters might agree to share the loss. It would work out in that way, somehow.

2213. Do not you see a very great advantage, so far as administration is concerned, in leaving the onus of proof of a loss due to war on the person who claims?—Yes, it always is on him, but then you get occasionally a difficult case, where the element of uncertainty comes in. Proof can only go to a certain point, and if the insurer says, "All the evidence points my way," the underwriter may say, "Well, all the evidence that you have got, but we are inclined to think so and so."

2214. Of course, it would be highly desirable to exclude as many elements of litigation as possible?—I do not think this would make for litigation at all. Really, it is putting the insured just in the same position as he is now where he insures his ship, not including war risks, with a company, and the war risks with Lloyd's. He is quite familiar with the position. There is nothing novel about it.

2215. In Section 13 you say that at the outbreak of hostilities, or in anticipation of hostilities, the ostensible owners in the United Kingdom of cargo destined for a port in the United Kingdom for orders, must make their option immediately. What exactly do you

mean by immediately? Before they start on the voyage?—No, they are on the voyage already. We will say bills of lading have been sent to me here from a shipper in some part of the world with a cargo of wheat. I am the owner of that cargo, inasmuch as I hold the bills of lading. The ship is ordered to come to Falmouth for orders. I study the position of the market day by day, and when the ship is telegraphed as having arrived at Falmouth, I have to decide whether it would be most to my interest, as cargo owner, to send the ship across to Antwerp or Hamburg, or let her come to Liverpool or London. But when war occurs, I have to make that option immediately, although the ship has not arrived. I have to guarantee to the Government that when the ship arrives she shall go to a certain port. There must be no juggling about it. We do not want to be in the position of paying for a cargo that, after all, would have gone to a Continental port. The man must make his option at once.

2216. Suppose the owner of the bill of lading was outside the United Kingdom?—If he were, he would have somebody in England acting for him. There must be somebody in England to give instructions to the ship at Falmouth. If he is not here, he will be represented.

2217. And his representative would have to exercise the option?—Yes, somebody who is empowered to speak for the cargo. It does not matter who it is, whoever claims the power, and is recognised by the shipowner as having such power.

2218. What is essential is that the option should be exercised before the ship arrives, or before it is captured?—Yes. We do not want things hanging in the air as to whether a ship is going to a foreign port or an English port. Of course, the ship may be at that moment waiting at Falmouth for orders when war is declared. He must decide at once whether it is an English cargo or a foreign cargo. If it is an English cargo it comes under the scheme; if it is a foreign cargo it does not.

2219. And suppose it has been already captured somewhere in the middle of the Atlantic before he exercised his option?—I do not know whether it is conceivable that that should happen. I have not thought of that.

2220. It is not an improbable event, of course, in the early days of a war?—He has got to make his option immediately, the instant war breaks out. I do not see how a ship could be captured in mid-ocean without the man in England knowing that hostilities had already begun. Instructions could not be sent to a ship in mid-ocean. I do not see how it is going to arise.

2221. At any rate, he would have to exercise his option immediately on the outbreak of war?—Immediately. If this scheme is going to start in peace, to start at once, then the instant war breaks out everybody knows it, and the men who hold the bills of lading must decide immediately.

2222. After war has broken out?—After war has broken out he must not make optional contracts.

2223. (*Mr. Lindley.*) Might not the seizure of a boat in mid-ocean be the first act of war almost? In consequence of this Marconi wireless telegraphy, instructions might be sent out to a warship in mid-Atlantic?—Of course, it introduces a new risk. That is a possibility.

2224. It might be simultaneous?—It might conceivably be simultaneous. I confess I had not thought of it. In view of the contingency it might be advisable to exclude altogether cargoes carried with option of a foreign port of discharge. It would be reasonable and easy to do so.

2225. (*Sir George Murray.*) But this business of shipping to order, you think, would stop at once on the outbreak of war?—It would have to be stopped. If a man is going to be covered under the scheme, the bill of lading must be clear and precise, either for a British port or for a foreign port.

2226. In Section 14 you say, "the fund is to be liable for all losses under the scheme, affecting cargo, the error, neglect, default, or fraud of the master, agents, or owners of the ship notwithstanding." That seems rather a large liability for the fund to undertake?—It is a liability. I do not know whether in practice it would be a large one. I should think not. But if the fund is to have public confidence, you must have a liability. It is like the Forged Transfers Act with a public company. It is only a detail. Unless an English shipper or consignee is going to feel he is absolutely covered, he will have no confidence in the scheme, and the scheme will be disliked and criticised, and it will not go down. You must make the man feel he is absolutely protected, and that there is no loophole. The Government might say, "The owner defrauded us." The cargo-owner will retort, "I cannot be responsible for the captain; what could I have done? My underwriter would not have raised such a point as that."

2227. Would not he?—I mean to say it does not come into ordinary underwriting at all. You are introducing a new risk.

2228. That is what I was coming to. Why should you put the fund in a different position from an ordinary underwriter?—Because you are creating a special set of instructions, and therefore, to some extent a special set or risks, under this scheme, which do not exist under the ordinary method of working.

2229. But they would be exactly the same risks, supposing there was no fund at all?—I am assuming the risk here, where the captain holds out the ship to be an indemnified ship, when she is not, or when he disregards instructions, and sails when he ought not to sail. That ought not to involve the ruin or the loss of the merchant, who is relying on this scheme in good faith, and he cannot be responsible for the acts of the captain in another part of the world.

2230. I quite follow you on your second point, if he disobeys instructions, but if he misrepresents the character of his ship, is that a proper liability for the fund to indemnify?—It is not a liability that one would accept in the ordinary way, except, as I say, under the Forged Transfers Act, but here you have, we will say, a ship loading at Buenos Ayres, and the banker is asked to make an advance. He makes inquiries. He does the best he can. He turns up the Register of Indemnity, and he takes all precautions open to him, any precautions a reasonable man could take. All the time the captain is lying; the ship is not indemnified at all. He has skilfully and falsely represented that his ship is some other ship of the same name and about the same tonnage in the Indemnification Register. Is the merchant, for whom practically that banker is acting, to have no remedy at all in such a case as that? I say the scheme which creates the possibility of such a fraud must be its own antidote to it; it must indemnify him, or there would be no confidence in it.

2231. I should have thought he might have a remedy against the master of the ship, or the shipowner, but it seems to me very difficult to say that he ought to have a remedy against the British taxpayer?—I think he ought, and let the British taxpayer then take his rights against the shipowner for what they may be worth. You have got to swallow something in a scheme of this kind; you must deal with it broadly. If the British Government invents a new scheme it must take with its benefits any disadvantage which possibly may be incidental to the scheme. This thing which is pictured will not happen. Of course, there may conceivably be such a case, and I am providing for the possibility. I referred to it merely as a remote though perhaps possible contingency. If there is such a risk, we must take it. As soon as you begin to split hairs in a big scheme of this kind, the scheme will fall through. I say it with all respect.

2232. (*Chairman.*) It is a rather big hair?—No, I do not think it is.

2233. (*Sir George Murray.*) It seems to me it covers an enormous amount of possible fraud?—No, I do not think it. Where is the interest of fraud? Will you put a concrete case, Sir?

2234. Would there not be considerable interest in the master of the ship to pretend that his ship was indemnified, when it was not?—Not only would it be most difficult to perpetrate such a fraud, but the risk of punishment would be great. It has got to be a British registered ship, to start with, and the master is liable to fine and imprisonment. He will not do it without the instructions of his owners; that is quite certain. You can imprison his owners. And why should they do it? If people approve of the scheme, all the ships will be registered under it. If all the ships are registered under it away goes all the question.

2235. Of course, it would only be possible in the event of the shipowner having thought it wiser not to

Mr. D. Owen.

23 April 1907.

register?—Then you have got him here. He is liable to fine and imprisonment. Is the temptation sufficient? What is the temptation? I do not think anything of it myself, really.

2236. Then as regards deviation and delays, you do not make the fund liable for anything unless the delay amounts to as much as 30 days?—That is to say, a ship held up in port. If the ship is, under the instructions of the Admiralty, held up in port, it is at the risk of the owners for the first 30 days. If she is kept there longer than that, then the owners will be paid demurrage.

2237. Only demurrage?—Demurrage is, I suppose, a comprehensive term. The scale of payment would have to be fixed, and that would be the name for the scale of payment.

2238. But you expressly exclude compensation for damage to cargo, do you not?—That concerns the owner of the cargo. I am speaking of the owners of the ship. The owners of the cargo get nothing.

2239. And it would be only the ship which gets demurrage?—Only the ship.

2240. I think you say somewhere that that is not paid for now under any policy?—No. Ships constantly break down or put into a port of distress, and a ship that ought to make a voyage in two or three months, may take a year over it possibly. The cargo may have sustained great loss in that time. That is the loss of the merchant. The underwriter does not guarantee that the ship shall make the voyage in any time. That is the risk of the merchant.

2241. Is loss by delay never covered?—No. The only losses that underwriters are liable for are losses directly caused by perils insured against. They do not insure against delay. They insure against perils of the sea.

2242. Then I see you propose to allow a shipowner to insure against war risks to the extent of 10 per cent. above the actual value?—Yes.

2243. Do you think it is necessary to allow him as much as that?—10 per cent., of course, is quite an arbitrary figure. I think shipowners would perhaps say it is not enough. I suggested 10 per cent., as being in my opinion probably what would be sufficient.

2244. What does that margin really represent? Is it possible value to the shipowner himself owing to the peculiar circumstances of the moment?—I do not know. Shipowners always do over-insure. You may call it what you like. Broadly stated, they do always over-insure. Suppose they were only to get their actual value. They suffer a good deal of incidental loss; they have to wait while a new ship is being built; the market may have gone up against them. They want to insure against losses of that kind. Take a ship that cost you £10,000 yesterday, she is lost in six months' time, iron has gone up, and you have to pay £12,000 for it; therefore the shipowner insures her for £12,000. Underwriters know it perfectly well, and they have not the least objection. It is all done in good faith, without concealment or the least idea of fraud.

2245. Taking those figures, would not you say that the actual value of the ship at the moment of capture was £12,000 in these circumstances?—Of course, you might, but questions of deterioration come in. I am only stating broadly the principle. The shipowner wants to be on the safe side, quite naturally and properly. Then also he may have taken on a lot of coals. He does not consider they are sufficiently covered by the policy. He insured his ship perhaps in his own mind, as an empty ship, with only a certain amount of coal on board. For certain reasons he has taken three times the usual amount of coal. He may want to insure that specially, and if he does not, he wants the amount insured against the ship's loss to cover him. He will get it one way or the other. There is a good deal of vagueness about it, but he wants to be on the safe side, somehow or other.

2246. Of course, the larger the margin you allow in these cases of over-insurance, the more risk there is of defeating the object of the scheme. The object of the scheme is to prevent any rise in prices, or values, or freights, or anything of that kind?—Yes. It is not very much. Supposing a war premium is 5 per cent., and you allow a shipowner to insure for £110, instead of £100; 5 per cent. on £10 is not very much—10s. on £100, and of the ship only.

2247. *Pro tanto*, it diminishes the value of the scheme?—Yes; but the "tantum" is so very small.

2248. But you would agree that the smaller the margin it is necessary to allow, the better?—Yes. I quite agree with you in principle; only you have got to satisfy shipowners, and I do not think that a 10 per cent. increase on the ship insurance will hurt the principle we have in view.

2249. Do you allow cargo to be insured in the same way?—No, I do not think so, because those uncertainties as regards value of cargo do not arise. The value of the cargo is what it will fetch when it arrives, if it is sold on the market. We have to assume that if the cargo arrived all right, the man would sell it on the market at once. That is the price he is entitled to—no more and no less.

2250. Do you draw a distinction between the value of the ship and the cargo for that purpose?—Yes, because the cargo is going to be sold at once. The ship, which is a money-earning machine, never is. The cargo is coming here to be sold.

2251. Is the shipowner entitled to more than he would get if the ship was sold?—Yes, I think he is, because the mere fact of a loss involves him in incidental losses. If the ship is lost he has got to wait a year before he can get a new ship. He cannot go into the nearest market and pay so much for a new ship. He has to have it built, and all the time he is waiting he is losing the earning power of that ship.

2252. In fact, you would say the difference was that the ship was not meant to be sold and the cargo was?—Yes; and it is always a question what is the actual value of the ship. It is the same as in the case of a fire at your house; your stair carpet is destroyed. What is the value of a stair carpet? Is it what you paid for it originally, what you could have sold it for, what it is worth to you after it has been worn, or what it will cost to buy another one? What is the value? I do not know. So with the ship.

2253. But you do not see any difficulty in settling the value of the ship by this method?—No, so far as it is ever possible to settle the value of a ship conclusively.

2254. You think there would be no difficulty in settling the value of the ship?—No; the value of the ship has to be settled constantly in case of loss resulting from negligent collision.

2255. I should like now to ask you one question on your criticism of Schemes A and B. In Scheme A the persons entitled to claim indemnity are "The owner of any ship registered in the United Kingdom, and the owner of any cargo liable to capture, carried in such ship." Subject to what you say about colonial ships, I think you agree substantially with that?—Yes.

2256. The Colonial question, of course, must be left for further consideration?—Yes, I think so.

2257. Then as regards the cargoes to be covered, you say if the object is only to protect supplies to the United Kingdom the question will be narrowed. If it is also to protect our shipping against neutral competition, and our national manufacturing and exporting industries, then it must be widened, and you suggest that the cargoes to be covered by the indemnity should be cargoes to the United Kingdom from colonies and neutral ports, from the United Kingdom to colonies and neutral ports, and from neutral to Colonial ports?—No, I think we stop there—not the last.

2258. Those seem to be quite clear. I am not sure why you exclude neutral to Colonial ports or Colonial to neutral ports, except that that depends upon how far the colonies come into the scheme?—You see the object is primarily to indemnify cargoes to or from the United Kingdom. We are thinking of ourselves, our own country, and therefore it does not seem to me that we are directly or immediately concerned in shipments from neutral to Colonial ports. The colonies will look after that; it does not affect us.

2259. Except so far as they were in British-owned ships?—We are dealing simply with cargoes, not ships.

2260. Yes. Then you suggest that the capture and seizure clause should be amended. That we have already dealt with?—Yes, that we have discussed.

2261. Then we come to Scheme B, which you describe as utterly unworkable?—Quite.

2262. You say it is impracticable, because war premiums vary from day to day, and according to the nature of the risk. I think the scheme realises that, and I do not think it professes to meet the whole cost of insurance. It is merely an attempt to levy part of

the cost?—Then what part? I should want to see a sketch of the scheme. I say that on the facts before me it is utterly unworkable. If anybody thinks it is workable, let him draft it. Let us see a draft of it—the principle of it.

2263. As it stands, you think it is quite unworkable?—I am dead against it. It would be colossal.

2264. Suppose, instead of your fee on enrolment, you substituted a fixed premium at a very low rate, say, 5s. per cent., would not Scheme B, with that modification, come very near your own?—That only relates to ships. It is the cargo that would be the difficulty. As to 5s., I incline to think, offhand, that the average premium on cargoes is about 10s. Are you going to charge 50 per cent. or 5s., whether the ordinary premium is 5s., 25s., or 50s.? If you have a fixed premium per cent. for ships, or if you have a levy as I propose, I do not think there is anything in it; it is practically the same thing. I think my plan is the simpler, and it has other advantages. But the cargo is the difficulty. How can you possibly deal with the cargo under Scheme B? Ships you could deal with.

2265. The only difficulty would be that the cargo varies more often than the ship, I suppose?—If you think of what a ship brings; take one of these ships bringing 10,000 or 20,000 tons of cargo, split up amongst 200 or 2,000 different consignments, each of those 200 consignments, or whatever number there may be, having to be separately insured; if you think of all those to be dealt with in one office, all the ships coming from all parts of the world, thousands of people coming to insure, you would not have an office large enough to hold the people coming in. A man would sit there all day and all night, and not be able to see the underwriter. As it is, if you go to Lloyd's and want to see an underwriter, who is doing a big business, you see a regular queue of people waiting to call on him with their slips. You would want a place like the Albert Hall, and underwriters sitting all round it.

2266. No doubt, if you had a bargain between shipowner and undertaker, but, suppose you had fixed premium on cargo and ship?—I should like to see the uniform system.

2267. Do not shippers do something of the same kind now. Do not they take out a policy on cargo of any kind that they wish to ship in the next six months?—Yes, in certain cases, they do that under a policy at a fixed rate; it might be 20s. or 60s., whatver it would be. Of course the open policy may be for cargoes or shipments either for ships or for steamers. You see at once there are two classes of rate for that. Then the rate again would vary as to the nature of the steamer, or the nature of the ship. Then it would vary as to the nature of the cargo, and the risks the merchant decided to cover. When his declaration comes forward, then he knows at once, being in the habit of dealing with these things, what the rate should be, and he goes to his underwriter, one individual underwriter with whom he is in the habit of dealing, and he initials the declaration at a certain rate. I grant that the premium for war risks would not vary in the like proportion, but if you are to have all the merchants in London coming in to one man, the thing is absolutely impossible.

2268. No doubt, if they had to deal personally with the board, or whatever the body was, but could it not be done under some general system?—I cannot think of any such system to be workable. I thought it out to see if anything could be done, and I do not think it is possible.

2269. And it would not be possible for the shipowner to settle that with the shipper?—No, he does not know who his shippers are. Cargo comes by rail or water, from 2,000 or 3,000 miles off; it is put on board; he hardly knows what it is; he does not know who the people are.

2270. (*Mr. Beauchamp.*) The difference between your scheme and Scheme A is practically that under your scheme the vessel must be enrolled beforehand?—That is so; or, rather, it is an essential part of my scheme.

2271. I do not mean the details of it, but that is the main principle?—That is the principle of my scheme, certainly.

2272. What advantage do you see from the shipowner being obliged to enrol his ship ahead?—Because under this arrangement you get some control over the cargo. If you are going to impose on the nation the immense value of these cargoes, you want to have some say in what is going to done with the cargoes. You do not want them to be run into the mouth of the lion.

2273. But under any scheme of indemnity they would be obliged to place themselves under the control and direction of the Admiralty?—The ship would, or the cargo would?

2274. The ship?—I am assuming that.

2275. They would under any circumstances, whether enrolled or not enrolled?—If they are not enrolled they are not indemnified.

2276. Under Scheme A they would be?—Which is Scheme A? I am not quite clear.

2277. That is the free indemnity. Every British ship would automatically come under the scheme?—Yes. If you are going to make a compulsory scheme of it——

2278. Not compulsory. Any ship may come in?—But then, when a ship has come in, are you going to put her on the same footing as a ship that has not come in, or conversely? You must know what ships you are dealing with.

2279. On page 2 it says the owner of any ship registered in the United Kingdom is entitled to claim indemnity, but he has to comply with certain conditions, which are set out on page 4. Then on page 4 it states the conditions which have to be complied with?—It does not seem to me that this deals with the case where war breaks out suddenly, and ships are already at sea.

2280. Look at "N. B."?—What are those special provisions?

2281. Those would have to be worked out in detail afterwards?—I think they would.

2282. I do not see quite the advantages of the enrolment. If you have to enrol you get a good many of the difficulties which have been suggested to-day on the part of the shipowner and master, in holding out that he was an enrolled ship?—You may get rid of those, but I am inclined to think you would substitute others for them. It is very difficult for me to criticise a scheme that is not before me, but I think if I had your scheme before me, I could, as far as I understand them, show the dangers you were running.

2283. (*Sir George Murray.*) Would it not be practically your own scheme without the enrolment?—I dare say it would; but the enrolment plan is an essential of my scheme, of which the parts articulate. If you make and substitute other joints, I do not know how far they would articulate. But you do want, really, to have a firm hold on the shipowners, and also you want to raise money from them. Why is this to be done for nothing?

2284. (*Mr. Beauchamp.*) I was coming to that?—I should like to say I have worked out my scheme from my own point of view, and, of course, it may be capable of improvement, but it is very difficult for me to criticise a scheme that is not before me.

2285. But the broad features of it are before you. It is the details only which are wanting?—Well, so far as it is before me, I am against it. I think if you want to have a complete hold on a ship, you must have a scheme of enrolment. Of course, if you can show me a scheme under which that could be got over, away goes my scheme of enrolment, at any rate if the other is better. But the enrolment plan seems to have great advantages.

2286. Then you suggest that enrolment would bring in a certain amount of money?—Yes.

2287. Do you think the shipowner, in a time of profound peace, would enrol his ship, when he knows he can enrol it at any time just before the outbreak of war?—My impression is that in the way in which I have drawn this he has not got that option.

2288. (*Sir George Murray.*) You have given him a provision for late enrolment. He pays an extra fee?—Yes, but even in time of peace, to-day, he pays a premium. You do not insure your ships against war risks for nothing. Under my scheme he is not going to be able to hang back till the last moment and then come in on the cheap.

2289. (*Mr. Beauchamp.*) No, but every shipowner at the present moment would not come in, I suppose, and enrol his ship. At the present moment he does not find it prudent or wise to pay any premium of in-

Mr. D. Owen.

23 April 1907.

surance at all on his ship against the risk of capture?—You mean shipowners generally are not paying?

2290. Shipowners generally?—I think if that is so, it is because they will not pay the premium that underwriters ask.

2291. Yes; I know it is quite a small premium, but very few shipowners insure against the risk of capture?—When a shipowner insures his steamer for time you ordinarily include war risk.

2292. Oh, no.—You do not?

2293. Oh, no; most exceptional.—That is to say, you are going to charge an extra premium if he insures?

2294. If he insures.—He would like to insure, only he does not like to pay the premium you would charge.

2295. He will not pay the small premium of 2s. 6d.?—2s. 6d. My scheme is based on 2s.

2296. You are going to force him to pay?—I am going to force him to pay 7d. on the exercise of his option to come in. If you were going to say to the shipowner, instead of charging you 2s. we will charge you 7d., and give you a full policy, do not you think they would come in?

2297. I think they might, but I am not sure?—I think they might, too, from what I know of shipowners.

2298. With regard to that part of your scheme relating to the National Board of Claims, in the first place you have got a Board of Claims, then you are going to allow the shipowner to go to the Court of Appeal, under Section 3, and then when you get to Section 18 you say, "In the event of the failure of the Board of Claims to agree with shipowners as to the actual value of the vessel, the question shall be referred to a committee to be appointed by the Trustees." Is that interposed between the Court of Appeal and the Board?—I think when I was speaking of the Court of Appeal I had in my mind the ordinary case of judgment in a suit, where the shipowner claims to be paid, and the Board of Claims refuses on the ground of non-liability to pay him. Then the shipowner says, "Very well, I will appeal against your decision." But in fixing the value of the ship, the Court of Appeal would not come into that at all. The Board of Claims has simply to arrange what the value of the ship is, and if they cannot settle it, very well, then refer it in the ordinary way.

2299. (*Mr. Lindley.*) You mean the ordinary reference by "The Court of Appeal"?—Yes, the ordinary reference.

2300. (*Mr. Beauchamp.*) Then with regard to the stamp duty, your suggestion is that the 3d. per cent., or the stamp duty, should go to this fund?—My idea is this: I am putting shipowners out of it for the moment; they are to pay no stamp duty. I do not know whether it is right to put owners out of it, but for the moment I am putting them out.

2301. I do not see how you are going to exclude them?—For the moment I have left shipowners out: I am not sure what you intend by "how." But dealing with cargo, it seems obvious that if you are going to indemnify cargo that is going from the United Kingdom or coming to the United Kingdom, that will be a very great advantage to cargo. They will not have to pay anything for war risks in time of war or peace. I say why should we give them that for nothing? Let them go on paying their stamp duty. If the stamp duty oppresses underwriters in any particular point, that can be modified, but simply dealing with it in principle, let the stamp duty continue to be collected on cargo for those protected voyages, and then let the Inland Revenue pay over the amount whatever it is—£50,000 or £100,000—to Government to support the scheme. It will not cost the cargo anything. It will cost the cargo exactly what they pay now, only instead of the duty they pay going to fiscal purposes, it goes to this scheme.

2302. Then the cargo owners, whose premium is over 2s. 6d., would be paying really to indemnify the owners of the cargoes whose premium was under 2s. 6d., because they only pay a penny for the whole amount that they insure?—I contemplate the duties as now fixed: certainly I have no thought of increasing them. Any little inconvenience of incidents of that kind can be adjusted. The bulk of the cargo that comes would reasonably be expected to pay 3d. per cent., or whatever figure you like to put it at. I am only dealing with the principle there; any necessary details would have to be worked out.

2303. Then you are going to exclude bonds, and gold, and silver?—I do not attach any special importance to that. I felt it was necessary to exclude some of these things, and so I made a comprehensive clause, because bonds are not necessities of trade.

2304. Are they not? If you want to raise money you have got perhaps to sell the bonds here, and you get your gold from abroad in order to pay?—That is a question of finance rather than of supplies. I do not mind; I think it better to leave it out myself, but still it is a detail. What we have to keep in mind all through is the main object, which is dealing with supplies and raw materials.

2305. But then you are going to put a provision in the Act that "In all British policies on vessels enrolled under the scheme, and in policies on freights by such vessels, and in all policies covering goods on board enrolled vessels," etc., you are to have a clause that the underwriters are warranted by the assured "Free from risks of the King's enemies." What is the object of putting that in? Is not that going to raise the very doubt in a man's mind, whether he will get his payment from one or the other?—It is merely that I thought it should be perfectly clear and plain what the position was.

2306. Do not you think it would be better to leave the original policy as it is?—Yes, if the position will be clear. In any case I do not suggest that the policy shall be altered. It is only that the Act should make it clear.

2307. And to indemnity the shipowner from certain risks which are ordinarily included in the policy, but excluded by the f.c. and s. Clause?—Yes. Would you be kind enough to read it?

2308. "Clauses shall be implied in the following sense"?—Yes, implied. I would not put anything in the policy.

2309. If it is implied, it is almost exactly the same thing?—It is, in effect. Then it would be implied. That is the object of the scheme, that the underwriter is not to be liable.

2310. But the underwriter is in some circumstances going to pay the claim first, and then proceed against the fund, if there is any doubt about it?—Then, if he is paying, he is paying because of a sea risk, not because of a capture risk. I am only dealing with capture risks.

2311. But do you see any advantage in putting it in?—Would you kindly tell me where it is?

2312. It is on page 8, Section 24, Sub-section A?—I think my main idea was that it should be made perfectly clear what the underwriters were now to be relieved of, and what the scheme was to be liable for. I had in my mind that by inadvertence the capture wording, which is mixed up with other wording, may be left standing in the policy, and that, this inadvertence notwithstanding, the Act shall relieve the indemnities of risks taken by the State. I do not think I had anything more in my mind than that. That will be the position; the Act will imply it, only it will not imply the exact words.

2313. But this is to be provided for by the Act of Parliament?—I think it is right myself, but it is one of the details which might perhaps be further discussed. I do not attach any great importance to it. My only object was to place the position of the underwriters beyond doubt.

2314. (*Mr. Lindley.*) The main difference, as Mr. Beauchamp has said just now, between your suggestion and Scheme A, is really that question of enrolment, but I do not see in your scheme any suggestion with regard to notice being given by the cargo. Are the cargo owners to give no notice at all?—No, I think not.

2315. Enrolment by the shipowner carries the cargo with it?—Carries the cargo with it.

2316. Under all circumstances?—Under all circumstances, as far as I can see.

2317. Supposing there is any cargo carried in ships that are not enrolled, although it is British property, and intended for the United Kingdom, is there any option on the cargo to give notice?—No; cargo is not covered. That is one of the levers to force the shipowner in.

2318. Because, otherwise, cargo will not be carried in his ship?—Exactly. That is where you have got the shipowner.

2319. You refer in part of your scheme here to payment for demurrage after a certain date, that is where the vessel is detained. If that is allowed to the ships, why should there not be a question of loss of interest or loss of market to the cargo after a similar date? Why discriminate?—For this reason; not as a matter of logic, but as a matter of practice and convenience. We all know what the loss to the ship is, it is reduced to a scale, 4d. per ton, or whatever it may be. But it may actually be a gain to the cargo.

2320. Yes, I quite understand that, but what do you say as to the question of loss of interest, for instance?—The cargo itself runs those risks.

2321. Yes, so does the ship in its way, with regard to demurrage?—The shipowner can insure against demurrage, if he likes, with his clubs, but the cargo owner has got to run that risk, and he runs it every day. Sometimes it hits him very hard, as you know. It would introduce an element of confusion and, indeed, of novelty.

2322. On page 17, No. 17, you say, "The liability of the fund shall be limited either to the actual value of the property, or to the value declared and insured under the policies, if any, against sea perils, whichever value shall be the less"?—Yes.

2323. Suppose, by some chance, as very often happens with large liners, the vessel is very much under-insured?—Am I speaking of cargo, or ship, or both there?

2324. Both, I think?—I dare say I had both in my mind. I say, if the ship is under-valued. I meant under-valued.

2325. Yes, you say under-valued?—What page is that?

2326. Page 7. You use the word value. "Or to the value declared and insured under the policies." Take the case of a vessel really worth £400,000, insured for £250,000. As you know, we have had it?—Yes.

2327. What do you propose there with a Government scheme?—"The liability of the fund shall be limited either to the actual value of the property, or to the value declared and insured."

2328. Of course, you know the reason it is done. I mean, supposing there are no further insurances beyond the all-risks insurance?—Cargo we are not discussing. We agree with cargo.

2329. No, I do not agree with cargo, but we will take the ship first?—Very well. The ship is insured for £100,000, valued at £100,000.

2330. Yes, worth £150,000?—And I say that the scheme shall only be liable for £100,000.

2331. Is that quite fair?—If it is good enough for the shipowner to run his own risk for £50,000 in ordinary circumstances, why should he not run it here? Why should we put him in a better position than he is in under ordinary circumstances? If he will only get two-thirds of his loss if the ship is lost under an ordinary policy, why should we give him the extra third just because under this scheme he is dealing with the State instead of with his underwriters?

2332. Practically that comes back to this, that if the vessel is not insured at all there is nothing to be paid. Is that the logical result?—Yes, it is something very like it.

2333. Surely you could hardly bring that in?—Yes; I see that creates a difficulty. On consideration, I think that probably this limitation, in the case of ships, should be dropped. Logically, I think the proposed limitation is right, but I see the difficulty. An uninsured shipowner would no doubt argue that because he chose to be uninsured against sea perils was no reason why, in the event of hostilities, he should not decide to insure against capture risks. I do not know whether he would so insure or not, but I think that he ought perhaps to have the full protection of the scheme. I am obliged to Mr. Lindley for calling my attention to the point.

2334. And with regard to the cargo, the same thing might apply, although there is less difficulty in getting at the value of the cargo?—Would you mind putting a case about cargo?

2335. Take the case of cargo insured based on an invoice price, with a percentage of profit, and a sudden rise whilst at sea?—Or a sudden fall.

2336. Or a sudden fall. In the case of a sudden fall we only pay the actual value?—Suppose property is lost by ordinary shipwreck, the man only gets his policy value.

2337. Yes; he has paid a price for that, and knows what he is doing?—Why should he get more out of us?

2338. Because we propose to reimburse him for what he has lost?—But I should not, if he insures himself for less than the value.

2339. There, again, you come back to the point that there is nothing to be paid if the owner does not insure at all. There are many people who do not?—Yes. I have not thought of that point. Of course, it does not often happen, but I do not know why we are called upon to make presents. The case of the ship and of the cargo are entirely different. It is, however, not at all an essential or important point. If it be preferred, by all means pay the cargo owner his actual loss quite apart from any value set on the goods for marine insurance purposes. There is not much in it.

2340. Then why limit the shipowner to 10 per cent.?—The figure is adopted by me merely as such, though representing my personal idea. The shipowner will probably say more than 10 per cent. You may say 15 per cent., somebody else may say 5. I think 10 per cent. is probably a reasonable amount.

2341. Do not you think it may be left to the shipowner to say how much should be covered? The underwriter will be sure to see him through, if he knows he is going to have the actual value of the ship refunded to him. It seems to me reasonable to allow him to make a bargain for somebody else to recover something more?—It all finds its way through the cargo to the consumer in the long run. I think 10 per cent. is high enough; but if I had before me a clause in a different sense I should have something to criticise. This must always be kept in view—that the shipowner shall not be in a position by reason of his insurances, over and above the State indemnity, to desire, as a money proposition, the capture of his ship. The moment you put him in such a position you remove from the Indemnity Fund one of its most important safeguards.

2342. (*Chairman.*) You yourself have said that there are, of course, two objects which are contemplated by any scheme of this kind, the maintenance of our mercantile marine, and the maintenance of supplies of food and raw materials, necessaries, at low rates?—Yes.

2343. And you point out that according as our direction is tending to one or the other, our scheme may be wider or narrower. I have not yet gathered which, in your opinion, is the more important of the two?—They are both of them so vastly important. They are two of the most important subjects affecting this country in time of war. You are asking me to choose between my purely academic interest in the shipowner on the one hand, and my actual sympathetic interest in the wage-earners on the other, and it is a very difficult choice to have to make.

2344. But I may take it that you consider it equally necessary to provide for both of them?—Certainly I do.

2345. You are equally afraid of the transfer or destruction of our mercantile marine?—Yes; I would not mind saying almost more afraid.

2346. More afraid of that than the effect upon prices?—Yes. I am afraid of the effect of a war on our great national industry of shipping. That is what I am afraid of.

2347. That, perhaps, explains the suggestions that you made to revive the Navigation Laws and put a cargo tax on neutral vessels, if that had been possible?—Yes, it is all purely with that view.

2348. As far as that had an effect, it would rather militate against your second object, would it not?—One would require to consider the question at greater length, but I do not think, really, it would.

2349. You do not think that the exclusion of foreign competition to that extent would materially enable the British shipowner to raise freights?—I do not think so, because you are introducing all at once all our vast tonnage into it, and the competition of our vast tonnage would keep it down.

2350. Does not the very vastness of that tonnage

Mr. D. Owen.

23 April 1907.

put a great obstacle in the way of its transfer to foreign flags?—It puts certainly an obstacle in the way. I do not know whether it is a great one, but I grant it would be an obstacle. Then you may have these other nations, who have not got large merchant fleets, concentrating on a particular branch of our trade, and you do not know what damage they may not do. Some of our shipowners live simply on a certain trade, and if they were to have a lot of foreign competition concentrated on that trade, it would ruin them; they would sell their ships, or might. I do think that the present position is a most dangerous one for our national shipping.

2351. That leads me to another consideration. You propose to exclude from the benefit of the indemnity voyages between foreign ports, or between colonial ports and foreign ports?—The cargoes, not the ships. Of course, the ships are covered all the time, wherever they may be.

2352. But might not the obtaining of cargoes on those lines be of great importance to the profitable and normal working of the particular ship?—It might, but in a scheme of this kind you can only proceed on broad lines. In the desire to provide for everything you may overload the scheme or go too far.

2353. I have in mind, very vaguely, I admit, the case of a tramp steamer which takes a cargo out from here, let me say, which you would wish to enable her to secure, but the freight that she has to charge on that cargo is conditioned by whether or not she can get another cargo on?—That is quite true, but I think we have got to draw a line somewhere, and I thought to draw it there. So long as we keep on those two main lines, cargo from the United Kingdom out, cargo to the United Kingdom home, then we have got a simple scheme. I quite see your point. I am very much in sympathy with that about the cross voyages, but you must draw a line somewhere.

2354. Have you formed, in your own mind, any idea of the risks you are asking the State to undertake?—Do you mean the nature of the risks, or the magnitude of the risks?

2355. The magnitude?—Of course, that depends upon whom we are at war with, how long the war lasts, and so on.

2356. Have you, in your own mind, ever conceived of a particular great naval war in which we might be engaged, and set yourself to consider what were the probabilities of losses that the State would have to pay under such a scheme as yours?—No, it is impossible. In my opinion it really would be misleading, and would not be worth giving. I have got a floating idea at the back of my mind, but it is not really worth quoting.

2357. You would admit then that for the State to undertake these risks would be a great leap in the dark?—As to the amount, yes. In the same way, if we go to war, it will be a great leap in the dark as to what the consequences will be on our industries and manufactures. The whole thing is in the dark.

2358. But your real defence, I suppose, would be that whatever the loss is it will have to be borne by the country somehow?—Precisely, and more, because you see the underwriter who insures has got to pay all the cost of his machinery, and he has to get his profit. I suppose you may take the two together at 25 to 30 per cent. Assuming that 20s. is the real cost of the risk, the underwriter is going to charge what, on that? Twenty per cent. more, at least, to pay him his expenses and his profit, say 20 per cent. to 30 per cent. at least.

2359. Assuming those figures. I will take any figures as to what the underwriter may have to charge for it, do you think a State Department will work the thing more economically?—Yes. The profits will come out, and the costs of working.

2360. That is true; the underwriter's profit will come off. I am not speaking of the profit. I am speaking of the actual cost?—To work a marine insurance company the costs range from 10 to 30 per cent., I suppose. It varies; of course, the bigger the company the lower the ratio comes, but I should think you may call it 20 per cent. I am speaking from memory, but I should think marine insurance companies do not work much under an average perhaps of 15 per cent. Call it 15 per cent. It is not going to cost the Government 15 per cent. to work a thing of this kind. There are no salaries to pay. Then against that, under my scheme, you are getting in the fees from the shipowners, and stamp duties from the cargo owners, which together would bring in £100,000 a year. If we have a continuance of peace for a dozen years, you will have in hand a very large sum to pay your losses. We have gone for a hundred years without a naval war. May I put this to you, Sir? Supposing we had started this scheme a hundred years ago, on my lines, the country would be none the poorer, and we should have had a fund of how many millions? We should have said, "You may capture what you like, and it will not hurt us."

2361. That is another point about which I wish to ask you some questions. What do you propose to do with this fund? I understand it is to be vested in a Government Department, practically in the hands of trustees?—Yes.

2362. Are they to invest it?—Yes, deal with it as a business matter, and make what they can out of it. They may buy Consols, or do anything with it.

2363. On the whole, probably, it would earn more if it were left in the pockets of its individual owners than if it were invested in State securities?—I dare say it would. But the individual owners we are considering are the individual consumers and manufacturers.

2364. Do you think that the country would be content to see any very large guarantee fund of this kind locked up for an indefinite period?—There we get into finance. I should refer that to the Chancellor of the Exchequer.

2365. Yes; the temptation to him would be strong?—I do not know what he might not do.

2366. Have you considered also that when a war occurs, if there are heavy losses, and this fund has to be realised to pay the losses, the Chancellor of the Exchequer must sell the investments in which he has placed it?—No, I have not considered that at all. But the money has got to be found somehow by somebody.

2367. You see that that comes to just the same thing as if the Chancellor of the Exchequer were borrowing more money in the market?—Yes. When war comes, if you have heavy losses, the marine insurance companies have got to sell all round. We have seen that about San Francisco. Somebody has got to pay for the stuff that has gone, whether the Chancellor of the Exchequer does it or somebody else. The money has got to be found. There will in consequence be a great fall in the value of securities. The State will at any rate be no worse off if it has a large fund in hand against which to write off the loss resulting from a forced sale. That will be one of the advantages of the creation of a fund.

2368. One of the strongest objections which is constantly repeated to us by witnesses against any State scheme is the risk of fraud on the State. I gather that you feel no difficulty about sufficiently protecting the State?—I do not at all. Of course, you can never eliminate fraud from anything. I have heard of people even cheating the Chancellor of the Exchequer about their income-tax.

2369. Yes, that is not unknown?—You have got to run a certain amount of risk of fraud. Underwriters are cheated, no doubt.

2370. It is suggested to us that underwriters are cheated to a certain extent, but that the State would be liable to be cheated much more?—Certainly it would, if the State acted through its ordinary machinery, but here you would have the underwriter's machinery. You would have keen, able men. You can tell, you can smell when a thing is in order, or, rather, when it is not.

2371. Have you considered whether you could get these experts to give this voluntary service?—I was the secretary of a marine insurance company for a good many years, and I should have been very proud to do it, and I feel sure my colleagues would, partly because it would be a certain distinction, and partly because the marine underwriter is not the least patriotic man in this country. He would be only too proud to do it.

2372. I was not doubting their willingness, but whether it would be possible for them to do it. *Ex hypothesi*, they are very busy men in normal times. You want the best men in the profession?—A man is never so busy as to leave undone what he really wants to do If he wants to do it he will do it. If he does not

want to do a thing he will never fail to have a good excuse. The company would say, "By all means, Mr. So-and-so; but I am afraid it will mean a great deal of extra work for you."

2373. You do not think the directors would say, We should be very glad to give you leave, if we could, but this is a time of peculiar anxiety in the conduct of our own business, and it is just the moment when we can least spare you?—No, it would not be so. It would be a time of peculiar anxiety to the underwriters, but not to the examiner of claims, who is, moreover, always provided with an efficient deputy. Besides, the directors of our great insurance companies will be eager to give every help in their power.

2374. As you say, underwriters even now are subject to some fraud occasionally?—Yes, occasionally.

2375. And they protect themselves against that to a considerable extent, first, by their expert knowledge of the business they are doing, and then by their personal knowledge of the people who come to them?—Yes, to a considerable extent, no doubt that is so—the personal knowledge. But persons inclined to fraud are afraid of the companies' watch-dogs, the examiners of claims.

2376. There will be occasions when somebody, having been singularly unfortunate, without definitely making imputations, they will say, "He is too unfortunate for me to insure"?—I quite understand. If you were to ask me to name anybody of the kind, which, of course, I should not do, I should have a difficulty about it, but if his name came before me, I should say, "Hullo, what is this about you?" If you have nine examiners of claims, there will be two or three who will say, "Hullo, here is old So-and-so turned up again; we must look into this."

2377. But would looking at it be sufficient after the event?—After the event, but before the payment of the claim.

2378. But I put it to you that the underwriter's protection is that he does not underwrite in such a case?—I do not think the underwriter often refuses on the ground of suspicion. When the risk is put before the underwriter, in very many cases he does not know whose it is. He takes the risk, and relies upon his strong right arm to protect him; in the case of a company, the examiner of claims.

2379. You agree that the opportunities for fraud, or the doubtful cases in war would be much more numerous than in peace?—Not with the safeguards I have suggested here.

2380. In the time of the great Napoleonic wars, there was a good deal of throwing away of ships, was there not, in order to evade the Berlin Decrees and our own Orders in Council?—Yes, I daresay there was, but that would hit the underwriters. Doubtless they wrecked their ships on purpose, and the underwriters paid for it, and you could not find it out. That we are not going to pay for. We are only going to pay for capture.

2381. But I meant throwing ships away, not merely by running in shore, but running into the hands of the enemy; at any rate, not being studious to avoid them?—Yes, I have no doubt it may happen in every war, if a man insures. In those cases a man would not do it unless he knew he was very heavily over-insured. We are going to stop that.

2382. Not necessarily, I think. He did it in those days not because he was over-insured, but with some secret arrangement which allowed him to get the benefit of the high prices prevailing on the Continent.—He might; I do not know. But one thing is quite certain, and that is, that, assuming the case of a shipowner who is dishonest, he is not going to lose his ship unless he knows he is very well insured. The pecuniary inducement to fraud will be wanting, on the one hand, and on the other the owner who acts contrary to the scheme will expose himself both to forfeiture of the protection of the scheme and to penalties. He will have nothing to gain and a great deal to lose. Here we say, "You are going to get the actual value of your ship, to be ascertained by experts, and at the most, 10 per cent. in addition, and if there is any hanky-panky on your part you will drop into a very uncomfortable position."

2383. I see, you are not content to take the value at which the ship is insured for marine perils?—No, certainly not.

2384. You admit that that might be much too high?—Oh, yes; it nearly always is. Some ships are greatly over-insured, to the knowledge of the underwriters. Underwriters, for legitimate and well-understood reasons, like them to be over-insured.

2385. Therefore, practically, you are reduced to saying it is to be the value ascertained by a committee of experts after the loss has occurred?—Yes. The Board of Claims will have a pretty shrewd knowledge of the value of a ship. They would say, "Now, Mr. Shipowner, what do you say is the value of your ship?" He would say, "That ship was worth to me £50,000." They would say, "No, we do not think that. We have reason to believe £45,000 would be the outside amount of your loss." He would say, "No, £50,000." They might say, "No, we will not pay a penny more than £45,000," and he might come back and say, "I will take the £45,000 rather than have the bother of an arbitration," or, "Cannot we split the difference?" But if they felt they cannot do that they would say, "Very well, we will refer it to the Committee, and you must take your chance. You might not get so much as £45,000."

2386. From your experience you see no difficulty in finding out values?—I would not say there was no difficulty. There is always some difficulty in fixing the value of a ship, but it is quite possible to get at a fair value. Whether it would satisfy the shipowner is another thing, but it would be reasonably fair. Mr. Lindley would be able to tell you more about that than I can.

2387. Of course, under any circumstances, what you do under a scheme of this kind is to indemnify the shipowner who has lost a ship, and the owner of the cargo, who has lost his cargo. You do not secure the arrival of the cargo in this country, or the safety of the ship?—No, you cannot do that.

2388. How, then, would you keep prices down?—You cannot keep them down. You have got to see it through, to see what happens. All you can do is to keep it down by avoiding the increase of war risk saddled with charges and profits, and the tradesman saying, "Oh, I saw yesterday at Lloyd's there was a regular panic, and I know the war risk is 5 per cent. to-day. It will be 10 per cent. to-morrow; I am going to put up the price of my sugar." He will take good care to be well on the safe side in anticipation of future increases. He will use the excuse for all it is worth.

2389. Yes, but what I suggest to you is that the insurance rate, the 5 or 10 per cent. paid for insurance, would be the smallest part of the considerations which are affecting his mind?—I should think it would be the smaller part.

2390. The insurance would go up, because a ship has been lost, or several ships have been lost?—Or because they are afraid that they will be lost.

2391. Yes. If the cargo arrived safely the insurance rate would fall down again very rapidly?—No, I do not think so. It may be going up all the time.

2392. In spite of all the cargoes coming safely in?—Yes; you cannot say. It is an absolutely uncertain element. There may be some new shifting of the theatre of the war, drawing off warships to somewhere else, or something of that kind. It is uncertain. But I quite agree with you that the premium is the smaller part of the incident in the increased value of suplies. Of course, the prime incident is that you do not get your supplies. If you do not get your supplies, that is the thing, and that we cannot insure against. All we can say is, to some extent we shall not get our supplies, and to some extent the supplies will all be made dearer by the insurance premium, and all we can do is to take that insurance premium burden off. If an artisan is paying 20s. a week for imported food, in round figures, and his wages are only about 17s. or 18s., or perhaps a sovereign, and to-morrow he finds food has gone up 5 per cent., and he has to pay a guinea, and the next day it has risen, and he has to pay twenty-two shillings, it may be a small part, but it is the last straw.

2393. I think you are as strongly in favour of some scheme as any witness that has come before us, or as anyone whose writings on the subject I have seen. I am, therefore, pressing upon you rather the objections which have come from those who take a different view?—Yes; I want to meet the objections. I should

Mr. D. Owen.

23 April 1907

like to have had all the objections possible. I did think out all I could.

2394. I saw you did, and I am obliged to you. But I take it, without abating in any degree your desire for a scheme of this kind, you admit that the protection it will give to the consumer is only partial?—It will not bring cargoes, that is certain.

2395. And that the risk which it will impose on the State is incalculable?—I mean we cannot calculate it.

2396. It is not infinite, but we cannot calculate it?—Yes, I admit that necessarily. But the pecuniary risk to be imposed upon the State will be a less risk than would otherwise be imposed upon the country.

2397. If we were assured that there was no risk of the transfer of our Mercantile Marine, or of its being laid up, would you still advocate a scheme purely for the purpose of securing our necessaries?—Yes, I think so.

2398. And equally, if we could remove your anxiety about the necessaries, you would advocate the scheme in order to preserve the Mercantile Marine?—Yes, unless we cut ourselves adrift from the particular clause of the Treaty of Paris. We ought to do one thing or the other.

2399. Then, in your opinion, the alternatives are between some scheme of national guarantee, and a denunciation of the Treaty of Paris?—Yes, a revival of the Navigation Laws, and so forth. I should not like to pledge myself off-hand, and say that the Treaty of Paris ought to be denounced. That is what I feel, but I have not come here to express an opinion upon it, and I should not like to say off-hand. At this moment that is what I think, that we ought to cut ourselves adrift from it.

2400. But, at any rate, assuming that we do not cut ourselves adrift from it, then you hold that nothing will make us reasonably safe except a scheme of national guarantee?—Coupled with a scheme for protection of our shipowners. What we want to do is to penalise neutral ships. Of course, if we cannot do it, owing to treaty obligations, then that part of my scheme falls away. But we ought to do it, or else we ought to do away with the Declaration of Paris, one or the other. That I am quite sure of.

2401. Do you think there would be any difficulty, at a rate, in insuring the whole of the British Mercantile Marine in case of war?—Ships and cargoes?

2402. Yes?—With whom?

2403. With private underwriters and companies?—You mean, in case a war broke out, would people be able to place their risks?

2404. Yes?—That is one of the unsolved questions. You see, as the result of this Japanese War, and the very heavy losses sustained by one or two companies, there has been something like a scare amongst marine insurance companies, and how that would operate if war occurred again I do not know. The directors might say, "Oh, no, we had an example of what happened to such-and-such a company, and we cannot run the risk of losing £200,000. We cannot absolutely refuse risks, but keep them down to the lowest possible figure. You will understand that, Mr. So-and-so," to their underwriter. He might say he thought they were doing the wrong thing, but, however, the risks would be kept down as instructed. It is conceivable that there would be great difficulty in placing the risks, in consequence of loss of insurance market.

2405. It has been suggested to us that the higher the premium, the smaller the market for war risks—that is to say, the higher the premium is the greater the risk is supposed to be, and the smaller the number of people who are willing to take it?—It is rather like this, that if you have a particularly choice interest to insure, specie, for instance, where the rate is nominal, anybody will be thankful to write it, but, assuming you have a rough cargo, or an uncertain or peculiar risk, on which you have to pay as many pounds as you have pence in the other thing, you have a limited market at once. There are, too, plenty of companies competing for ordinary business, but which are not in the market for extraordinary business. There are now no data or underwriting statistics on which to base war premiums in time of war, and there are a lot of cautious underwriters and companies which will keep out of the business for that very reason. It is notorious that a lot of underwriters got very hard hit indeed owing to the unexpected happening in the Japanese war, and it will be long before this object lesson is forgotten. Company directors will play for safety.

2406. But as to what would happen, either in the insurance market or in the matter of capture, if things were left to themselves, you feel it is impossible to give a forecast?—Nobody can forecast.

TWELFTH DAY.

Tuesday, April 30th, 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, Bart, M.P.
Sir GEORGE SYDENHAM CLARKE, K.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Captain C. L. OTTLEY, R.N., M.V.O.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. WILLIAM GOW, called and examined.

Mr. W. Gow.

30 April 1907.

Mr. Gow, in a preliminary memorandum,* had submitted:—

(1) That it is doubtful whether a national indemnity would secure our oversea trade, and steady prices in time of war.

(2) That conditions of supply and demand, rather than the amount paid as war premiums, are the main factors in the rise of prices in war time.

(3) That no national service is rendered by payment of indemnity in case of loss, but only by actual safe delivery of cargo.

(4) That the cost of a free indemnity would be serious, and that the inspection necessary to prevent the transfer of goods to British ownership would be extremely onerous, and might impede business.

(5) That the special difficulties under a free indemnity would be the prevention of undue risks, fraud, and the exercise of efficient control.

(6) That insurance by Government would not necessarily be cheaper than insurance by underwriters, and might be dearer.

(7) That under any scheme of limited Government insurance, the more desirable risks would be taken by the underwriters, while the more perilous ventures would be left to the State.

(8) That certain alterations and additions are, in any case, desirable in the event of the adoption of Scheme "A" or "B."

(9) That encouragement might be given in time of war to the import of food supplies and raw materials, and to the export of manufactured articles, by the repayment on safe arrival of the amount expended on war insurance.

* *Vide* note, p. iii.

2407. (*Chairman.*) You are the underwriter of the Union Marine Insurance Company, of Liverpool?—That is so.

2408. May I ask you whether you have had a large experience of underwriting war risks?—I had experience in America during the Spanish-American War, when I was New York representative of the London Assurance, and I had experience in the Russo-Japanese War pretty extensively.

2409. You have seen the reference to this Committee?—Yes.

2410. And I gather from the précis, which you have been good enough to send me, and from your opinion before Lord Balfour of Burleigh's Commission, that you are opposed to any scheme of national guarantee?—That is so.

2411. The first of the objects which such a scheme is intended to secure is the prevention of any interruption of the activities of our mercantile marine during war. You do not anticipate such an interruption?—There would be an interruption, but I do not see how it would be overcome by a system of national guarantee.

2412. It has been suggested to us that the rates of insurance against the war risk might rise so high that it would be no longer possible for shipowners to profitably employ their ships?—On the other hand, I have been told by men experienced in large markets, the cotton market, for instance, and the grain market, men who have known those markets since the time of the American Civil War, that the rise in price which would occur in the produce handled in those markets would be incomparably greater than any amount of war premium that could be imagined.

2413. I will come to the freights later, if I may. For the moment I wanted to direct your attention to the shipping. Is it not conceivable that produce might, as you say, rise very high for entirely different reasons, but that yet the advantage of shipping in a neutral bottom might be so great as regards both risk and cost, that our shipping would be unable to find freight?—I think that is so.

2414. That is certainly what has weighed with a good number of the witnesses who have come before us to advocate such a scheme. Supposing that were the case, the British shipping that was unemployed would be forced either to lie up or else would be transferred to a foreign flag, I suppose?—I am not quite sure about the transference to the foreign flag. That would depend upon the law of the country to which the tonnage was transferred; and it would depend upon the law that might prevail here at the time regarding transfer. But there is no doubt there would be, anyhow at first, great additional employment of neutral tonnage.

2415. To the detriment or exclusion of British tonnage?—Certainly.

2416. It would be, I suppose, to the interest of the neutral to facilitate transference to their flag?—Yes, I think it would be.

2417. And quite conceivably it might not be to the interest of the belligerent, our enemy, to examine the *bona-fides* of those transfers too closely?—I do not quite follow.

2418. Supposing we were at war, and owing to the circumstances which we have been discussing, considerable transfers of British shipping were made to the American flag, it would not be in the interest of the other belligerent to quarrel with the United States?—Put in that way I understand it.

2419. And they might be satisfied therefore with the loss inflicted upon us by the transfer of our shipping, without trying to follow up that shipping after it had been transferred?—Possibly.

2420. Do not you think that the facilities for such a transfer are greater in these days than they ever were before?—I do not know. I do not know the comparative state of the law.

2421. Apart from the state of the law, I was thinking of the commercial conditions rather. I put to you that there are greater aggregations of capital now than there were 100 years ago, and that therefore a *bona-fide* purchase of a large quantity of shipping would be much easier to arrange now than it would have been 100 years ago?—I think that is possible. At the same time, one must not forget that what one might call the shipping community is a much more extensive machine than it was 100 years ago, so that after all, comparatively, perhaps, there would not be so much greater means of transferring from one flag to another.

Mr. W. Gow.
30 April 1907.

2422. I have in mind such a combination as was effected in the Atlantic trade a few years ago. Anything approaching that or even proportionate to the then extent of our mercantile marine would have been impossible, I should think, or at least very difficult, in the great war?—Yes, I think it would have been. If I might suggest, the thing that strikes me so curious about that combination and about possible transfers to America, it is that the American law is peculiarly strict nominally respecting transfer. Whether there would be equal connivance at transfer in the case of a war in which we were involved, one cannot tell.

2423. But you agree that the difficulty is rather in the state of the law than in the magnitude or difficulty of the commercial operation?—Yes, I do say so.

2424. Would you also admit that the temptation to transfer, supposing it possible, is greater now than in the last great naval war of which we have experience?—I could not say.

2425. I make a suggestion to you, that since the Declaration of Paris the advantage of the neutral is very much enhanced. In the great French War the neutral ship was very little safer, if at all, than a belligerent ship. He was equally harried and searched and seized, but since the Declaration of Paris there is a broad line of distinction between the two, and all to the advantage of the neutral?—Yes, I agree.

2426. Without having, of course, changed your view that the scheme is undesirable, you would admit, at any rate, that there is risk of transfer of shipping if the laws of foreign countries allow it?—Yes.

2427. Both a greater possibility of it and a greater risk of it than in any war of which we have had experience in the past?—So long as the Declaration of Paris prevails.

2428. But I gather that, admitting that, you are still of opinion that a national guarantee, such as we have been discussing in this Committee, is not the right way to prevent it?—That is my feeling.

2429. In speaking of the goods just now, you suggested that the war risk would, no doubt, be one of the conditions that would affect their price, but it would be the least of the conditions?—Yes.

2430. Would you say the same as regards the employment of ships by a shipowner in war, that the risks of the war and the charges for insuring against those risks would be much less important in determining what he did with his ships than other considerations. Would they be the principal factor in deciding whether he laid the ship up or not?—The war risk would be the main factor in deciding whether he would employ his vessel or not, because the amount of enhanced freight that he would receive for carrying goods during the period of war risk would determine him whether that employment was desirable or not; so I should think that in the case of his deciding whether his vessel should be employed in a particular venture or not, the rate for war risk would become a very important point indeed.

2431. As regards the supplies of food and raw materials, you said just now, I think, that you thought the war risk premium would be comparatively an unimportant item?—Yes.

2432. What would be the important item?—The state of the produce market for the time.

2433. The equation between supply and demand?—Practically it comes to that, and not only here, but on the foreign markets—on the producing markets.

2434. And you anticipate, I gather, that the natural result of war, or the imminence of war, would be considerable speculation?—I think in the imminence of war there might be probably greater speculation than during the course of the war.

2435. Which would have a very disturbing effect on prices?—It might have a very disturbing effect on prices.

2436. Altogether apart from the actual war risks?—Quite apart from the war risks.

2437. Was there any disturbance of that kind in the markets at the time, for instance, of the Spanish-American war?—No, it never took effect to any extent.

Mr. W. Gow.

30 April 1907.

2438. That, you would say, was because the war was not on a sufficiently large scale?—Yes, and because the class of produce that was affected by the war in Cuba was very small. The only thing one did observe was a very sudden rise in the price of cigars, and in some tobaccos in the United States. In fact, good cigars were unobtainable.

2439. But the area of trade affected by the war was too small to produce any general result?—Too small.

2440. And I suppose the fact that neither belligerent was very much dependent on oversea supplies?—Yes; of course, that was a reason.

2441. You anticipate, I gather, that in the event of the outbreak of a naval war there would be a great demand by Government for freight for Government purposes?—I think so.

2442. And that that would have the general effect of driving up prices of charter-parties and freights all round?—Yes.

2443. That is what happened in the South African war, I think?—Very greatly indeed.

2444. On the consumer, therefore, although there was no real war risk, the effect was just the same?—On the general consumer—the consumer of everything that was brought in by shipping to the country—there was a rise.

2445. One result of that was, of course, to increase the value of ships for the moment?—Yes, and to stimulate building.

2446. The stimulation of building would, in the long run, tend to bring the value of individual ships down again?—Yes, as has been evidenced since the close of the war.

2447. But for the moment the value of individual ships, and, therefore, of the Mercantile Marine as a whole, rose considerably?—The market value, yes, I think so.

2448. Was there any difficulty in covering that increased value by insurance?—I never heard of any.

2449. Do you think it would be equally easy to cover such enormous value if we were engaged in a serious naval war?—Not equally easy, because the amount at stake would be so very much greater. But I do not think that a merchant has ever yet had to go without cover. He had not to do so in the time of the great war, and I do not think that, comparatively, the insurance facilities are less now, when compared with the amount of produce, and tonnage floating, than they were then.

2450. I suppose, generally speaking, the market for war risks is smaller than the market for ordinary marine risks?—I believe so.

2451. It has been suggested to us by some of the witnesses that whilst there is a very free market for war risks for a year ahead in time of peace, the market is very much narrowed the moment the risk becomes imminent or appears imminent, and it has even been suggested by some of the witnesses that if the outbreak of war were followed by a few captures, the market would dry up altogether, and that there would be no possibility of insuring our ships. Do you think that that is a probable forecast?—I think it is probable that some underwriters who had written risks so far ahead that they thought they might run off before a war commenced, might not care to adopt risks when they saw war in the immediate future. But beyond that I do not know that I could say anything definite.

2452. You see that it is a possibility we must consider if there is any basis for this idea, that if the Government will not insure, nobody else will on such a scale?—Yes.

2453. But on the whole you do not fear that?—On the whole, I have not seen any reason to fear that.

2454. You have suggested in the précis that I have before me that the offer of an indemnity would be a great inducement to fraud, or at any rate, an inducement to shipowners and merchants to run undue risks?—Free indemnity, yes.

2455. Would that still be so if we were able so to draw our scheme that the shipowner should only recover the actual value of his ship?—You mean that he could not recover a fancy value?

2456. Yes. It has been suggested to us that, for instance, we should take the value of the ship before war broke out, without the temporary enhancement of the value that might come from its greater earning power in time of war?—I think you would prevent people going in for the recovery of that extra value by such a provision as you suggest.

2457. If the shipowner were limited in that way as to what he would recover, it would be a great inducement to him, would it not, to take all reasonable precautions? In other words, it would always be more profitable to him to complete his voyage than to have his ship seized, and paid for by Government?—I am not sure about that. You might have a ship that was so burdened by debt at the time of the commencement of the war that her loss might be an extremely good sale. You might have a vessel with engagements before her of such an unprofitable kind that they would be sure to leave a loss, which would be wiped out by the loss of the vessel. No doubt the inducement to deliberately get rid of the vessel would be diminished, but you would not clear away that difficulty altogether.

2458. They would be rare cases, would they not?—They would be comparatively rare cases, I believe.

2459. What secures the underwriter against such risks at the present time?—The only thing that secures him is the fact that he would decide very largely whether he cared for the risk or not upon being told what the value that is put on the vessel is. Then he has means of knowing whether vessels are burdened by mortgages or obligations, and sometimes he has means of knowing what employment vessels have ahead.

2460. Habitually, I think, in the marine insurance market, if a risk is underwritten and there is a loss, the underwriter pays on the value insured without question?—Yes, usually; very seldom otherwise.

2461. Would there be any difficulty in ascertaining the real value of the loss if there were such circumstance of suspicion that the underwriter wanted to open the question?—Underwriters feel a difficulty in opening the question of value. They would rather have the fight when the policy is being made than have any question raised regarding the amount of their obligation afterwards.

2462. Speaking generally, when the policy is being made the natural tendency on the part of the underwriters is to put the value up rather than down, is it not?—For some things, but not for others. You must distinguish between the risk of total loss and the risk of what we call average or damage. In the case of total loss a man receives, say, 5 per cent. on the line he takes, say £1,000. It is all the same to him whether that £1,000 is part of £30,000 or £50,000, so long as the £50,000 is not an obviously exaggerated and untrue value. On the other hand, when we come to consider the question of average or damage, if the vessel is valued at £50,000, the man who writes £1,000 pays one-fiftieth; and if the vessel is valued at £30,000 the same underwriter, for the same damage, pays one-thirtieth, so that obviously it is to the advantage of the underwriter to get a real value, not an exaggerated or diminished value.

2463. And, on the whole, the risk of damage being much greater than the risk of total loss, the tendency for him is rather to put the figure up than to pull it down?—To keep it as near what he believes to be the market value as possible. I should not say market value.

2464. How would you define the value?—I do not quite know how to express it.

2465. I will leave it to you when you get the notes of your evidence?—The value based upon the tonnage; I think that is the nearest I can come to.

2466. So much per ton, and the amount per ton being calculated in his mind according to the class of vessel and her age?—Yes.

2467. (*Sir George Murray.*) Except that the exaggerated value tends to make the shipowner rather reckless, the underwriter, I suppose, would prefer the highest value he can get the shipowner to quote?—Until you reach the stage of what we call moral hazard.

2468. (*Chairman.*) Coming back to the State guarantee, your suggestion is that the risky voyages would, on that account, bear the highest freights and bring the largest profits, and that, therefore, if there was an indemnity there would be a temptation to the shipowner always to take the riskiest voyages?—Distinctly so.

2469. But if there were the indemnity, would not

those excessive profits vanish? The profits are high because the risk is great. If there is an indemnity there is no risk to the shipowner?—Perhaps there may be practically no risk to the shipowner, but the shipowner would get paid for it all the same.

2470. But do you think that he could both have the advantage of the guarantee and maintain freights at the high figure?—He could not maintain them at the high figure that might be reached without a guarantee, but they would still be at a high figure compared with peace freights.

2471. Generally speaking, I gather that your opinion is that any scheme of indemnity would be very costly to Government, and would not be efficient for the purposes for which it has been suggested?—I would not like to say it would not be efficient. I should be more inclined to say it would not be so much more efficient than the system now prevailing that it would be worth while for the country to undertake it.

2472. I think you have suggested that if Government is going to interfere at all with the ordinary commercial provision for such cases Government would be better advised to pay in some form a bounty or give an encouragement on those cargoes which do arrive, rather than to indemnify shipowners or merchants for those which are lost?—Yes, that is my personal view, strongly. I ought to say that up till now I have been speaking as representative of the Liverpool Underwriters' Association, and have practically voiced their views. This further suggestion of bounty, or whatever it may be called, is entirely one of my own, with which they are not in any way identified. I believe, in fact, that some of the members disapprove of it. One, at least, does.

2473. May I ask you whether, left to yourself altogether, you would urge the adoption of such a scheme, or whether you only put it before us as less harmful?—No; I would urge it. As an underwriter I would urge it.

2474. What form would you propose that it should take?—The payment of the whole or a proportion of the war premium that has been paid by the parties interested in the venture.

2475. And what object would you expect to attain by a scheme of that kind?—The actual delivery in the country of the foodstuffs and raw materials, instead of the reception by the shipowner or cargo owner of a money indemnity in case of their loss.

2476. Suppose the ship arrives safely, the shipowner, as I think you have already explained to me, will probably have secured high profits, and would be sufficiently rewarded therefore?—Probably.

2477. Equally the merchant would, probably, under those circumstances, secure enhanced profits due to the conditions of which you have spoken?—He would.

2478. Why, then, should we add to those profits by, in such a case as that, repaying to him the insurance which he has already recovered in his enhanced prices, and much more than that?—Only to make assurance doubly sure.

2479. But I think you put to us earlier that the insurance would be the smallest factor really in determining price?—Yes.

2480. If that is so, will not the repayment of the insurance be a very small factor in the mind either of shipowner or merchant?—It would be enough, perhaps, just to turn the balance.

2481. But probably it would be the least part of his expenses in a successful voyage?—Probably, yes.

2482. And probably his profits would amply cover him?—I should think so; yes.

2483. Assuming him to be making a 5 per cent. profit under ordinary circumstances, you would expect the first effect of war to be to raise his profits to 7½ or 10 per cent., and then you would give him a little extra profit in the shape of the repayment of his insurance?—Yes, I would, because I think we need what he only can give us, and that is the introduction into the country of food and raw materials.

2484. That might involve the Government in very heavy expenditure, might it not? Suppose it had no effect upon rates of insurance, still the amount of war insurance on ships and cargoes that would arrive safely would be a considerable sum?—It would be a large sum; yes.

2485. If he was certain that if his ship got in safely Government would repay him the premium, what check would there be on the rise of premium?—There would be the same check that exists now, the check of the market.

Mr. W. Gow.

30 April 1907.

2486. Not quite, would there, because the shipowner or the merchant would not have the same interest in keeping the premium down if in nine cases out of ten the premium was going to be paid by the Government?—If in nine cases out of ten the premium was going to be paid by the Government, there would be 90 per cent. of the vessels arrive.

2487. Yes?—But in that case the war premium would be extremely small.

2488. What I am suggesting to you is that after all the premiums under ordinary circumstances are fixed, as you say, by the competition of the market between the man who wishes to insure and the underwriter to whom he goes, but that if there is a fair chance of the ship arriving the underwriter might say: "Well, you might give me 5s. per cent. more, it does not matter to you; you will recover it from Government"?—I do not know that that would come in, because practically the underwriter is taking the risk of the vessel not arriving.

2489. Might there not be a tendency, human nature being what it is, to put more of the risk on to the war premium, and less on to the marine risk?—I should not have thought so.

2490. I should have thought that that was open to as many possibilities of fraud as a scheme of indemnity?—It had not struck me so, I must say.

2491. And, on the whole, you do not think so now?—No, I do not think so now.

2492. Now I would like, if I may, to ask you some questions about the two draft schemes that we circulated. I understand you are not in favour of those schemes, but assuming that we were to decide to recommend something on the lines of one or the other, you have, I think ,some suggestions to make as to the wording?—Yes, a few points struck me.

2493. First, as regards Scheme A, the person entitled to claim indemnity. Do you suggest any alteration in the wording there?—I suggest, instead of paragraph 1 section (a) in Scheme A, the words "the British owner of or the British or neutral shareholder in any ship registered in the United Kingdom."

2494. Would you tell me the reason for that suggested alteration?—It would leave out of a scheme of British National Guarantee any enemy shareholder, or person interested in a vessel registered in the United Kingdom.

2495. Would there be any possibility of tracing the ownership of a particular ship to that extent?—I believe the ownerships are all entered at the Board of Trade, and the shareholders' list is attached to every vessel there. In the case of vessels owned by limited companies the position is rather different.

2496. That is what I was thinking?—There, of course, the register of shareholders is the only means of tracing it.

2497. Still, the object is to prevent an enemy from deriving benefit?—Exactly.

2498. And you suggest that our words are wide enough (and I think they are) to permit an enemy subject in certain cases to derive benefit?—Yes.

2499. Then as regards the next paragraph, "Losses to be covered by indemnity," I think you wanted to suggest the introduction of some further words there?—Yes. Before the words "capture or seizure," with which that paragraph commences, I think it would be wise to introduce the words "Loss or damage proximately caused by capture, seizure, detention, etc."

2500. Would you explain to me again your reason for that suggestion?—In English assurances, according to the decisions of the English Courts that have been upheld for 150 years anyhow, the underwriter is only liable for losses immediately caused, proximately caused, by the perils against which he insures. He is not liable for the more distant results of those causes. Consequently, in the case of writing a war risk, where we write against capture, seizure, etc., we only pay for the actual damage suffered by the vessel, or the actual loss sustained by the owner, through the capture, seizure, or damage of his vessel. We do not pay for any secondary result of that. For instance, in the case of produce we pay for loss of produce, but we do not pay for loss of market, we do not pay for any loss of time bargain, supposing stuff is sold for delivery at a certain date and is not delivered till after

Mr. W. Gow. 30 April 1907.

that date. Now in some Continental countries, notably France, the words in which the risk of war is expressed in the French policy are so very wide that underwriters have actually been held to be liable for all those subsidiary secondary losses, which in many cases are extremely severe. I happen to know that practically, because in some risks that my company wrote in a French agency during the Spanish-American war, the Bordeaux agency, I think it was, we were held liable for loss of market and loss of profit on cargoes which had been captured, in addition to being held liable for the loss of the goods themselves. It is to prevent any undue extention of national indemnity or of any indemnity that I suggest those additions.

2501. (*Mr. Beauchamp.*) Is not that covered by the clause suggested: "As ordinarily covered by an English policy"?—Yes, but I did not know whether "as ordinarily covered by an English policy" referred only to the latter part or to the commencement. It was not quite clear how far it stretched back, so I thought it better to put the words at the very commencement, to cover the whole paragraph.

2502. (*Chairman.*) You noticed, of course, Section 4 of the Scheme, where the values are more particularly defined?—Yes.

2503. The wording there, "the value of the cargo at the port of shipment plus insurance and freight to port of destination," would exclude such secondary loss?—Yes, it would, under that section, but I thought it was better to make it clear from the beginning.

2504. Have you any further suggestion in regard to that paragraph 2 before we leave it?—Yes; referring to the words "being prevented by such instructions from reaching the country of destination," I think one or two words ought to be added to exclude enemy ports from permitted destinations. I suggest the words "British, Colonial, or neutral destination."

2505. Would not that be covered by the proclamation ordinarily issued at the outbreak of a war prohibiting the King's subjects from giving aid or comfort to the enemy?—Yes, I believe it would; but at the same time one might again make it quite clear in this document by itself.

2506. Section 3 I need not ask you about, I think. Now to come to values, do you consider the value of the ship at the time of capture a satisfactory value to take?—No, I do not.

2507. Why not?—Before capture the vessel might be damaged by sea perils, or might be damaged by some non-fatal war peril. On the other hand the value of the vessel and her cargo might be enhanced by the loss of other vessels and cargoes occurring after the sailing of the first vessel but before her capture. It seems to me that one would require to take the value at some definite period, either the commencement of the voyage or the close of the voyage. At the close of the voyage, if it were a successful voyage, the acceptance of that value would be open to the same difficulty as regards enhancement or fall by capture or safety of intermediate ventures, so that it seems to me the true value to take is the value at the start of the venture. It has suggested itself to me, as we have lately been going through a Marine Insurance Bill, which has been made an Act in the last Session, that the proper insured value to take is the insured value of that ship as defined by that Act. Perhaps I might give you a copy of the wording?

2508. That is the Act of 1906. Perhaps you would just read that extract to the Committee?—"In insurance on ship, the insurable value is the value, at the commencement of the risk, of the ship, including her outfit, provisions and stores for the officers and crew, money advanced for seamen's wages, and other disbursements (if any) incurred to make the ship fit for the voyage or adventure contemplated by the policy, plus the charges of insurance upon the whole. The insurable value, in the case of a steamship, includes also the machinery, boilers, and coals and engine stores, if owned by the assured, and in the case of a ship engaged in a special trade, the ordinary fittings requisite for that trade."

2509. I am afraid I am ignorant of the Act of last year. For what purpose was the value of the ship defined in that Act?—To fix the value in case no value was agreed in the policy. The statutory value of the ship is the value described unless otherwise stated.

2510. Then the Act of 1906 contemplated cases where no value would have been stated in the policy before the ship was lost?—Exactly so.

2511. And it then defined the value in that way, to be ascertained after the loss had taken place?—Yes, to be the value at the commencement of the voyage.

2512. Would there be any difficulty among underwriters and shipowners, parties interested, in arriving at the value in such a case under that clause?—It would cause considerable difficulty. The fact remains that, in I should think 999 cases out of a thousand, both the shipowner and the writer prefer to have the value agreed and put in the policy at the commencement.

2513. Then each of them knows his risk exactly?—Yes. This wording shows the items that are covered, but does not define the value. If we say a steamer, we understand that the word "steamer" covers all the items that are specified in this paragraph of the Act.

2514. Then turning to sub-section (*b*) we have suggested there that the value of the cargo should be taken as the value at the port of shipment, plus insurance and freight to the port of destination. That is on page 6 of the white print?—Yes. I think the difficulty there lies in the words "plus insurance." I suggest that that might be made clearer by saying "plus ordinary free of capture and seizure insurance," (what you might call peace insurance) "and freight to port of destination so far as prepaid." It might be that there was no freight prepaid, and it was all paid at the port of destination, so that in that case it should not be included in the value of the cargo. Supposing it is bought at the port of Antwerp, you pay an Antwerp price for it. If you pay the freight on loading the cargo, before the ship sails, that value is put into the cargo's value; there is no freight at risk. On the other hand, suppose your freight is payable at destination in the United Kingdom, say Bristol or London, the amount of value that is exposed to loss is the Antwerp cost plus a fair profit, brokerage, or what ever it may be, but excluding the value of the freight, which never is at the cargo owner's risk at all until it is delivered.

2515. And in such a case the cargo owner would be under no liability to the shipowner?—Not till the latter delivers.

2516. That raises the question whether in such a case the shipowner ought not to be indemnified for the loss of freight. You point out that the cargo owner will not have paid the freight, and therefore there is no cause to indemnify him?—Yes. Then the shipowner would insure with Government, or with an underwriter, or get indemnity for the amount of freight that was not prepaid, that was at his risk during the venture.

2517. Yes, it is not that we have included a risk that we ought not to have included, but we have given the advantage of the indemnity to the wrong person?—Yes. That depends on the contract of affreightment. It depends on the arrangement made for the place of payment.

2518. As regards the note to that clause have you any observations to make?—Yes. I should like to take the word "only" out after the word "shipowner," in line five, and I should like to add the words "charterer or person controlling the vessel, also the shipmaster, or other officer in charge." My reason for that is that one can conceive that instructions might not be conveyed through the shipowner at all. They might be conveyed to the shipowner, who might have no means of enforcing them upon his charterer, unless he makes arrangements in his charter to have that power of enforcement.

2519. What is the general policy in the insurance world as regards the treatment of a third party, an innocent party, if he is damnified?—He is generally very well treated, almost too well treated. The result is that in some cases we get third parties who look innocent, but cannot be considered entirely innocent, and for the sake of our own credit we pay them, when we feel that we are really robbing ourselves.

2520. It might be desirable then that in a Government scheme, especially if there were free indemnity, we should be a little less generous?—I think it would be most absolutely necessary.

2521. (*Sir George Murray.*) I should like to ask you what you think the probable effect of a free indemnity would be on prices generally, including the freight prices themselves and insurance?—Do you mean ordinary insurance?

2522. No, war risk insurance. Do you think it would tend to keep them down, or what would its effect be?—If free indemnity were offered, there would certainly

be a great rush for employment of shipping, and in that way it is possible there might be a certain amount of what one might call artificial competition created.

2523. Would you call it artificial competition?—Real competition artificially created, I ought to have said.

2524. That would *pro tanto* neutralise the effect of the Declaration of Paris, would it not?—It might to some extent.

2525. Do you not think it would have that effect entirely?—I have not considered that point. I should not like to make a statement very definitely on that.

2526. But you do not think it would materially prevent a panic rise of prices?—Let me understand. When you speak of prices, do you mean prices of produce, or prices of insurance?

2527. Would not the price of the produce include the price of the insurance? I mean, can you consider the two apart from each other?—The price of the produce ought certainly to bear the additional insurance.

2528. Therefore the price of the produce will include any enhanced value due to a rise in insurance?—Might I put it this way, that the man who wants to sell the produce will try to get in his price the full extra insurance? He might not, for market reasons, be able to obtain that price, but his object would be to get it, of course.

2529. Would not a free indemnity have the effect of keeping down that ultimate price. Would it not, in other words, reduce that element in the price which is due to increased insurance?—Yes, if you keep it from operating in any other way on the market it would have that effect. What I mean is this. A free indemnity might be so costly as to cause a general rise of expenses throughout the country, and in that case, there would be an addition to the prices from that cause alone, so that that itself might to a certain extent countervail the apparent advantage got from the free indemnity.

2530. Yes, but apart from any effect of the free indemnity in raising taxation, would it not have the effect of keeping down prices by eliminating the increased cost of insurance?—I think it might, to some extent.

2531. (*Sir George Clarke.*) The bonus that you propose is to apply to cargoes and ships, both?—Yes.

2532. And the effect of the bounty on arrival would be to increase the inducement to run the ships?—It seems to me so.

2533. I think you have told the Chairman that you do not think the inducements already existing would be sufficient without that?—I think this would be a considerable additional inducement, if I might put it so.

2534. Therefore the present stimulus is not quite sufficient. Another effect of your bonus system would be to check fraud?—I think so.

2535. But is it not rather expensive to give a bonus to 99 honest people in order to induce the one dishonest man to be honest?—If that were the sole object of inventing the bounty, it might be cheaper to let the dishonest man be dishonest.

2536. Would not the general effect of the bonus be simply to increase the value of cargoes of ships on arrival?—To increase the value of the arrived ones, yes.

2537. So that, probably, the bonus would be insured like any other part of the value of the ship?—It might be.

2538. A system of that kind might very well arise?—It might, unless it were made illegal.

2539. I think you said that the great rise of prices which one must expect in war would be due to the state of the produce market, but that would depend upon the nature of the war and of the produce, would it not?—Certainly.

2540. If the countries which supply us with food and raw materials generally were not involved internally in operations of war, and if their production was going on unchecked, would great rises occur on that account?—So much of our produce has to come by sea that you would always be liable to have that attacked.

2541. I am talking of the production; the production would be the same?—The production would be the same.

2542. If America was not at war, for example, her production would be unchecked?—Her production would be unchecked.

2543. And if Argentina were not at war her production would be unchecked?—Yes.

2544. So that it would not be the production market but the sea risks which would raise the prices?—Except that in the production market you would almost certainly have an artificial stimulus given by the fact of our being in necessity.

2545. Yes, the measure of the need would be the measure of the price. I think you said that facilities for insurance are as great now as they were at the time of the French Wars, but, of course, the stake at sea has enormously increased, not only in value, but in the numbers of the shipping?—Yes.

2546. (*Chairman.*) May I interrupt? I think what the witness said was that they were as great now in proportion?—I said I thought the comparative facilities now were as great as in the time of the war.

2547. (*Sir George Clarke.*) In proportion?—Yes.

2548. In your paper you have raised certain objections in principle to Scheme B?—Is that the purchased indemnity?

2549. That is the purchased indemnity scheme. I do not know whether you quite understand the nature of that scheme. The idea is that there should be fixed rates, fixed, of course, before the war, and lasting during the war, not to be raised under any circumstances, but giving to the Government power to say that they should not hold on particular routes, if necessary?—No, I was not aware of that.

2550. That is the general nature of the scheme. The objection that you raise is, I think, that it is proposed to postpone the levying of premiums till the cost of the risk is known. Of course, that would be impracticable; but I suppose one of the essential features of insurance is that it should be paid on the nail?—Yes, the premium paid on the nail. In England it is. It is not in France. In France premiums on hulls on time are paid 11 months after the risk commences.

2551. But I suppose in any system of war insurance prompt payment would be an absolutely essential feature?—That is the essential feature.

2552. Then what is the other objection on principle that you raise. I think one is that you think the State would get the bad risks?—That is in connection with the suggestion of Mr. Wilding. I do not know if you recollect his evidence before the Royal Commission on Food Supply. He suggested that risks up to 5 per cent. (I suppose he means 5 per cent. per voyage, and not per annum) ought to be allowed to be done in the ordinary way with underwriters, or with marine insurance companies, but that any risks that were rated above that premium ought to be placed with the State, or rather that the State ought to take charge of them. It seems to us, or to some of us, who are in the underwriting business, that the sole effect of that would be that the ordinary underwriter would get all the good risks, the 2s. 6d., 5s., 7s. 6d., one guinea, and two guinea risks, on which the risk is comparatively small and the return is fairly safe, and that the State, having lost all those, would undertake all the really perilous risks.

2553. Would there be many half-crown risks at the outset of a war in which British commerce was exposed or thought to be exposed all over the world?—There might be, and there might be very valuable half-crown risks. For instance, the movement of bonds and specie at present from London to Paris, from London to Bremen, from Trieste to Alexandria, from Alexandria to Bombay, from Alexandria home—all these risks are, for sea as well as war, covered at present at half a crown, and it seems to me that a good many of those risks would still go on, for, anyhow, a short time, at the commencement of a war, without being interrupted, and they would be rated at a low rate. There would probably be immense shipments of one kind and another at the commencement of a war.

2554. Then in stating your opinion were you thinking of a fixed rate, or were you thinking of the State setting up a great insurance office, and managing it on underwriters' principles?—It seemed to me that it was impossible to contemplate the State fixing a premium at the commencement of war, the progress of which and the course of which was doubtful. It seemed to me impossible that they would start with the idea of a fixed rate. That rate might either be grossly inadequate for the risks that were run or else it might turn out to be grossly exaggerated. In one case the State would

Mr. W. Gow, 30 April 1907.

be greatly underpaid for the risks it was running, in the other case the State would be overcharging for it.

2555. But supposing the calculation was based on something like an average derived from the last period of a great war, that there would be within a year such and such a percentage of captures, and it was based on something of that kind; then if that proportion of captures was not largely exceeded the State would know pretty well where it was?—But could any such comparison be drawn? Is it possible to draw any real conclusion from two states of affairs which are so entirely different? The growth of steam power, the change of the method of propulsion, the independence of most tonnage from wind and wave, one might say the opening up of new routes in consequence of being able to proceed in directions that were formerly forbidden by certain winds, everything of that kind seems to me to prove that there is no possible comparison between what would happen in the case of a war now and what happened in the case of war at the beginning of last century.

2556. That may be, but still the principle on which a scientific rate would be fixed would be what we cannot have, a purview of the war as a whole. The rate which an underwriter fixes from day to day, when he gets a telegram of a loss in some particular part of the world, and up go the rates, cannot be scientific, and therefore would not the scientific principle, if it could be had, if we had knowledge enough, be the principle of a fixed rate lasting throughout the war?—I do not like to suggest it, but if I may might I suggest that the assumption is fatal.

2557. Why fatal? In the worst cases the State has to pay rather heavily, but if the State has accomplished a great object it may be worth doing it. In the other case the State gets a little too much, that is all. It does not seem to me to merit the word "fatal" quite?—But does the State accomplish the object by paying the losses, or does it accomplish the object by getting the ventures completed?

2558. The sole object is that, and, as the State lets all the cargo owners and the merchants know the cheapest rate at which they can get their insurance, they do not find their businesses so much disturbed as when they go to their offices one morning and find that rates have gone up to 30 guineas which were small the day before?—Yes; there is the advantage of fixity undoubtedly.

2559. And do you not think that the violent fluctuations which must occur would be a very serious check on the operations of commerce?—I think the operations of commerce would be more seriously checked during the few weeks before the outbreak of war than on the actual outbreak of war. I think the markets would be restrained, very close indeed, for, say, ten days before the outbreak of war, and after the outbreak of war people would begin to think of businesss again.

2560. Then if a scheme of this kind is to be devised, of course that scheme could be operative always?—You could make it retrospective.

2561. Of course, nobody would take it in times of perfect peace, because the ordinary rates would be much lower, but it would be there, and available. Do you not think that might possibly be a gain?—It might, but it seems to me, unless I am quite wrong in my ideas of what the rates would be, that the cost might be very great.

2562. Of course, it could not be so great as in Scheme A, or nearly so great, because there must be a substantial return?—Certainly it is more economical than Scheme A.

2563. Yes, it must be more economical than Scheme A, and in the long run, especially if, after the first few weeks of war, the Navy did all that we expected of them, it might be economical?—There might even be a profit on it.

2564. It is fair to say, is it not, that the impressions derived by the underwriter and the rates he fixes must be determined a good deal by a consideration of his own personal point of view?—Probably of the business he has actually been doing.

2565. His own small circle of business?—Yes.

2566. That is to say, if he has had a heavy loss at any time, the tendency would be for him in the future to keep rates as high as he could, in order to cover that loss?—Yes, I think so.

2567. Therefore rates are not necessarily fixed in accordance with the risk at the moment?—Let me put it in this way. An underwriter who has made a loss in a particular direction will probably ask a higher price than a man who has not had that loss, but he may lose the risk altogether.

2568. The man who has not burnt his fingers may come in and under-cut him?—If you put it that way.

2569. But if there had been considerable losses in the first few weeks of war, spread over a good many underwriters, their tendency for the rest of the war would be to keep rates as high as possible to cover that risk?—Yes, I think so; to keep rates as high as possible.

2570. But the State, not having that object, would not do that?—The State, having an unlimited purse, could do what the underwriters could not do.

2571. Not being frightened by initial losses?—Certainly.

2572. (*Chairman.*) Do you agree with the question put to you, that that would be more scientific?—No, I cannot agree that it would be more scientific.

2573. (*Sir George Clarke.*) Then may I take it that you think if a scheme such as B could be devised it would at least have a steadying influence?—I think if a scheme like B could be devised and properly worked it might have a steadying influence.

2574. Do you think a steadying influence may be required in the State in time of war?—I have not been through a home war. I cannot tell you.

2575. No, I am afraid we are all guessing. But it is possible that there would be a panic before war broke out?—I think before war breaks out is the dangerous time, so far as I have been able to see.

2576. You do not see any fundamental objection to scheme B; your objection is that the State might lose a good deal or that it might gain a good deal. You do not see any objection on principle?—I confess I cannot get over the difficulty which I may call the unfairness of making a fixed rate over the whole campaign or a whole year.

2577. Yes, but you have admitted, have you not, that if one had an idea of what the total loss would be it would not be unfair; it would be the most scientific thing that could be conceived?—That is what I think I meant when I said I thought the assumption was fatal.

2578. But your main objection is that you think the State might lose too much?—I think the State would certainly lose. The other objections would be objections to the practical working.

2579. And do you think it would be quite impossible to work practically?—Many of my colleagues think so.

2580. Do they quite understand what is meant?—I think they understand what is meant.

2581. Supposing you had a fixed schedule of rates, so much per cent. in such a zone, and so much per cent. in another zone, and that was all printed on forms, and the forms were handed out to certain insurance firms to act as agents on commission, where would the practical difficulty arise?—That is an introduction of a new point as far as I am concerned. That is a point of which I was unaware—handing out schedules to firms to act as agents for the Government.

2582. Do you see any grave practical difficulty in that?—It would not be so difficult as to work it under a Government Department.

2583. Of course, we are aware of the difficulty of getting an accurate estimate of values, but some witnesses have told us that that might be got over, and that we might perhaps take, for the purposes of the purchased indemnity of the Government, the values which have been taken for the marine risk?—I should like to draw your attention to the evidence of one of the witnesses in the Food Supply Commisssion, who said once that if those values were going to be taken as fixing him for the value for insurance against war, then his £30,000 steamer would be insured for £50,000 against ordinary risks.

2584. You do think that that is an objection to any form of Scheme B, that the State would be in a difficulty in arriving at the value?—I think it is a great difficulty.

2585. You do not think any system could be devised by which values could be estimated?—I think it would be extremely difficult.

2586. I suppose the value of steamers is pretty well known?—Yes. Of course the building price is usually ascertainable, and one can allow for depreciation, and allow for rise or fall of value owing to increase or diminution of the value of tonnage in the meanwhile, the ordinary value apart from depreciation.

2587. And the value of cargoes can be estimated fairly?—That can be easily estimated.

2588. So that it might be possible to arrive at the value?—There is no absolute impossibility about it.

2589. (*Mr. Beauchamp.*) You think that the value of produce in time of war would be determined by other considerations than the question of war insurance?—Yes.

2590. By the question of supply and demand?—From the best information I have been able to get I have been convinced that the rate of war premium would be only a small factor in determining the value.

2591. But the price of commodities, from a commercial point of view, would rise both for the belligerent and the neutral, would they not? Each would have to pay the same price; that is to say, that Spain would have to pay the same price for cotton at Barcelona as Liverpool would for the cotton itself, apart from the war insurance?—You mean that the seller in America would take the same price from a buyer on Spanish account as he would from a buyer on English account?

2592. Yes?—Yes, I do not see why he should not.

2593. But the English merchant would have to pay a higher price for his cotton, by the amount of war premiums that he had to pay, than the Spanish buyer would?—Yes.

2594. Therefore we should be at a disadvantage?—We should be at a disadvantage in that respect.

2595. Therefore it would be advisable to keep down, as far as we possibly could, the war premium?—Yes.

2596. Do you think that the premium at the outbreak of war, or before the outbreak of war, would be considerable on most voyages?—That would, of course, depend, to a certain extent, upon the Power with which the war was being waged, and on the disposition of the naval forces of that Power at the time.

2597. Yes. Assume that we were going to war with a first-class naval Power?—If we were at war with a first-class naval Power, with a certain amount of strength in the North Atlantic, the outbreak of a war would certainly cause a war premium of some extent to be levied.

2598. And do you think that the war insurance market would be sufficient to cover a ship and cargo of a large value?—I should say an ordinary ship and cargo ought to be easily enough absorbed.

2599. How much do you think the ordinary market would absorb? Do you think there would be a war insurance market, say, for instance, to the extent of the loss of the Dakota, £750,000?—A swift liner, about a five-day boat across the Atlantic, I should say, or five and a-half days?

2600. Do you think the market would be large enough to cover that?—I think it might.

2601. At the outbreak of war, before any capture?—Yes.

2602. But, suppose two or three captures occurred in one or two days, and were placed on the loss book, do you then think you would be able to cover three-quarters of a million?—It might be more difficult.

2603. At any rate, the premium would go up very considerably?—The premium would go up.

2604. And as the premium went up the market would become smaller, would it not?—I am not sure about that. It might bring out more writers.

2605. Do you think you would get as many writers for the 15-guinea risk as you would for the 2 guinea?—No, but I do not anticipate it would be a 2-guinea risk to begin with.

2606. Do you think the premium would be greater than 2 guineas at the outbreak of war?—I imagine that if a North Atlantic war were imminent, a war with a first-rate Power, we might have a 5-guinea rate. I think there is more chance of the risk being pitched high now than some time ago. If they started high I think they might work back.

2607. If there were no captures?—If there were no captures; just as in overdues. We have noticed of late years that instead of the rate commencing at 2 and 3 guineas you jump up to 5 or 7 at once, and then you sometimes fall back next day.

2608. But it is rather anticipated that there would be a considerable number of captures in the early weeks of war?—I have always thought the early weeks of war would be the serious time.

2609. And, therefore, in the early weeks of war the war insurance market might be contracted?—It might be contracted, yes. Of course, £750,000 is a big figure. but there are many grain cargoes and cotton cargoes from Canada and the States (Montreal, St. John, N.B., New Orleans, Baltimore, and Philadelphia) that do not reach to that figure, so that the market would not be contracted on their account.

2610. Supposing there had been several captures taking place within the early weeks of a war, what do you think would be the extent of the war insurance market?—Thirty guineas.

2611. I do not mean the premium, but the amount that the market would cover?—After captures?

2612. Yes?—A quarter of a million.

2613. In answer to Sir George Clarke you said that the adoption of a scheme such as B would have a steadying influence. That would be the same with Scheme A as well, would it not? Both Scheme A and Scheme B would have the same effect as a steadying influence?—There would be the same security, but I think Scheme A would involve such an amount of looking after the shipowner and cargo-owner (in fact, looking after the venture), that the shipowner and cargo-owner would be more hampered in their operations, and would find themselves in a more difficult position than under Scheme B.

2614. Why is that?—Because I think that when people have to pay for a thing they take more care of it than when they get it for nothing.

2615. You said they would be more hampered under Scheme A than under Scheme B?—Yes.

2616. They are not going to pay anything under Scheme A?—No; the result is that the Government has to protect itself by laying restrictions upon them.

2617. But they would both have the same effect as steadying influences?—Because they give an excellent security.

2618. Then with regard to the practical working out of any scheme, such as B, do you think it would be practicable, even under the scheme suggested to you by Sir George Clarke, of the underwriters being authorised to act as agents for the Government, to adopt such a scheme after the outbreak of a war?—I think it would be very difficult, I must say. Very difficult indeed, I should say.

2619. And if it were not done in that way, if the underwriters were not to act as agents, do you think it possible to form a Government Department to carry on the war insurance after the outbreak of war?—If the thing is to be done at all it has got to be done in time of perfect peace. An expensive department has to be formed and kept up, we hope for many years before it is needed at all, and it must be just as ready to undertake its operations on the threat of war as our Navy is.

2620. (*Sir George Clarke.*) What would this large establishment be doing?—Keeping its eyes open.

2621. (*Mr. Beauchamp.*) I think you mean you could not improvise it after the outbreak of war; you must have everything ready?—You must have everything ready.

2622. (*Sir George Clarke.*) But the counsel of perfection would be that the scheme should be in operation to-day, only that it would not come into being because the prices would be too high, but that at any moment a man can take a State premium if he thinks the war clouds are looking black?—It is a very large order.

2623. (*Mr. Beauchamp.*) The staff would have to be formed in peace time?—I think so.

2624. That staff could not be very greatly enlarged

Mr. W. Gow. 30 April 1907.

after the outbreak of war?—You would add to the dangers of carrying out the scheme if you were to seriously add to your staff afterwards, or to look for your capable men afterwards. I should say, if you will allow me, that many of my colleagues are strongly of the opinion that any scheme of the kind would almost necessarily fail; but I cannot say I feel that quite so strongly as most of them do.

2625. (*Chairman.*) By your colleagues you mean the members of the Liverpool Underwriters' Association?—Yes, but I do not regard the Government as incompetent to do business, in the way that has sometimes been suggested.

2626. (*Mr. Beauchamp.*) But they could not start after the war had broken out, could they?—Not straight afterwards. They must prepare beforehand.

2627. And no difficulties of that kind would occur under Scheme A, because under Scheme A there would be no policy of insurance taken out, but only payment to be made if a loss was sustained?—But surely you do not allow a man to undertake any venture he likes under Scheme A, and to say he is covered by the Government?

2628-9. He would automatically come in at the outbreak of war. The Government could afterwards say that certain voyages would not be accepted?—That seems to me a very, very wide cover to grant, one that would be a costly cover for the Government in the end, I think.

2630. They would only pay for those that were lost. Under your scheme, apparently, they are to pay for everything which arrives?—Yes, a bounty.

2631. Therefore, the fewer the captures made, the greater would be the loss to the country?—The greater would be the cost to the country the fewer the captures made, undoubtedly, on that account. On the other hand, every arrival would knock down the premium, so that when you take the two together the probability is you would come out quite as cheap in one way as in the other.

2632. (*Sir Thomas Glen-Coats.*) Do you think, in the case of a war with this country, the prices of food stuffs and raw materials—you mentioned cotton just now—would probably fall in the countries of production? My reason for asking that is, the owners of the food stuffs and raw materials, if they could not sell their productions, would require to provide storage in these countries. Do you think the prices of food stuffs and raw materials in the countries of production would fall?—I should say that if the producers suddenly discovered that one or two great markets were closed to their operations, closed for their sales, they might not value so highly the stocks that were left in their hands.

2633-4. I was thinking of this country. Of course, this market for food and grain stuffs is the largest foreign market the countries of production have?—Yes.

2635. Therefore, I wondered whether the fall in the countries of production would not make up to a certain extent for the extra cost of freight and insurance, and therefore help to keep the price of food stuffs and raw materials down in this country. Of course, if the cost of cotton rose very high there would be less cotton consumed in this country, as we could not compete with foreign manufacturers; also, with regard to food stuffs, there would be less consumed if they rose to a very high price. It occurred to me that prices in the countries of production would necessarily fall?—I should not have thought so. At least, I do not know of any case in which that has happened. For instance, I do not know, in the case of any country that we get cotton from, that the occurrence of a war has raised those prices or diminished those prices seriously.

2636. No, but this country has not had any war during the time it required to take such large quantities of cotton from the United States?—I should not have thought that the effect would have been to diminish those prices, but the question is one entirely new to me. I could not answer definitely offhand. I think myself it would not operate in that way.

2637. (*Chairman.*) Assume, for a moment, that our markets were closed; that might diminish the prices in America, for instance, for cotton or corn, in consequence of the loss of so vast a market as ours?—Yes.

2638. That being so, the foreign countries would, I suppose, obtain their cotton and corn cheaper, if they bought any?—Yes, they might.

2639. But, *ex hypothesi*, cotton and corn would be at famine prices here, would they not?—I think so.

2640. Because the fall in America would be due to their being unable to get any of their stuff into this market?—Solely.

2641. So that other countries would benefit by the fall, but we should be suffering from famine prices?—Of course, other countries might at the same time find it advisable to absorb as much of the crop as they could get. It is quite possible that the German spinning districts, the French spinning districts, and the Swiss spinning districts, might take up a great deal more cotton than they are taking now.

2642. (*Sir Thomas Glen-Coats.*) Following that up, they could only use up the amount of cotton that they had machinery to manufacture. They would have to store it?—Well, there are such things as driving mills overtime, doubling staffs, and doing things of that kind. I think, perhaps, the point you have suggested holds more in the case of raw materials. The food might be cheaper for our rivals in consequence of our going out of the market.

2643. (*Captain Ottley.*) With regard to the possibility of transfers to a neutral flag, you mentioned in reply to Mr. Beauchamp just now that there was a possibility after certain captures had taken place that the war premiums payable by British ships, supposing Britain were a belligerent, might rise even as high as 30 per cent. Such war premiums paid by the shipowners would, one would suppose, be recouped to them in increased charge for freights, and, of course, that would mean ultimately that the consumer and the shipper would have to pay those prices if the merchant shipped in a belligerent vessel. That is so, is it not?—Yes.

2644. Then the war premiums paid by neutrals would be less. You can hardly imagine, for instance, that a ship full of iron ore from Bilbao, if she flew a neutral flag, would be liable to pay such a heavy war premium as if she flew the British flag?—Do you mean a cargo on British account in a neutral bottom?

2645. Yes?—That would be protected at present under the Declaration of Paris.

2646. Hence neutrals would be able to take cargoes at a lower freight?—Yes.

2647. In such a case, if there were two ships, a British ship and a Spanish ship, lying in Bilbao Harbour, both of them anxious to get a cargo, there can be no doubt which would get the cargo?—There can be no doubt which could afford to offer the lower freight.

2648. And do you not think also there would be no doubt as to which would get the cargo?—In ordinary circumstances, yes, unless there were something very exceptional.

2649. So that, logically, it seems that any increased war premium paid by a belligerent over the war premium paid by a neutral is tantamount to a bounty which the neutral has got?—Yes, practically.

2650. And of course the larger the difference of war premium the greater the burden?—Yes.

2651. One of the objects of our scheme is, as far as possible, to keep the trade in the British ship. Then there was one small point as to the very interesting evidence you gave us with regard to the transfer of British shipping to a neutral flag. Do you not think that the facilities for such transfers are enormously greater than they were 100 years ago, by reason of the rapid communication by steam and the electric telegraph. A shipowner in England, seeing that war premiums are going up very rapidly, cables over the Atlantic to some great capitalist combination on the other side, assuming America is a neutral, and the bargain is fixed that day, or at least it is fixed very rapidly. Is that possible?—At present in the case of America it is not possible. The law of the Union is against it.

2652. Can we take a case of a country in which it would be possible, for instance, some other neutral country, such as France?—My recollection of French law is that it would not be permissible there.

2653. My point is that as compared with the state of things a hundred years ago all those little difficulties are immensely smoothed away by the power of rapid

intercommunication?—All difficulties other than the legal, yes; but I think the real difficulties are the legal ones, so far.

2654. I do not want in the least to underrate them. The difficulties are enormous from the legal point of view. But from the point of view of the mere apparent transfer the fact of their being able to get across the Atlantic, so to speak, in the twinkling of an eye, instead of taking a month to do it, as we did a hundred years ago, I should have thought made it easier to arrange those transfers?—I do not know that it makes it easier, but it makes it more rapid. I mean one can decide, perhaps, in 24 hours what one would in the old days require, perhaps, four months to settle. Will you allow me one word?

2655. (*Chairman.*) If you please?—Captain Ottley suggested to me a very interesting thing just now when he spoke of the bounty conferred on the foreign neutral by the height of the war premium on British vessels. Would not that bounty be very largely discounted, at least in cases of useful cargo, by the adoption of the bounty system that I have suggested here, the return of the war premium to the shipowner, and the shipper of cargo or the owner of cargo, in the case of successful ventures.

2656. (*Sir George Clarke.*) Then you would not confer your bounty upon neutral ships,, even if they brought in very valuable cargo to us?—No. My idea was it was a national indemnity, to be confined to things that are national.

2657. (*Chairman.*) You recognise a certain danger to the nation of losing this shipping in time of war?— Frankly, yes.

Mr. W. Gow
30 April 1907.

2658. And personally you are anxious to find some further protection than we yet have?—Certainly. I do not think that any system of indemnity or any payment of cash will ever make up to this nation for the want of the food on which we live, or the want of the raw materials which we have to work up; so that anything that brings about the delivery in this country of those things is worth encouraging by every means in our power.

2659. But in the suggestion you just made to me, which was very pertinent, you were thinking not of the cargoes, but of the ships for the moment?—I was thinking of the ships for the moment, but the two go so much together that it is difficult at times to express them separately.

2660. I quite agree. At the same time, we have to try to keep them separate in our minds, because, as you see in regard to this particular matter, they lead to different conclusions. If you are thinking of keeping the price of food low, you might repay the insurance on the successful cargo of food, whether it came in a neutral bottom or in one of our own ships?—Yes.

2661. If you are thinking, as at the moment you were, of the ship, you then confine it to the British shipowner?—The British shipowner alone. If the cargo of a British owner comes in a neutral bottom, I think that cargo is entitled also to the rebate, but I do not know that the owner of a foreign neutral vessel carrying a cargo is.

THIRTEENTH DAY.

Tuesday, 7th May 1907.

PRESENT:

The Right Hon. Austen Chamberlain, M.P. (*Chairman*).

Sir Thomas Glen-Coats, Bart., M.P.
Sir George Sydenham Clarke, G.C.M.G.
Sir George H. Murray, K.C.B.
Captain C. L. Ottley, R.N., M.V.O.
Mr. Edward Beauchamp, M.P.
Mr. Henry Neville Gladstone.
Mr. Arthur Lindley.
Mr. George H. Duckworth (*Secretary*).

Mr. Frederic Bolton, called and examined.

Mr. F. Bolton.
7 May, 1907.

Mr. Bolton, in a preliminary memorandum,* had submitted:—

(1) That a scheme of national indemnity is desirable in the interests of the nation, and that in time of war some such scheme of protection, whether desirable or not, will be forced upon the Government of the day.

(2) That the advantages to be derived from such a scheme are:—

(*a*) Relief of Government from popular pressure;

(*b*) Steadier prices;

(*c*) Continuity in the supply of food stuffs and raw materials;

(*d*) Better distribution of the cost of war losses;

(*e*) Continued employment of the mercantile marine;

(*f*) Prevention of discrimination in favour of neutrals;

(*g*) Removal of temptation to transfer to a neutral flag.

(3) That Scheme "A" is preferable to Scheme "B," and might be developed upon the lines suggested. (See Appendix.)

(4) That payments for direct losses under a full scheme of indemnity may be estimated at £10,500,000. (See Appendix for details of calculation.)

2662. (*Chairman.*) You are an underwriter and broker, I think?—I am.

2663. And a shipowner?—Yes.

2664. You have been good enough to send us a printed memorandum of your evidence, and I think we may take it that the Committee have read that, and I propose therefore to print that as an Appendix. The questions I put to you will only be to elucidate matters in connection with it. I will follow the order of your paper. In regard to the suggestion you make for altering the definition of the persons entitled to claim indemnity, what is the object of your wider words?—As far as regards the ships, I think it would be a wiser plan to make the scheme Imperial. As far as regards the cargo, in order to secure the objects that I have named, it would be necessary to give the guarantee for the cargo shipped, and not only for the cargo liable to capture.

2665. But your words might include, might they not,

* *Vide* note, page iii.

Mr. F. Bolton.

7 May, 1907.

foreign goods, and even enemy goods?—Certainly. Of course, the enemy goods, I take it, could not be legally insured under the common law if proved to be enemy goods. It is intended to cover foreign-owned goods. I think the difference is so small, and the difficulty would be so great if the protection were limited simply to British-owned cargo, that the guarantee should be as wide as I have put it, that is to the British flag.

2666. What is your main object. Is it to secure the continued activity of our Mercantile Marine, or to secure the continuance of our supplies of food and necessaries?—To secure the continuance of our supplies of food and necessaries.

2667. Would you, then, include in the indemnity voyages between foreign ports?—I should, as a matter of fact; it is not necessary, I quite admit, for the supplies of necessaries to our own country, but I am dealing with the problem that would arise on the outbreak of a European war. "Between foreign ports" would, of course, include all Continental destinations. Such voyages, I think, should be included. You would have such a dislocation of our trade that the effects would be disastrous if you did not.

2668. I was thinking, for instance, of a cargo going from America to a port on the Continent, not, of course, being our enemy of the moment?—To a neutral port?

2669. To a neutral port. Have we any interest in giving an indemnity on that cargo?—I think so. I think our interest is the protection of our Flag.

2670. Would you do that in order to secure the continuation?—The continued employment of the Flag. That would be one great object.

2671. For the same reason you would extend the indemnity to export voyages as well as import voyages?—Yes. I think that would be necessary to keep our mills employed, to keep our trade going. I should wish to preserve our trade. I have tried to frame the scheme on the basis of preserving our trade as nearly as possible as it is in time of peace.

2672. Including in the term "our trade," our shipping trade?—Yes, our shipping trade.

2673. Not merely the goods carried, but the ship itself?—Yes

2674. On page 2 you say if the benefits afforded by the scheme are restricted to the cargo liable to capture the usefulness of the scheme is seriously imperilled. Have you considered the result of the alternative that you suggest?—Making it a full indemnity?

2675. Yes?—From what point of view?

2676. Will it not result in a good deal of cargo which is now shipped under foreign ownership, and which would therefore be neutral cargo, being transferred before shipment to British ownership, and becoming, therefore, belligerent cargo?—No. If you guarantee the Flag it will not be transferred to British ownership. I think, if you have the condition as given here under Scheme A, then you would get a great deal of neutral cargo transferred to British ownership in order to gain the advantage of the scheme. But under the scheme that I suggest that would be unnecessary; all cargo under the Flag would be protected.

2677. But the British-owned cargo, being the property of a belligerent, would be good prize?—Yes.

2678. Cargo that is neutrally owned would not be good prize?—Quite so.

2679. Why, then, should we give an indemnity?—Because otherwise you would give such a blow to our shipping trade, and you would increase the difficulties of making the scheme effective, for I do not think any merchant, if a neutral, shipping by a British ship, would allow his cargo to go uninsured against war risks, and the premium would be higher by a British ship. It would act against our shipping.

2680. Why should it be higher on neutral goods, not being contraband of war?—Because the ship might be a good prize. The cargo would be taken into a port not the port of destination; the neutral cargo might be released, but what is the good to a man of a cargo 500 miles from its destination?

2681. The temptation to the belligerent to condemn the neutral cargo would be very much enhanced, would it not, by the knowledge that if he did condemn it the British Government would have to pay the cost of it?—It might be, but I think the difference in cost is so small that it is a very small price to pay for the advantages. I have made my calculations on the assumption that that cargo would be a total loss, and there would be no recovery from it, whereas if we were the victors we could probably enforce recovery.

2682. By way of an indemnity after the war was over?—We might, but I have not made any allowance for that at all.

2683. I see in your note you quote Prince Bismarck—I understand with a view of suggesting that it would be unwise for us to rely much on the protection which the International Conventions dealing with war appear to afford?—That is so. I pay no attention to those at all. I think in the transactions of ordinary trade (the cost of insurance, etc.) no attention would be paid to any Treaties or Conventions.

2684. I am not sure that the citations that you make exactly bear out your argument. They refer to military alliances, contemplating common action many years ahead, do they not?—I read my meaning in it. I may be incorrect. That is what I take it to mean.

2685. You have looked at the context in the "Reflections and Reminiscences"?—Yes, I have read it through.

2686. I want to ask you a question or two on the subject of the losses to be covered. You say that in order to avoid difficult questions of responsibility the document of indemnity should be so worded as to be complementary to the policy of insurance?—Yes.

2687. By that I think you mean the ordinary policy of marine insurance?—Yes.

2688. That, I think, was the intention of our wording. Would you explain wherein in your opinion our wording fails to carry that out?—The wording in Scheme A is definitely against particular risks. You might have a doubtful case. I am looking at the possibility of an assured claiming, and it being held that he had no claim under this clause, and his then proceeding against his ordinary insurance in a Court of Law, and being told that he had no claim against that. What remedy has he got?

2689. What occurs now? Sometimes, I suppose, a shipowner has a war policy with one office, and a marine risk policy with another office?—Yes, and then it would be done in my way. The war policy would be against the risks excluded from the marine policy, and in case of a doubtful claim he would proceed against both, leaving it to the Court to say which was liable.

2690. Are there not risks which would not be covered by either?—As far as regards war?

2691. Yes?—I do not think I quite appreciate the point.

2692. The ordinary war policy covers you against the immediate consequences of hostilities. It does not, I think, cover you against loss of market, does it?—Loss of market arising from a definite war risk?

2693. Yes. To make my meaning clear, let me refer to some evidence we had last week: "In English assurances the underwriter is only liable for losses immediately caused, caused proximately by the perils against which he insures. He is not liable for the more distant result of those causes. Consequently, in the case of writing a war risk, we only pay for the actual damage suffered by the vessel, or the actual loss sustained by the owner through the capture, seizure, or damage of his vessel. We do not pay for any secondary result of that. For instance, in the case of produce, we pay for the loss of produce, but we do not pay for the loss of market"?—But your value is defined by agreement in the policy. There is no question. The market might have gone either way.

2694. I was asking you about cargo?—Yes, I meant that to apply to cargo. The insurance is done with an agreed value in it. It may be quite wide of the market value. The market might fluctuate either way, but the insurance would be for a certain sum.

2695. But then I do not understand what is the case in which you fear that the owner of the cargo would fall between his two policies?—I cannot tell that there would be any case, but you have two separate contracts, not necessarily connected with one another. You intend them to be, and you carry that out as far as you can, but litigation is always uncertain: whereas if you make the one policy definitely refer to

the other, and take the risks excluded by No. 1, the assured is in a very much better position.

2696. Does a war policy cover you for loss by demurrage?—No, not for loss by demurrage in the ordinary sense.

2697. But demurrage caused by inability to move in consequence of a war risk?—Demurrage, no. I think you will find that is covered by a judgment of Lord Justice Collins:—"All that underwriters on ships insure against is damage to ship, and expenses occasioned by detention or delay are damages suffered by the shipowner, but not to the ship." Of course, with regard to the cargo, it would apply equally. Demurrage does not come in.

2698. But suppose a ship were prevented by circumstances of war, by the presence of an enemy's cruiser in the offing, from leaving at the time at which it had intended to sail, that involves loss to the shipowner?—Yes.

2699. And may involve further loss to the cargo owner?—Yes.

2700. Would that be covered by an ordinary war policy?—No. That case also was tried in the Franco-German war. A ship with nitrate to, I think, Antwerp, put into Rio, and remained there for some months from well-grounded fear, as the Courts held, of French cruisers that were reported to be in the neighbourhood. The owners of the cargo brought an action against the owners of the ship for the consequences of the detention; it was held that the detention was justifiable, and the shipowners were not liable, nor would the underwriters be liable under an ordinary policy.

2701. No, but would you make the State liable in such a case?—No, I do not import any fresh liability.

2702. (*Mr. Beauchamp.*) I think there is really no difference between our scheme and your contention. All that we do is to state what losses are to be covered by the indemnity. You only explain how you think it is that should be carried out. We come exactly to the same thing?—Yes, I know we mean exactly the same thing. It is only a question of the better way of wording it. I think bankers and merchants would prefer to take my wording than the wording in Scheme A.

2703. (*Chairman.*) And you do not consider that your wording includes any more than ours?—No, not at all. It is only another way of expressing it.

2704. (*Mr. Lindley.*) It means having two policies complementary one to the other?—Yes.

2705. That is what they are now?—Yes.

2706. (*Chairman.*) But look at the note. We have suggested that losses through delay or diversion of route should not be covered, on which you comment that there should be no such qualification?—No such qualification is necessary, I think. You give the protection, and why qualify it in that way? Losses through delay are not recoverable as it now stands.

2707. Then it is not that you think they ought to be covered, but merely that you think the wording is not what it ought to be?—I think the qualifications are better left out.

2708. Now we will proceed to 3: "Conditions to be complied with in order to secure indemnity." You say that no such conditions such as are here suggested are necessary, except as defined on page 4, paragraph 4: "Compliance with instructions given by any duly authorised representative of the Government, as distinct from advice or information should be compulsory"?—Yes.

2709. Is there much difference between that and what we have drafted?—Yes. I think you provide here, in Scheme A, for a notification from shipowners of the intention to sail and furnish particulars, if required, and comply with any directions issued by the Admiralty. I would make any official instructions given compulsory; but, apart from that, I would let the trade go on in exactly the same way. There is nothing to be done unless there is a loss—unless, for good reasons, the Government consider certain action should be taken, and then compliance with those instructions should be compulsory; there should be no option.

2710. But you agree that the Admiralty must have power to exercise some effective control over the ventures?—Yes. Any instructions given by a duly authorised Government official should be compulsory.

2711. But if they are to make their control effective, must not they have some knowledge of what the shipping is doing?—I do not think more than public knowledge. They can get it at any time. There is no difficulty in getting it. But if you had all these instructions put in you would have an enormous mass of work, and I do not see what benefit you would gain. *Mr. F. Bolton.* 7 May, 1907.

2712. You contemplate that the instructions of the Admiralty would be general as regards particular routes or particular trades?—They might be general or they might be particular. The Government might choose to exclude routes within a certain radius of an enemy's country, for instance, or the Admiral in charge of a particular place might give orders that certain particular routes should be followed. If those orders were given, the compliance should be compulsory.

2713. (*Sir George Murray.*) Compulsory in order to secure indemnity?—If instructions were wilfully disobeyed, an innocent third party should not suffer. But I would penalise the man who disobeyed very heavily.

2714. But you would only penalise him so far as the indemnity was concerned?—If he was the owner, yes. But if property was imperilled or lost by the wrongful action of a man who was beyond all control, I would not penalise innocent third parties. For instance, if an innocent shipper shipped cargo in a steamer and the master disobeyed instructions, I would not deprive the shipper of protection.

2714*. (*Chairman.*) Would you make the shipowner responsible for the action of his master?—No.

2715. Then you contemplate that if the shipowner had given general instructions to his officers that they were to obey the Admiralty orders, and if a master of a vessel, in spite of those instructions, disobeyed, you would take penal action against the master, but you would accord the indemnity to the shipowner?—If the proper instructions had been given and there was no guilty knowledge or connivance in any way.

2715*. Must not you hold the principal responsible for the acts of his agent?—I do not think you should in such a case as that.

2716. (*Mr. Lindley.*) As a matter of fact, you do not now in a marine policy. There is a special clause put in to obviate that?—Yes; there is no new principle introduced at all.

2717. (*Chairman.*) Then we come to the basis of value. In your opinion it does not much matter what reasonable basis you take provided it is known beforehand?—That is so.

2718. I have asked one or two witnesses whether a reasonable basis would not be such as you suggest here, the original cost to the existing owner less a certain percentage. I think they have nearly all told me that they thought it would be unsatisfactory. That is not your view?—No.

2719. Would it not work out very unevenly in different cases?—It would work out unevenly to the extent to which the original cost was affected by variation of market. A steamer at one time may cost £30,000, and at another time £33,000 or £34,000; but the difference is not very much.

2720. The probability is that in time of war the value of a good steamer would be greater than it had been six months before the outbreak?—Yes, no doubt. That is why I speak of additional cost. I do not think that additional cost should be brought in to the charge of the State.

2721. So that you would not fully cover the shipowner for the then value of his ship?—I would not cover him for any added value that was dependent on the immediate circumstances.

2722. Would you allow him to insure that additional value elsewhere?—Certainly; that is why I say it does not matter so long as you have a reasonable basis. If the man knows the amount to which he is protected he can cover himself as much more as he likes.

2723. Would you place any limit upon the rights of the shipowner to insure for additional sums beyond the indemnity?—No, neither shipowner nor cargo-owner.

2724. Then might not both ship and cargo be very grossly over insured?—I do not think that would concern the State at all as long as they had no part in the excess insurance.

2725. In that case you would make your risk a much more hazardous one?—By introduction of moral hazard, do you mean?

Mr. F. Bolton.

7 May, 1907.

2726. Yes?—I think the general knowledge is too accurate nowadays for that to be a real danger.

2727. You contemplate that the Government might dispute the claim?—The Government would not dispute the claim unless they could prove fraud.

2728. Yes, but they might suspect fraud without being able to prove it. Such things do occur?—They do. I do not see how you could proceed on a suspicion.

2729. But would you not be very much increasing your risk of fraud if you allowed this double insurance?—I do not think you would increase the risk. Business is too much done in the open nowadays. Men have their reputations and their characters to lose.

2730. But we have been told by witnesses that the most profitable venture that a shipowner makes is when he loses his ship?—That is a rather unkind thing to say. It is not universally true; it is sometimes.

2731. It is sometimes true?—Yes, sometimes.

2732. At any rate, the possibility of further insurance in addition to the Government indemnity would make it possible for a man to recover more than the value that he had at stake?—Yes.

2733. In case of war the riskiest undertakings would always be the ones which would bear the highest profit, would they not?—Generally. Not always, I should say.

2734. Generally speaking. Will not the temptation to select the riskiest undertakings be very large if they offer to a man at once the highest profit if he is successful, and the certainty that he will recover more than he has at stake if he loses?—I have considered that, and I think it is covered by the compliance with the instructions given by any duly authorised representative of the Government. I fully anticipate that instructions would be given that would meet that. At any rate, I think they should be.

2735. Instructions to prevent him taking any improper risk?—Any improper risk, yes.

2736. Would you contemplate that, under certain circumstances, for instance, the instructions should forbid a voyage to or from the Baltic?—Yes, should forbid certain zones of trade.

2737. May I ask your reason for proposing that no transfer of fresh ownership within a given time previous to the outbreak of war should be recognised?—That is to avoid the excess values occasioned by the prospect of war. A steamer that is valued at £20,000 might at once go up to £30,000. I do not think the enhanced value should be the basis of compensation.

2738. I gather that all you have said generally in regard to the ship applies to the cargo. You are not afraid of fraud, for instance, under the invoice clause?—I am not more afraid of fraud under that plan than under any other.

2739. It has been suggested to us that with no premium, and the loss being recovered on the invoice price, all the invoice prices would be very high?—Practically a man shipping wheat from Calcutta, or wheat from Bombay or Kurachee, could not put in a false invoice. We know perfectly well we have only to refer to the reports to see what the price of a particular grade of wheat was.

2740. Then you propose to allow the cargo owner his profit, to indemnify him for the loss of profit as well as for the loss of cargo?—I put that in on the general grounds that I wish to maintain the conditions that exist in time of peace. In the ordinary way insurances are done generally invoice cost and 10 per cent. That is a very usual thing, but I do not think that is important as long as you settle the basis. If you settle the basis simply on invoice cost he can insure the 10 per cent. or any other percentage he likes.

2741. If you indemnify the cargo owner for loss of profit ought you not to indemnify the ship owner for loss of profit?—I do not think so, because under ordinary conditions the shipowner would be insured on a certain value, and the cargo would be insured on another certain value, and I should keep them as far as I could on the same basis that they would be before the outbreak of war.

2742. And under ordinary circumstances the value for the ship would not include the profits the ship was making?—No, that would be separately insured as freight.

2743. Would you indemnify the shipowner for freight?—I have not brought that into consideration here at all. I think if you are giving such advantages of protection to the shipowner, you might leave him to look after his own freight.

2744. Under the heading of settlement of claims you point out that the constitution of the Board of Administration would be a matter of considerable difficulty. You say you have no doubt a satisfactory arrangement could be made, but that it is probably the most difficult detail in the scheme. Would you give me your idea of what would be a satisfactory Board of Administration?—I thought it was hardly my place to go further than this. I think it would mainly have to be constituted by underwriters, because I think they are about the only people that would understand the work that would come before them. There are very few people living at any time—I do not know that there are a dozen at any time that I should say were fully qualified to be entrusted with such an operation. I have no doubt you could get the services of such men, but they are all men of high position—men who have great responsibilities upon them, and their responsibilites would be very heavy in time of war.

2745. That is what I wish to ask you about. Do you think it would be possible to get those men. Could they spare the time, or could they be spared from their own business at such a moment of stress?—I should think it could be done on national grounds, on patriotic grounds. I should think if you could find 12 of them, two of them could give one day each week by arranging among themselves. You do not want a number of men to settle things of this sort; you want two or three at the outside. Of course, the Government would be represented, and there might be a third man. There is no necessity to have more. An occasional meeting of a fuller Board for cases of special difficulty might be held.

2746. Of course, you would want to have the meetings sufficiently often to keep their decisions in harmony and on the same lines?—Yes, but in the ordinary way they are meeting every day, and it is perfectly easy to interchange views.

2747. Then you take exception to the suggestion that the decision of the Board should be final as to the validity and amount of claims?—Yes, I do not think you should interfere with a man's rights, the same rights he would have under an insurance policy.

2748. Then you would allow an appeal to the Courts?—Yes.

2749. But you attach particular importance to seeing that the claim should be paid forthwith by the Treasury on certificates issued by the Board?—Yes. If the Board were satisfied they would issue a certificate; if they were not satisfied they would let the assured go to the Court.

2750. But if you allow an appeal to the assured, you must allow an appeal to the Government, too?—Certainly.

2751. Would not that militate a good deal against the prompt attention of claims?—No, it would put them on the same basis that they would be under an insurance policy. I think that is all that could be asked.

2752. If there were any dispute on either side the settlement of the claim would necessarily be hung up?—Certainly, as it is now.

2753. Would it not be better in a case of this kind, where it is suggested the Government should give an indemnity free, that there should be some sacrifice of the right of appeal in order to secure a speedier decision?—I do not think so, for this reason. The greater part of our trade is done through banks. The provisions suggested would not make a good document for a bank. You might go to this Board of Administration and be told you had no claim; you might proceed to the Court and be told you had no claim on the ordinary insurance. I do not think any bank would take that risk.

2754. If, as you suggest, the ship or cargo owner were allowed to insure elsewhere, would not his policy be to cover him against all risks for which Government did not cover him?—No, I do not think that is the way in which it would be done. The insurance would be done possibly with a remedy against the Government. But I have tried to bring the thing down to the conditions obtaining before the outbreak of war, and if you are going to introduce any scheme of this

sort, to do it on exactly the same lines as our present commercial documents. If you make any difference you at once introduce difficulties, and the difficulties of the finance, I think, would be found to be very great.

2755. (*Mr. Lindley.*) You do not mean the finance of the scheme?—No, the finance of the trade. The whole of the trade now, or nearly the whole of it, is financed, and you must not introduce anything that frightens the bankers. The scheme, no doubt, would be sent by the bankers to their lawyers for criticism, and the difficulty suggested would largely stop operations.

2756. (*Chairman.*) On the other hand, you would admit, I suppose, that there is a considerable difference between a free indemnity offered by Government and a contract of insurance such as is usually entered into between an underwriter and a shipowner?—I do not think there should be. I think they should be on the same footing as far as possible.

2757. Then I pass to the advantages that you anticipate from the scheme. The principle advantage is, I understand, that you would obtain your normal supplies of food and raw materials?—I do not say at all you would obtain your normal supplies, but I do think you would remove a hindrance to obtaining your supplies. I think you would have difficulty in any case over your supplies, and this, I think, would remove one great difficulty.

2758. The difficulty being the fear of shipowners about letting ships put to sea?—The difficulty largely would be the actual interference of the enemy's war ships.

2759. Quite so; but, of course, so far as that is the difficulty, Government indemnity will not remove it?—If there were no Government indemnity, then you would get the ships stopped.

2760. What do you think would happen to the ships under those circumstances? Do you think that owners would lay them up?—Unless they had protection in some form or another, and I think if we follow the report of the Admiralty manœuvres in 1906, the losses would be so heavy that no owner would venture to go to sea; he could not get his insurances effected.

2761. You think it would be impossible for him to insure by the ordinary means?—I think the probability is it would be impossible to insure, and then, of course, no owner dare go to sea.

2762. There never has been any difficulty about insurance hitherto, has there?—There was in the Russo-Japanese war, towards the end.

2763. That was a very limited difficulty, was it not? It was impossible to insure vessels to two blockaded ports?—Not two blockaded ports. But Vladivostock you might consider a blockaded port. Of course it was not technically blockaded.

2764. Port Arthur was in the hands of the Japanese, and Vladivostock was, if not technically, practically blockaded?—Yes.

2765. Is that comparable to anything you can imagine in a war in which we were engaged?—I think so. I think the effect of the losses, if the losses are anything like such as I have given, which is less than half the percentage of captures in the last manœuvres, would be to stop insurance. I think as an underwriter the figures of losses I have given here would definitely stop insurance; you would not be able to insure.

2766. Are those losses a higher proportion than took place in the Great French War that took place at the beginning of last century?—That I cannot say, but I have not paid very much attention to the figures that are given there, because I think the conditions of trade are so entirely altered they are not comparable.

2767. I am very much disposed to agree. I was only putting that question for this purpose, that as far as I know there was never any difficulty in insuring then?—Values were very much smaller.

2768. So, too, was the market, was it not?—Yes, I suppose it was.

2769. The insurance market has expanded in proportion?—No, I do not think it is proportionate. But I do not think the conditions are in any way comparable, and the figures that have been given want greater analysis before you can place any reliance upon them.

2770. Then your fear is that without some scheme of indemnity insurance would become impossible, and as insurance was impossible ships would be laid up?—Ships would be laid up and ships would be stopped. The ships that were homeward bound with cargoes would be stopped. If I had a ship at Malta I should stop her where she was in safety, or at Gibraltar, or at any safe neutral place.

Mr. F. Bolton.

7 May, 1907.

2771. The immediate result of such action on the part of shipowners would be a rise of prices here, of course?—Yes.

2772. That would mean that the successful prosecution of the undertaking would be very much more profitable than the undertakers had contemplated when they started on it?—The prices might go to such a point that it would be worth a man's while to risk it. It would have to go to a very high point for that.

2773. A 10 per cent. rise in prices would be a very strong inducement to the cargo owners, would it not?—Not to the shipowner.

2774. But the cargo owners would then proceed to see what inducement they could offer to the shipowner?—But if you have a cargo valued at £20,000, say a cargo of wheat, 10 per cent., or £2,000, is not very much.

2775. What is the ordinary profit on a cargo of wheat?—I do not know.

2776. It would be something less than 10 per cent., would it not?—I should imagine so, but I do not know.

2777. (*Mr. Gladstone.*) About one per cent?—Yes.

2778. (*Chairman.*) Then you must not look at it as £2,000; you must look at it as the opportunity of earning a profit ten times as great as he has set out to get?—The cargo owner would have to offer such an inducement to the shipowner as would induce him to come along. But no such sum as £2,000 or £3,000 would induce the owner of a steamer to proceed to a place of danger without insurance.

2779. I should have thought history rather went to show that there were always plenty of people to take any risk?—At a price.

2780. At a price?—Oh, yes, I quite agree, if prices rise to such a level as to tempt the owners to proceed uninsured, but I say that level is a very high one, nothing like 10 per cent.

2781. I pass to your reason D. You say the loss would be more equitably distributed?—Yes.

2782. At present it is divided per head of the section of the population requiring the property destroyed?—Yes.

2783. Under this scheme it would be spread over the whole population?—Yes.

2784. Applying that to articles of luxury, shall I say ostrich feathers, is that a more equitable distribution of the losses?—It would depend upon how the taxes were arranged.

2785-6. Yes, but when you get to an article of luxury is there any reason why the general public should be called in to share the loss?—If you can discriminate without undue complication, without destroying the value of any scheme or interfering with the value of any scheme by such complication as to destroy the value of it, I see no reason why you should not discriminate.

2787. You see no reason why it should not be eliminated?—No. I think you would find it is not worth the complication and trouble; that is all.

2788. You would therefore be inclined to include everything in the scheme?—Yes, to make it as simple as possible.

2789. Bullion?—Yes.

2790. Bonds?—Certainly. I look upon bullion and bonds as much greater necessities than ostrich feathers.

2791. Then you say another advantage would be the continued employment of our mercantile marine. Perhaps that rather brings me back to the point I was on before. Is there really any ground for supposing that our mercantile marine, or any large portion of it, would be laid up for any length of time?—Yes, I think so.

2792. Must not that have the effect at once of increasing prices so largely, not merely here but in other markets, as to tempt the ships out again?—I

Mr. F. Bolton.

7 May, 1907.

think that is possible, but the price would have to be very high to do it.

2793. Probably in any war a very large part of our trade would be comparatively little exposed to risk?—I should say so.

2794. That would easily be covered in the ordinary insurance market?—Not easily, if the market had the shock of the losses elsewhere. A great many underwriters would simply refuse to touch war risks, irrespective of the place.

2795. Do you think that insurance on transatlantic voyages would be affected by pressure in the Mediterranean?—Yes, they would. Of course, there are a great many more underwriters than the men who actually transact the business, and I think a great many would have instructions that they were not to take war risks of any kind at any price.

2796. But you do not yourself think that the risks would be very great, say we were engaged in a European war, on cargoes coming from Canada or South America?—They would not be so great. But it would be very difficult to say. If you had a few cruisers off the west coast of Ireland it would introduce considerable danger.

2797. They could not remain there for long, could they?—Well, of course there are methods of coaling at sea now.

2798. Then as regards (f), you say that "discrimination against the British flag in favour of neutrals would be prevented." What is the extent of that discrimination? Wherein does it consist?—If we were at war and there were no scheme of indemnity, and you had to depend upon the ordinary insurance, the insurance under the British flag would be heavier than under a neutral flag.

2799. Although the only protection that our goods would have under the neutral flag would be the observance of the Treaties and Agreements which you advise us not to rely on?—I was thinking about imports to other countries, not to Great Britain. Such a very great percentage of the trade of the whole world is under the British flag, and from a neutral port to a neutral port under a British flag would be very much more costly to insure than under a neutral flag. I think it would act as a very heavy discrimination against us.

2800. But is there shipping in the world to take the place of the British mercantile marine if it was displaced by that risk?—I cannot say. You would probably release for the neutral trade the foreign shipping employed in our own trade, which is very large. That would be a rather difficult calculation to work out, and it would need a great deal of consideration to see how that could be done.

2801. Some of the witnesses who have come before us have suggested that the principal lesson to be gained from the Russo-Japanese war is that a neutral flag is no better than a belligerent?—That is a very common opinion.

2802. In that case the existing discrimination in favour of the neutral is not so much to be feared?—No, but that is in the employment of one of the belligerents. There is an enormous mass of our trade under our flag from neutral port to neutral port. It is there where the heaviest weight of the discrimination would fall.

2803. You say a little further down, that after all, the most important consideration is the strain that would be put upon the masses of the population by any abnormal rise in prices or scarcity of necessaries?—Yes.

2804. The prevention of such a rise or scarcity, of course, depends not on shipowners and cargo owners being indemnified from loss, but on successful arrival of the goods, does it not?—But you are assisting the successful arrival here. You cannot create another single cargo by any scheme you make, but you are removing hindrances to our obtaining the proportion we want of the cargoes that are available.

2805. Is it more than this, that you are helping to tempt them out, but you are not securing their safe arrival. You are not adding to the chance of the safe arrival?—You are not adding to the chance of the safe arrival, I quite agree, but there are many more that are making the attempt to come.

2806. And your belief is that, as a matter of fact they would not make the attempt without some such scheme?—That is my belief.

2807. I have read with great interest the figures as to cost you have been good enough to put before us. I think, as you yourself say, you feel that they are very speculative?—As to bringing down the cost on to any two weeks, I quite agree they are very speculative in that respect.

2808. And that, after all, the data on which you have to go for any speculation are very uncertain?—The data are certain.

2809. You have to settle in your own mind what proportion of loss there is likely to be?—For that I go to the report of the Admiralty manœuvres in 1906.

2810. Yes. At the same time, you are not prepared to take that proportion of loss as being the correct one?—No, because the Admiralty give you distinct notice that that is not the proper proportion.

2811. Quite so, but how much you shall abate that ratio of loss to arrive at the fair proportion is a matter on which you have formed the best opinion you can?—The Report gives a very good lead, saying that the intention was to send ships in convoys of twelve. They were sent in convoys of four. The four were captured, but if they had gone in convoys of twelve four would have been captured but the other eight would have got away, which is an indication, so far as the report gives an indication, that the enemy would capture about one-third, and I have allowed a margin on that.

2812. Your calculation only covers the first two weeks of war?—That is for the same reason, that the report of the manœuvres states that at the commencement of the third week we should have had all the enemy's cruisers either destroyed or hunted back into the shelter of their own ports.

2813. You think that practically after the first two weeks, basing yourself on that, the losses would be a negligible quantity?—A negligible quantity—that is to say, by giving two full weeks, the lessening that there should be towards the end of the second week, as our cruisers began to get power, would cover the value of the isolated cases of loss that would occur later.

2814. Of course, that was scarcely our experience in the great French war?—There, again, I think the conditions are so different.

2815. There is one calculation that I am afraid I have not quite understood. I do not quite understand why on page 3, where you are considering British steamers and their cargoes bound to Continental destinations, you take 30 per cent. of £6,958,698. I think I follow your 30 per cent., but why is it 30 per cent. of that £6,958,000?—That is the amount taken for two weeks of the capture of our home trade. You see a little higher up on page 3 I say two weeks at 50 per cent. Two weeks at 50 per cent. makes the same total as one week at 100 per cent., and 25 per cent., on the basis of the Admiralty Manœuvres Report, is the percentage I have taken for the actual capture. Then, in considering (a) to (e) in paragraph 2, I came to the conclusion that 25 per cent. of that amount was not sufficient, and 35 per cent. was too much, and therefore I took the mean of 30 per cent. The amount at risk of our trade to Continental destinations must be very much less than the value of our trade to home ports. That is where that amount of £6,958,000 comes from.

2816. But I understood you to mean that 30 per cent. of this foreign trade you thought might be seized?—Not 30 per cent. of the foreign trade, but the foreign trade lost by capture I estimate would be 30 per cent. of the £6,958,000, the value of the British trade captured. That was formed simply on the general considerations (a) to (e). I then set to work to see if it could be proved. I could not see at first how this could be done. That is why I have given another estimate, the justification of that 30 per cent. I get that on the basis of our ballast entries, working back.

2817. But you have first taken, as I understand, 25 per cent. of the whole trade; that is £6,958,000?—Yes.

2818. That £6,958,000 is 25 per cent. of the whole trade, is it not?—The weekly amount at risk is £27,834,000, and 25 per cent. of that is £6,958,000.

2819. Yes, and that represents the probable captures on the whole of the trade?—On the whole of the trade to and from the United Kingdom.

2820. But then you take 30 per cent. of that loss as being the loss on cargoes between neutral ports?—Bound to Continental destination; largely from neutral ports.

2821. But should it not be 30 per cent. of the trade passing between those neutral ports?—No. I think that is proved by the justification of that estimate. We only take 25 per cent. of our own trade.

2822. I do not understand. What is the connection between the losses you may expect on the trade coming to and leaving home ports and the losses on the trade passing between two Continental ports?—It was very difficult to find any way of dealing with that, and it was on the general impression that one had from one's knowledge of the movements of trade, considering (a) to (e), that I came to the conclusion that 30 per cent. would be about the amount. Later I have proved that by working backwards from the ballast entries of ships arriving in our country from Continental ports, and that is fully worked out in this justification which follows. I bring my total there to £1,836,000. Some allowance has to be made in addition for values of cargoes loaded outward from Continental ports, and the steamers, so that I think the value of £2,087,000 is about the nearest estimate you could get.

2823. But there is nothing more than an accidental relation between the loss on the home trade and the loss on the trade passing between Continental ports?—It was perfectly speculative, but on consideration of (a) to (e) I came to the conclusion that 30 per cent. was the nearest even percentage I could get.

2824. But why did you state the loss on the foreign trade as a percentage of the loss on the home trade. The loss on the home trade you state as a percentage on the whole home trade?—Yes.

2825. Why did you not state the loss on the foreign trade as a percentage of the whole foreign trade?—I had no means then of getting at the percentage of the foreign trade. I have since arrived at a justification by working back from the ballast entries.

2826. (*Sir George Murray.*) I should like to go back to the question on which you have already touched, of whether the indemnity should cover neutral cargoes conveyed between neutral ports in British ships. You are in favour of extending it to that?—I think so, on the ground of simplicity and greater power of the scheme.

2827. That, of course, would be a measure purely in the interest of the British shipowner. The community at large would have a very indirect interest in that part of the question?—It would be, I take it, chiefly in the interests of the shipowners getting the employment, but I think the community has a very great interest in keeping our shipping population employed.

2828. It has a less direct interest than it has in cargoes consigned to British ports or exported from British ports?—Yes.

2829. A very much less direct interest?—Certainly.

2830. Do you think that a scheme conceived so entirely in the interests of one industry could be justified?—I think that is only a small section of the scheme. I think the difference in the amount would be found to be so small that it would be a pity to restrict the scheme at all.

2831. It looks as if it would be rather a large item according to your subsequent calculations?—Which calculation do you refer to?

2832. The amount of trade which you calculate as being carried in British vessels between neutral ports. It is £2,000,000 a week, is it not?—The value of the steamers and their cargoes bound to foreign ports?

2833. Yes?—That is £2,000,000 for the two weeks. That is what I calculate. You are speaking of the loss, are you not?

2834. Yes?—The loss is £2,000,000.

2835. But still you think it would not be worth spoiling the scheme on that account?—I do not think so. If we are ever unfortunately engaged in a European war the amounts involved are so huge that anything like £2,000,000 is not worth spoiling a good scheme for. And it would spoil the scheme. It would dislocate the arrangements a good deal. It would dislocate the employment of British shipping in your own home trade and elsewhere. It would create a good deal of difficulty.

2836. Would you expect the extra insurance on neutral goods in British vessels under those circumstances to be substantially higher than in neutral vessels?—If there were no scheme?

2837. Yes?—Certainly; much higher.

2838. Very much?—I should think so.

2839. That looks as if the Declaration of Paris were not of very much value?—I do not think it is of any value. I have stated that I pay no attention to that at all.

2838. Very much?—I should think so.
be adhered to?—It would not be adhered to, as I believe.

2841. Then, as regards the insurance over and above the indemnity, to whatever extent that goes on the main object of the indemnity would be defeated, would it not?—I think you would have to allow some such scheme as that, because any reasonable value that you fix upon beforehand could not cover the requirements of every case. I think there would be cases of real injustice if you limited it to the amount of the indemnity, and I do not see any real reason in practice why it should be limited.

2842. Except that you would have all the disturbing influence of rising rates of insurance, and so forth, which is, after all, one of the main things that the indemnity is intended to prevent?—I think, if I may say so, one of the main objects I had in view there was the removal of restraints and restrictions on the supplies of foodstuffs.

2843. (*Sir George Clarke.*) I think you said you consider a scheme of national indemnity would be desirable, but you have told us practically that, if nothing of this kind is done by the State, our shipping would all be laid up, and there would be no insurance at all; so may I say that you regard such a scheme as essential?—Yes, and I have said that I consider the Government would be forced.

2844. Yes. Then you say the Government would be forced to it sooner or later, but is it not sooner rather than later?—No, I think it is rather later. The pressure would come after the losses. I think the necessity to bring forward such a scheme would come after the effect of the losses of the first two weeks.

2845. Then you think the losses of the first two weeks would be covered by the ordinary methods of the underwriting market?—If there were no scheme they probably would be, and it is the later supplies that would be interfered with and stopped.

2846. I suppose you expect there would be a general rise in freights in time of war?—There always has been. I have no doubt there would be.

2847. And I think you have told us that neutrals would probably have to pay war insurance rates themselves, judging from the experience of the Russo-Japanese war?—To this country?

2848. To any country?—No, I do not suppose neutrals would, between neutral ports.

2849. No, but neutrals going to our ports?—To our ports, certainly.

2850. Therefore, neutrals dealing with any belligerent ports, and possibly with any other ports (because you have said we must not regard Treaties as sacred things), would have to pay war insurance rates?—Certainly, bound to any belligerent ports.

2851. Then you expect a rise in market prices in war time?—No doubt.

2852. And no doubt our Government would have to employ a large number of ships for transport purposes?—Yes.

2853. Then, if there is a complete indemnity for the ship and cargo owner, is not he placed rather in a better position in time of war than he would be in time of peace?—I do not see that he is placed in a better position. I have no intention of putting him in a better position.

2854. Everything is in his favour except capture. If you remove all risks of capture from him it seems to me he is in a better position than he was before?—I take it that there are a great many trades that would be benefited in the event of war by the rise of prices. You could not help it. A shipowner, if he were free to employ his shipping in any way, would no doubt get the advantage of the higher freights.

2855. Taking all those points into consideration, do you not think it would be a fair criticism against Scheme A that it put the shipowner and cargo owner in an exceedingly privileged position?—I should not admit it was an exceedingly privileged position. It

Mr. F Bolton.

7 May, 1907.

Mr. F. Bolton.

7 May, 1907.

is done for the national benefit, and in carrying out a scheme for the national benefit you cannot help benefiting a particular class. No doubt by the scheme of indemnity you do benefit shipowners and cargo-owners, but you cannot help it. You do not do it for that purpose. That is incidental.

2856. And I think you lay stress on the point that the State should make good to shippers profits as well as actual loss of cargo?—I have laid no stress upon that. I have said that the basis does not matter as long as it is a settled basis.

2857. You also laid stress on the power of instituting law actions against the Crown?—Yes, I did that for banking purposes.

2858. And you think that if that was admitted one of the objections to a State guarantee would disappear?—I do not feel any objection to a State guarantee; I advocate a State guarantee.

2859. You approve of that power of appeal?—Yes.

2860. To some minds it has appeared objectionable that there should be a decision from which there would be no appeal. Do you think it a point that we should consider?—Yes, I think it is. I think it would be a great hindrance to a scheme to make the decision of the Board of Administration final.

2861. It would make it more palatable generally to business men if there was a Court of Appeal?—An appeal to the Courts.

2862. In the calculations that you have made as to possible losses, which you based upon the experiences of the manœuvres, had you any particular war or any particular enemy in your mind, because, of course, that would affect the amount of capture very much?—Yes, I had. I was considering Germany.

2863. Germany alone?—Germany alone.

2864. In that case, do you not think your percentage of capture is high?—Not looking forward, I think, to the time when they are ready for war.

2865. You are putting it some years ahead?—Yes.

2866. Of course, you see that any argument based on those manœuvres would involve the assumption that the enemy was able to act in as great strength relatively to our fleet as our Blue Fleet?—Yes.

2867. As regards Scheme B, which you have made some remarks upon, I see you say: "Apparently it is intended that the State policies shall be issued in time of peace. In practice this would probably mean that the scheme would remain a dead letter until there was serious apprehension of war." That, no doubt, is so, because I suppose in peace time war insurances are taken at a very low rate?—Yes, at a nominal rate.

2868. What is the objection, then, to the scheme remaining a dead letter until there is a serious apprehension of war?—I do not know whether I misunderstood the scheme, but I understood part of the scheme was that it was to come into operation in peace time. I see no reason why it should not remain a dead letter in time of peace.

2869. And if it was there in time of peace, and simply remained a dead letter, but available for anybody, it would be resorted to only, I suppose, when a scare of war became rather acute?—Yes.

2870. Would not that be a good thing?—My main objection is in the second paragraph: "No indication is given of the system on which the premiums are to be fixed."

2871. Supposing a premium were based upon an assumption pretty much like yours, of the number of captures over a certain time, and that it was varied according to the voyages—a very rough method, I admit—and we arrived at certain fixed rates, which, if the captures were spread over the war would fairly come near to a balance; supposing something of that kind were arrived at, dealing with the war as a whole, and the rates were fixed in time of peace for certain sections of the world, certain voyages, so that everybody knew at all times, if war broke out, or if he thought war would break out, he could come and take out these policies at once, would you say what were the inherent objections to that?—Well, it would be simply used by the assured, or the people who desired to be the assured, for the zones where they would be favoured by the premium. That is to say, if there were a danger zone with a premium of 5 guineas, and the scheme premium was fixed at 2 per cent., of course the Government would get all the insurances for that zone, and you could not fix the zone from day to day.

2872. No, not at all; it could not be varied from day to day?—It could not be varied from day to day, but your zones do vary from day to day. So that the premium which may be fixed at 2 per cent. to-day may be worth 8 per cent. to-morrow, and the next day may be down to 1 per cent.

2873. Do you see any particular objection to that?—I do not see how it secures the benefits at all. The insurances would still have to go on, except in cases where the people who desired to be assured could find a cheaper market with the Government, which I think is most objectionable.

2874. I do not quite see why. They are perfectly free to do which they like. The State says: For national purposes we will give you a certain rate; you can take it if you like, but you may do better?—Then the State would only get the risks where the market valuation of the risks was in excess of the premiums demanded by the State.

2875. Exactly. Under Scheme A the State gets the whole of all risks without any refund of any kind; still it is more equitable for the State to get something than to have all the liability and get nothing?—No. I cannot see that, because the insurance is only a method of distribution. An insurance does not vary the loss in any way. The actual loss to the community exists and has got to be made good. Insurance is only distribution. If you distribute that through the taxes you come back on to your units of the community.

2876. Yes, but from the point of view of the Treasury and the taxation of the country, surely it is a different thing whether you are going to get some recoupment, or whether you are going to bear the whole loss without any?—But there must be a sense of proportion in it, and there cannot be any proper proportion with a premium fixed before the event.

2877. Then you have rather told us that certain heavy captures in the earliest period of the war would necessitate very high and quite exorbitant rates at later stages. Is that equitable?—That you cannot control, except by such a scheme as a scheme of indemnity.

2878. My point is that the insurance rate at any time is fixed, as you have admitted, by what has happened before. Therefore, a zone which has been raided may become hazardous, from the underwriter's point of view, though it may be perfectly safe. Therefore, there is no relation between the risk that at any moment may be charged to the shipowner and the actual risk in any part of the world?—I do not think I could go as far as that.

2879. But nearly as far. You have said that the high percentage of captures at the early part of a war, though they might not be followed by many captures afterwards, would certainly influence the later rates?—But I have explained that I think the number of underwriters would be very limited who would take any war risks at all. I think you would find it would be impossible to do the insurances. It would not be a question of rate.

2880. It is from that point of view, if the underwriters are going to disappear, that a State rate, even if it was not more scientifically fixed than the underwriter would fix it, would be a certain gain. The ship and cargo-owners would, at all events, have something they could do, and there would be a certain sum that they knew they would have to pay, and therefore their business would not be disturbed?—I think you would find the machinery of it would be almost impossible.

2881. Your main objection to Scheme B is that you do not think it is an equitable distribution of loss?—I do not think it is an equitable distribution of loss, and I think the mechanism of the working of it would be very difficult.

2882. Would not the mechanism be exceedingly simple if you accepted the principle of rates fixed now in time of peace?—I cannot see the equity of that.

2883. Putting aside the equity, the machinery would simplify itself if that could be done?—It would be perfectly mechanical if you had certain zones at certain prices.

2884. All the difficulty of the machinery would disappear. Then we come back to your main objection to any form of Scheme B which is that the distribution of the losses among the people of this country is not equitable?—That is one objection.

2885. But that is the main objection, is it not?—No, I do not know how you are going to start on the basis of premiums. That is why I say I want to know the system on which that is done before I can criticise it.

2886. Of course, as we see, there can be no absolute fixing of ether the underwrters' rates or the State's rates. They must be rather guesses?—Yes, but n the case of the State rate you practically fix it for a long period. You cannot alter that quickly.

2887. We should not be able to alter that at all. However, your main objection is that you do not think it is equitable?—I do not think it is equitable.

2888. (*Mr. Beauchamp.*) You consider that the owner of any cargo carried in any British ship ought to be indemnified?—Yes.

2889. But if the ship is captured neutral cargo is not liable to capture, and cannot be condemned, but the cargo is left at a distant port, and the expense of sending it forward to its destination would be very great. Would you suggest in that case the State should pay the expense of getting that cargo to its market?—As soon as it is captured it is a loss, if the necessary measures are taken.

2890. But it is not a loss; it is not condemned in any prize court?—But it is captured; it is a loss under the clause.

2891. A loss under what clause?—Under Clause 2.

2892. And you think that the State ought to pay for that?—Yes.

2893. Although the cargo is in existence?—The cargo would then become the property of the State. There would be a salvage on it.

2894. You think that that ought to be done, and that it should not be limited simply to that which is really liable to capture and condemnation?—I think so, unless you can make sure that the Treaty of Paris is going to be observed.

2895. But I am assuming that the Treaty of Paris is observed?—I am assuming that it will not be observed.

2896. But, in any case, what does it matter. Are you referring to neutral cargo in a belligerent ship?—Yes.

2897. You think it would be captured and condemned?—I think it would be captured and very likely condemned.

2898. Then would you not say it would be covered by the words "liable to capture"?—No; it might be illegal. We have had plenty of those cases of illegal captures.

2899. Then I come to the question of the Board of Claims. You think, in the first instance, it would be a little bit difficult; but assuming you could get a satisfactory Board to consider the validity and the amount of the claim, you do not think that their decision ought to be final?—No.

2900. And that there ought to be liberty for it to be carried up to a court of law?—In case of need, yes.

2901. Although this is a gratuitous thing, the indemnity is gratuitous, it is something given without any payment of any kind. Under those circumstances ought not the State to be allowed to regulate the terms upon which it gives it?—I do not think so. I think you would find the bankers would refuse the guarantee. You would spoil the scheme. Of course, I am not a lawyer, but I do not think any lawyer would advise a bank that they could safely take the risk on those terms.

2902. But if the beneficiary had a right of appeal the Government would also have a right of appeal. Therefore, would not that rather operate to produce delays in the payment of these claims?—Only in doubtful cases. Any clear case, of course, would be settled at once. There would be no dispute at all; but in doubtful cases I think emphatically there ought to be the right of appeal to the courts.

2903. You think that both parties ought to have the right of appeal?—Yes.

2903*. (*Sir George Murray.*) I did not quite catch what you thought the bankers would object to?—To a guarantee that makes the decision of a Board final.

2904. Why should they object to that decision rather than a decision of the court?—Because, in a doubtful case, the Board might give the decision in their own favour, on the ground that they honestly thought it was a claim under the ordinary insurance. The ordinary insurance may be taken into court. The court might hold on legal grounds that there was no claim. There would be no power to take the indemnity to the same tribunal as the ordinary insurance.

2904*. (*Mr. Beauchamp.*) No, but if they paid, the Government would have the rights of the assured subrogated to them?—Yes, if they paid.

2905. Under any circumstances?—Yes.

2906. They would be able to take it to the court to decide whether the loss was a marine loss or not?—But that involves payment on the part of the Government, and I say that the Government, quite rightly, ought to have the right of saying they are not liable.

2907. Then do you not think that that would be liable to produce delays?—Only in disputed cases.

2908. There must be a certain number of cases where there would be a dispute?—They would arise under any system of insurance, and I do not think you ought to make any improvement on the ordinary conditions. I am trying to keep this on the same conditions as they would be in the ordinary commercial operations.

2909. Then, on page 5, you speak about the better distribution of the loss. In what sense would it be better distributed than by its being borne by the section of the population requiring that particular kind of property?—If you double the price of bread, the poor man has to bear it in exactly the same way as the rich man. They both have to pay a higher price for the loaves they use.

2910. Yes, but there is not only bread, but other things?—I only instance that, but it would apply to all the necessities and comforts of life in the same way.

2911. Yes, as long as you limit it to necessities, but when you get into the question of luxuries the same thing does not apply?—Then that would be the affair of the Government, to take care that the distribution was equitable.

2912. But how could they arrange for that?—In the the same way, I suppose, as the Chancellor of the Exchequer arranges for the taxation nowadays.

2913. By means of taxation, you mean?—By means of taxation.

2914. Greater taxation on luxuries?—Yes.

2915. Then one object you have in view with regard to this indemnity is to prevent any interference with the full working of our mercantile marine, because such interference would involve a serious dislocation of industry. Would not that argument apply in equal force to all work stopped in consequence of the war. It is to prevent people being thrown out of employment to a certain extent?—Yes.

2916. If you have a scheme of this kind to compensate people for being thrown out of employment, would that not apply with equal force to all cases where people are thrown out of employment in consequence of the stoppage of their work by means of war?—Not with equal force, I think, because this goes back to an original cause for stoppage. If you cannot bring in your raw materials, you cannot keep your mills at work, and this is to assist anything of that sort. That is only one of the subsidiary advantages. The main advantage is the one I have given under Clause C, to bring in the supplies, and, incidentally, you do other things. As I said just now, you benefit shipowners and cargo-owners, but you cannot help that

2917. You rather lay stress on that?—Yes. I do not say that the full working of our mercantile marine, and all that follows from it, is the most important, but I think that is one of the more important operations.

2918. Then you say that unless some scheme of this kind is introduced certain hurried measures would have to be taken to meet a great emergency?—Yes.

2919 What measures do you contemplate?—A hurried measure of indemnity in some form, or bonus. You would have to get commodities in. You would have to compensate both cargo owner and shipowner to such an extent that they would come in. That might take the form of indemnity, it might take the form of a money payment, but you would have to get the commodities here at all hazards.

2920. That is assuming there is a serious break in the continuity of our supplies?—Yes.

Mr. F. Bolton.

7 May, 1907.

2921. Then we come to the estimated cost to the country under this scheme, and you assume that we shall suffer two full weeks of the maximum rate of capture before we gain complete mastery of the sea. Do you assume that these captures would be practically limited to the first two weeks?—I am going on the report of the Naval Manœuvres.

2922. You are assuming that?—I am assuming that.

2923. Then the cost to the State would be roughly 10½ millions?—Yes.

2924. That would be the whole cost of the whole of the war?—Yes.

2925. And after two weeks captures would practically cease?—Yes. I proceed on that assumption.

2926. Then the danger period would be limited to those first two weeks?—No, the danger period is subsequent. It is the effect of the losses of those two weeks that I fear.

2927. But if there were no captures after the first two weeks the insurance world would soon settle down?—It would settle down after some time, but it is that interval I am afraid of.

2928. How long do you estimate it would be?—I cannot say. I think it would be a considerable time.

2929. If it were generally known that we had obtained complete mastery of the sea, do you not think that the insurance world would quickly be reassured?—No, not quickly, after such losses as these.

2930. If the danger were to cease at the end of two weeks, do you consider it would be necessary or wise to elaborate a scheme of this kind when at the end of a few weeks things would come into the country just as easily, or almost as easily, as they did before?—I do not think they would. I think it is necessary to have a scheme of this sort, or desirable at any rate. I think it is necessary. I do not think you would get them to come in, because although the captures might cease at the end of the two weeks, as anticipated by the Admiralty, the effect of that would not pass.

2931. But it would not take very long, would it, before it did pass?—I think it would take some considerable time.

2932. What time do you anticipate?—I have not given any thought to that, but I think it would be a considerable time.

2933. (*Mr. Lindley.*) I gather you are practically in accord with Scheme A, except in one or two small details. One of these is the question of notice to be given by the shipowner. I should like to know what your reason for not wanting the shipowner to give notice is?—I want to avoid every complication that I can. I do not see the necessity of it.

2934. Supposing no notice is given, how is it possible for him to be under complete control of the Admiralty?—The Admiralty would give public notice.

2935. Yes, but that I take it would only be general, and there would be sometimes special instructions required, would there not?—The public notice could be given through every shipping office in the kingdom.

2936. You do not think it would be necessary to have any private communications with any of the shipowners?—I do not think it would be necessary, but that is a detail that I do not lay any stress on.

2937. I was merely asking because I did not quite understand. With regard to the question of the values, have you any special preference with regard to the value for the cargo, for instance?—No.

2938. I mean you mention three different ways of arriving at the value here: invoice, cost, freight and marine insurance, plus profit, market price at port of origin, or port of destination. If you take the market price at the port of destination, that undoubtedly includes profit, does it not?—I think that is the least desirable one, because that would deal with a fictitious value.

2939. That is what is avoided in the suggested method of arriving at it in Scheme A?—Yes.

2940. Then you do not mention freight at all. That is mentioned in Scheme A. You see under clause (b) it is "the value of the cargo at port of shipment plus insurance and freight to port of destination"?—Does that mean freight payable in advance?

2941. If it is not payable in advance it is payable to the shipowner. Is there any objection to the shipowner being covered for his freight?—I do not see any special advantage. I think the shipowner gets such advantages under the scheme that I should not carry it any further; that is all. I see no objection in principle.

2942. Then with regard to the question of your estimate of the losses, I gather that you consider the weekly trade with the United Kingdom amounts to about £27,000,000, and that the Continental trade would be about 30 per cent. of that. Is that right?—That is not quite right. The 30 per cent. is the 30 per cent. of the loss.

2943. Are not you allowing the same percentage of loss, in getting at the £2,000,000 you mention subsequently, as you have on the home trade, that is 25 per cent.?—I do not think so, but is there any point on that, because it is rather an elaborate calculation to go through?

2944. I mean that is what struck me. I was looking at the figures that the Chairman mentioned. I was trying to get at the comparative figures?—You have only one coast line, and you must for the greater number of continental destinations be more limited to danger zones for any European enemy; therefore I have doubled the capture rate for the continental destinations.

2945. That means that instead of being 30 per cent. of the value it would be 15 per cent?—I am not quite sure. I should like to work that out.

2946. It looks like that on the paper?—No, because I have given 30 per cent. of the loss, not 30 per cent. of the trade.

2947. (*Captain Ottley.*) I should like to ask one question with regard to your views on Scheme A. I think you clearly prefer Scheme A to Scheme B?—Yes.

2948. But in answer to Sir George Clarke you admitted that there is an objection to Scheme B, although you do not think it is a serious objection, from the fact that it discriminates in favour of one particular British industry at a time when the whole of the British community would be feeling the results of a war, that is to say, that the British shipowner would be indemnified against all losses, whereas the rest of us who are not shipowners would not be indemnified to the same extent?—Yes, the shipowner has an advantage, but you cannot help it. It is not done for that purpose.

2949. Do you think it would be possible to in any way remove what might be an objection from the point of view of the House of Commons to Scheme A by suggesting that we might charge either registration fees or stamps on bills of lading, on tonnage dues, or even in the last resort a small tax, so as to build up a fund out of which these sums of indemnity should be paid?—I have not considered that. Without consideration I should say I see no objection. The scheme might have to be manipulated in order to get it through the House of Commons. That might be the price that would have to be paid for it. But I do not think it is important.

2950. Then with regard to the war premiums to be paid by neutral ships in a war in which Great Britain was a belligerent, I quite understand that neutral ships plying between neutral ports would, you think, not have to pay war premiums at all?—I do not think so.

2951. But you think that neutral ships plying to British ports would have to pay war premiums?—That is so.

2952. Do you think that neutral ships plying to British ports woud pay the same war premiums as British ships plying to British ports?—It is very difficult to say. That is the experience of the late war, I think. The premiums would be much more equal than they would have been before that experience. But until we came to the actual operations we could not say how it would work out.

2953. But I suppose you would agree that the late war presented certain rather exceptional features, that is to say, that the mercantile marine of Russia was comparatively small, and a very large number of the Russian ships were taken up to act as fleet auxiliaries?—Yes.

2954. And therefore if Russia was to get anything at all into her ports it would have to come in neutral bottoms?—Yes.

2955. Therefore it was natural that Japan should eye with suspicion, perhaps, any neutral?—Quite natural.

2956. And perhaps act with rather more severity against neutrals than would be likely to happen in any future war?—But I think underwriters would take the view that it would be likely to happen again.

2957. You would go by experience. Then, with regard to the value of a ship on the outbreak of war, in answer to the Chairman, you said you thought it was very likely that after the outbreak of war the value of the ship would be enhanced?—Yes.

2958. I was going to ask you, apropos of that, whether that would be true in all cases. Would that always be so? Put the case of Great Britain, the greatest of naval Powers, at war with some Power not strong at sea, how would the fact of British victories affect the value of our enemy's mercantile marine?—I think the effect of any war would be to increase the freights, to harden the freight market. If the freight market was hardened the value of steamers would rise.

2959. Notwithstanding the fact that in this particular instance those ships could hardly sail to sea?—I think so. I think that would be an effect that you might rely upon, the value of shipping would go up on the outbreak of war. You might have a condition that would vary or stop that a little later on, but I think at the time, the effect would be that the value of shipping would go up.

2960. But as the war went on and it became increasingly evident that the weaker of the two belligerents at sea could not sail the sea, would not that bring down the value of his ships?—I do not think so, because there is so much more employment for shipping in time of war. There is so much shipping, as the Chairman says, that would be taken up for Government uses. It limits the rest, and gives such an amount of employment that I think you will find freights would harden and the value of ships would rise on the outbreak of any war.

2961. (*Chairman.*) Your real fear is, I gather, that shortly after the outbreak of war shipping would be laid up?—And would be stopped at various ports.

Mr. F. Bolton.

7 May 1907.

2962. That is a very expensive course for the shipowners to take, is it not?—Not in a home port.

2963. In some of the instances you were giving me he would have been away from home?—Yes, that is expensive.

2964. Then all his charges would be running?—Not all, but it would be an expensive operation.

2965. Even in a home port, apart from loss of profit, there would be a good deal of charge, I suppose?—No, not much; two men.

2966. (*Mr. Lindley.*) Two men, do you say?—One to turn the engines and one watchman.

2967. (*Chairman.*) Is not there a considerable loss from depreciation if a ship be laid up?—Yes, there is a loss in a way, but it is not very important. All your steam connections get very dry, and packing has to be renewed, and things of that sort; but it is not important.

2968. To induce the shipowner to put to sea you would have the better freight market of which you spoke in your reply to Captain Ottley in the first instance, the high prices of commodities which would enable them to bear higher freight; and, lastly, the charges to which he would be put if he laid his ship up?—Yes.

2969. The dead loss that he would incur by so doing?—Yes.

2970. Do you still think that many ships would remain laid up or stopped in port?—Certainly you could not risk the loss of your ship. Most ships now are owned either as private companies or as units in a larger company, a more or less private company, and no manager could face his shareholders and report the loss of a ship uninsured when he had had the opportunity of keeping her in safety.

FOURTEENTH DAY.

Tuesday, 28th May 1907.

PRESENT:

The Right Hon. Austen Chamberlain, M.P. (*Chairman*).

Sir Thomas Glen-Coats, Bart., M.P.
Sir James L. Mackay, G.C.M.G., K.C.I.E.
Sir George Sydenham Clarke, G.C.M.G.,
Sir George H. Murray, K.C.B.
Mr. H. Llewellyn Smith, C.B.
Captain C. L. Ottley, R.N., M.V.O.
Mr. Edward Beauchamp, M.P.
Mr. Henry Neville Gladstone.
Mr. Frederick Huth Jackson.
Mr. George H. Duckworth (*Secretary*).

Sir Robert Giffen, K.C.B., F.R.S., called and examined.

Sir Robert Giffen, in a preliminary memorandum,* had submitted:—

(1) That the value of British trade and shipping exposed to risk of capture in any one year may be put at not less than £2,000,000,000, the items being:—

	Millions. £
(a) Imports and exports	1,069
(b) Transhipment trade	29
(c) Bullion and specie	125
(d) Coasting trade	100
(e) Sea fisheries	12
(f) Diamonds	10
(g) Value of ships belonging to U.K.	212
(h) Cargoes in British ships trading abroad	600
	2,157

(2) That a universal indemnity against capture would mean £20,000,000, allowing only for 1 per cent. of captures, and would have to be paid at a time when the country would necessarily be subject to heavy taxation and while heavy losses in other directions were being incurred.

Sir R. Giffen, K.C.B., F.R.S.

28 May 1907.

(3) That it is impossible to contemplate a serious war without the added danger of financial panic, leading, as in other times of stress, to large gold withdrawals from London.

(4) That an indemnity in certain cases and on strict conditions would be open to fewer objections than a universal indemnity, which should not be lightly offered.

(5) That strict obedience to Admiralty instructions would be an essential condition.

(6) That persons wishing to be indemnified should contribute towards the cost of indemnity on the ground that they are in receipt of a special advantage as compared with the rest of the community, and also as a restraint on unreasonable ventures.

(7) That the Treasury and Admiralty should be empowered to settle claims and make regulations under a general Act of Parliament.

* *Vide* note, p. iii.

Sir R. Giffen, K.C.B., F.R.S.

28 May 1907.

2971. (*Chairman.*) You gave evidence before the Colonial Defence Commission in 1879, as to the magnitude of British trading and shipping interests?—Yes, that was so.

2972. Will you give us a statement of the same kind?—I thought that would be the most proper way in which I could begin my evidence, and would give you something to go upon. The value of British trade and shipping exposed to risk of capture in one year may be put at not less than 2,000 millions. The items are—I give the actual figures for 1906—imports, 608 millions; exports, 461 millions; total imports and exports, 1,069 millions. Second, taking the transhipment trade, the figures I give are for 1905, from the Statistical Abstract: Imports and exports, each, 14.3 millions, the total round figure being 29 millions. For bullion and specie, the third item, the actual figures for 1906 are: Imports of gold 46 millions, silver 17 millions; total 63 millions. Exports of gold 43 millions, silver 19 millions; total 62 millions. The aggregate is 125 millions of bullion. Then the next item (4) is the coasting trade, where I estimate the imports and exports at 100 millions. The next item (5), is the produce of the sea fisheries of the United Kingdom, 12 millions. That, again, is an actual figure. The next figure (6), is that of diamonds, which are not included in the exports and imports, but where you have a figure stated of the imports from the Cape. The estimate is 10 millions. The figure for the imports from the Cape is stated at 6 millions. The next item (7), is the value of ships belonging to the United Kingdom. The steamers are 9 million tons, upon which I put the figure of £20 per ton, a moderate figure, I believe, making a total of 180 millions. The sailing ships, 1.6 million tons, are valued at £7 10s. per ton, and amount to £12,000,000. Bunker coal and provisions represent £20,000,000. The total of these is £212,000,000. These are figures, I may say, of the net registered tonnage, because I observe in some of the papers in the Inquiry which preceded this Inquiry, you often had the figures of gross tonnage, but the registered tonnage is a great deal less, and, of course, rather more valuable. Then the last item of all (8), is an estimate of the value of cargoes in British ships trading between foreign countries, or between foreign countries and British possessions, which I have roughly put down at 600 millions, not without looking into the matter a little, and making a rough statement in my own mind for different countries as to what this would be made up of; but it would have taken me a great deal of time, without any clerical assistance, to make up a special statement. It can easily be checked if you look into it. The figures would have been rather larger if it had been possible to get them throughout for the whole year, 1906. I should like to remark upon one or two of the items with regard to the coasting trade, that, although there are no official figures of exports and imports, *eo nomine*, there is known to be a large amount of trade between Ireland and Great Britain, which cannot be less, I believe, than 50 millions annually. I understand that within the last year or two there has been some return as to the trade between Ireland and Great Britain, fully confirming this, but I have not seen it, and am not able to refer to it. But the figure of 50 millions is one which I obtained about the year 1886, after a great many actual calculations, and looking into the individual port returns of trade between Ireland and Great Britain. There is also a vast trade in coal by sea between different parts of the United Kingdom, no less than 20 million tons being shipped coastwise. That is an actual figure, which we have from official returns. There is equally known to be a large distribution of tea, sugar, and other articles by coasting steamers from London.

2973. Is that a trade between London and other parts of England, or between London and Ireland?—Between London and other parts of England; and Scotland and Ireland also.

2974. But not confined to Ireland?—No, not at all, This is actual coasting trade, a large amount of trade, especially on the east coast, which I know about. There is also coasting business between Liverpool and Glasgow, Liverpool and South Wales, and so on. I should say that the estimate of 100 millions for the whole coasting trade, the coasting trade of Great Britain and the coasting trade between Great Britain and Ireland, is probably much under the mark. Then I should like to make a remark upon the item of the value of ships, in reference to one of the sub-items.

2975. Before you come to that, may I ask about the item of £12,000,000 for the produce of sea fisheries?—That is an actual figure. That is an actual return issued by the Board of Trade of the quantity and value of the sea fisheries of the United Kingdom, and I think you will find that £12,000,000 is about the mark in the last year or so.

2976. Then will you return to item 7, the value of ships, as you wish?—The sub-item for bunker coal and provisions, appears to be justified as a proper addition to the value of the ships, whatever may be the exact figure put upon it. It is the constant practice of shipowners, I understand, to insure freight, which is justified by the fact of actual outlay incurred in earning the freight. Nearly 20 million tons of bunker coals are annually put on board in English ports alone.

2977. If I understand you rightly, you consider that for our purpose those bunker coals should be treated in the same manner as freight?—If you put in the freight as a separate item, then you ought not to have the bunker coal. The bunker coal and provisions are part of the expenditure of a shipowner in earning the freight. If you have a separate estimate of the freight, then you may omit the bunker coal and provisions. It is a different mode of stating it.

2978. I understand. It is an alternative?—Yes.

2979. Not an addition?—No. Then the last item of all, the value of cargoes in British ships between foreign countries, or between foreign countries and British possessions—that is, the whole carrying trade of the world, exclusive of that to and from the United Kingdom—is, of course, a conjecture; but the figure must be very large, so large a part of the foreign trade in question being known to be conveyed in British ships, and I think I may say on account of British merchants. The return "Progress of British Merchant Shipping," contains tables showing how large a part of the business of importing and exporting of the principal foreign countries is done by British shipping. This, of course, includes the trade of those countries with the United Kingdom, which has already been dealt with; but no country trades with the United Kingdom exclusively, and British ships are employed indiscriminately in all trades. The figures, for instance, would include the trade between India and the United States, or between India and Germany, or between India and France, or between South America and the United States, or between South America and Germany and France, and so on. There is an immense trade exclusive of the trade which is carried on between foreign countries and British Possessions and the United Kingdom.

2980. In any great war, certainly in any war with a European Power, therefore, some portion of that trade must be abated?—Because exposed to the risk of capture.

2981. And some portion of it must cease at the outbreak of war, because it is a trade carried on with the enemy?—That would be so, and that is a point which I should think ought to be considered very much on the outbreak of war, that all your figures would be changed in a moment on account of the cessation of trade with one side or the other.

2982. (*Sir George Murray.*) That would affect item 1 probably more than 8?—That is the imports and exports?

2983. Yes?—One could hardly say how far our imports and exports would be affected; but, of course, we should hope it would affect the enemy much more than it does ourselves. But I think I have some remarks to make later on as to the cessation of trade on account of the stoppage of business with the enemy himself, which is a very large matter. The statement is also liable to the observation that a portion of our own imports and exports is conveyed in foreign ships. The proportions of shipping entries and clearances in the United Kingdom are: Total entries of ships, 56 million tons, of which the British proportion is 35 million tons, or 63 per cent.; and the foreign, 20 million tons, or 37 per cent. But whether the trade itself is British and foreign in the same proportions may be doubted, though some correction might have to be made in an exact account. It is quite possible, for instance, that a large part of these entries consists of the short voyages between the United Kingdom and European countries, and does not represent a large amount of shipping trade, and may include the calling merely of vessels to and from, say, Dover and Calais,

which would give you a large amount of entries annually, but without much cargo being concerned.

2984. (*Sir James Mackay.*) It would also give the Hamburg-American Line calling at Southampton on the way to Hamburg from America?—Yes.

2985. (*Mr. Llewellyn Smith.*) I think those German steamers that Sir James Mackay mentions, that call at Southampton for mail purposes, are not in fact entered?—You might have a ship coming into harbour without actually being entered. On the other hand, I think there is a great difficulty at some of the ports, especially at Southampton.

2986. (*Sir James Mackay.*) But the Hamburg-American steamers calling at Southampton on the way to Hamburg are entered?—If they land passengers and cargo.

2987. (*Mr. Llewellyn Smith.*) But there is an anomaly there. A great many of those German liners, as a matter of fact, are not entered?—No.

2988. (*Sir George Clarke.*) But if they are entered they swell the tonnage entry, and it is not trade at all?—That is so

2989. If these ships are constantly registered as coming in and out, it would vitiate all the returns as to the tonnage entering our ports. You have a great ship coming in, going out, and coming in again, all registered as so much tonnage of shipping entering. That would make that return illusory, would it not?—That applies, I think, to the shipping trade more now than it used to do, because we have a great many mail steamers coming and going, which must go at certain dates, whether with cargo and passengers or not. This point is to be kept in mind, though there can be no exact figures. An exactly proportionate correction would reduce the above 1,345 millions of imports and exports altogether, including bullion and specie, to 850 millions, or thereabouts. I assume in any case the correction is much more than set off by the trade between foreign countries and between foreign countries and British possessions carried on in British ships. Then, before leaving these figures, I should like to add that the figures for shipping are those with the United Kingdom only, and do not include the shipping of British Possessions, which would add two or three millions, I think, to the total; also that I have not included the value of securities carried by ships, although that is frequently, especially in the trade with the United States, a very important part of the cargo. I think I was asked some questions about that in 1879, some importance being attached to the point, and no doubt it is a very material point, because securities would be a part of a cargo which, in capturing or sinking a ship, an enemy would take away easily.

2990. (*Sir James Mackay.*) Have you included the coasting trade of India and the Straits Settlements? Have you thought of the value of it?—That would be included under the last item of all.

2991. That is a very big item?—No doubt that is a very large item; or between India and China. You have a large trade of that kind.

2992. Yes, and also you have a very large British trade on the coast of China?—And we have a large British trade in doing the coasting trade of China itself. The last remark I have to make upon that is that the figures I have given are for a year. I have taken the imports and exports, and all these other figures, for a year, and then, of course, I take the shipping merely at one date, because it does not change throughout the year; you have the same amount of shipping. If a shorter period were to be taken, say, three months, the trade figures would be reduced. If three months, they would be a fourth, or thereabouts, of those stated. But the shipping figures would remain the same. The aggregate for three months might still come to about 600 millions to 700 millions; that is exports and imports for three months, and the other items plus the same amount of shipping. Whether you take it for a year or three months, it is the same amount.

2993. (*Chairman.*) What you have said so far brings you to the cost of a universal indemnity?—That is the point with which I proceed next. To give a universal indemnity against capture, if the figures are at all near the mark, would mean that 1 per cent. of captures in a year would run to an indemnity of £20,000,000; 2 per cent., £40,000,000; 5 per cent., £100,000,000, and so on. Even ½ per cent. of captures would be £10,000,000 sterling. In three months, or other short periods, the figures must still be large. 1 per cent. of captures in three months would be £6,000,000; 2 per cent., £12,000,000; 5 per cent., £30,000,000, all of them large figures. Even a small charge for insurance, if quite general, would be a considerable sum.

2994. (*Sir George Clarke.*) Do those figures include the cargoes and the values of the ships captured?—Yes; there is the value of the ship once stated, and then the proportionate amount of the cargo for three months compared with the figure I have given for twelve months.

2995. (*Sir James Mackay.*) Have you formed an estimate of what the value of ships and cargo and bullion at sea at any one time would be at risk?—I have at different times.

2996. It is rather an important point, is it not? Suppose war broke out, what would be the value of the cargo and shipping at sea?—About a third or fourth of the value would be afloat at one time. But it is no use giving a general figure, because it would differ in every trade. For instance, the amount afloat at one time in the trade between England and the Continent is very small in proportion to the total trade. The amount afloat at one time in our trade with India and Australia is very large in proportion to the total trade. You would require to do it by different trades, I should imagine.

2997. It would be rather difficult to work out?—Extremely difficult to work out, but it must be a very large figure. We do know that.

2998. (*Chairman.*) It depends upon the length of the route, and upon the time taken upon a particular voyage, does it?—And upon the nature of the cargo. I think that is a very material part. The cargoes, for instance, that come from Australia are extremely valuable; the cargoes that come from other parts are not always so valuable. Then the outgoing cargoes to Australia and India, for instance, are extremely valuable. I do not know that they are so valuable to many other parts of the world.

2999. But how does the question of their value affect the proportion of the year's trade which is at risk at any one moment?—That would require to be gone into if you were making an estimate of the risk at any one moment. I merely made a sort of rough guess as to what it must be. We know that it cannot exceed a certain limit, and cannot go below certain limits.

3000. (*Sir George Clarke.*) And it would vary at different times of the year?—It would vary a good deal at different times of the year, but the principal item, shipping, would not, I think, vary so much. Shipping is almost always at sea.

3001. (*Sir James Mackay.*) If you took the trade across the North Sea, where it is only a night's run, you would have to divide that by about 365, would you not, to ascertain the value?—That would be so. To take the trade across the English Channel, I believe you get two voyages in a day, out and in, perhaps three.

3002. You would divide by 365, or perhaps by 700?—Yes.

3003. Whereas the trade to India you would probably divide by three or four?—That, again, would depend. You have not such a long voyage to Bombay as to Calcutta.

3004. It would be a very difficult problem to work out?—Yes. The next point I have to make is that the indemnity would have to be paid at a time when the country would necessarily be subject to heavy taxation, and while heavy losses in all directions were being incurred. This appears to be one of the most important considerations affecting any plan. We cannot contemplate our commerce being exposed to risk of capture, as if that could be considered by itself and provision made against it and its direct and indirect consequences. The whole situation must be faced. My opinion is that in a great maritime war there would be danger of financial and banking panics, with their attendant losses. This would arise in several ways. First of all, by the non-intercourse with the enemy, which had been an important customer up to the outbreak of war. Take, for instance, the United States. Apart from military and naval operations, non-intercourse with the United States would involve interruption of supplies of food, cotton, copper, silver, leather

Sir R. Giffen, K.C.B., F.R.S.

28 May 1907.

and other commodities, and largely diminish our export trade. It is impossible to conceive of such a state of things without danger to the entire fabric of our credit. Apart from this result of non-intercourse, a state of war would involve, at first at least, large gold withdrawals from London. This has happened in many former wars whether we were directly involved or not. For instance, the Polish war of 1831-2, the Revolution of 1848, the Crimean War, the American Civil War, the Austro-Prussian War of 1865, which was partly the occasion of the Overend panic of that year, the panic at the outbreak of the war of 1870 between France and Germany, the Russo-Turkish War of 1877, and to some extent the Russo-Japanese War. Looking at the circumsances, which determine banking panics, and the former experiences causing gold withdrawals, I should say that the first disastrous effect of a war between this country and a first-class Power like Germany or the United States, might not improbably be a panic of unprecedented dimensions and the suspension of specie payments as in 1797. I may mention in this connection that the United States suspended specie payments in 1861 and 1862, and France suspended specie payments and enacted moratorium for bills in the war of 1870.

3005. (*Chairman.*) Do you draw any distinction in this matter between a war in which we are a party and a war in which we are not directly concerned?—I think a war in which we were directly concerned would be infinitely more serious. At present the fact of our being neutral has mitigated, to some extent, the panic and other consequences of the outbreak of war between foreign countries. I would instance, especially, the Civil War in the United States between 1861 and 1865, and the war between France and Germany in 1870 and 1871. The fact that we were neutral, although there was great commotion and excitement at first, rather mitigated the effect of these events upon the money markets of the world; London being a great centre to which money in the course of time could be sent for safety. But what the result would be when we were ourselves engaged in a great war is not so easy to foretell. We might not have money coming to London in the same way for security as money has come in former wars in which we were not engaged.

3006. (*Mr. Huth Jackson.*) Did you include the Boer War in your statement?—I have not mentioned the Boer War, because it really was so small in proportion to the total business of this country that there was very little excitement about it by comparison.

3007. Still, from the financial point of view, it was important, was it not, because we had to raise large sums of money?—I think large sums of money did go from this country, especially to South Africa, but there was not a panic.

3008. On balance, do you think gold went out of the country in consequence of the war?—On balance, yes.

3009. (*Sir George Clarke.*) But was not the absence of panic due to the ignorance of the magnitude of the task which we were undertaking?—It was not like the actual panic that caused such large gold withdrawals in the war of 1870.

3010. (*Chairman.*) Take that case in 1870. Where did the gold go to that was withdrawn?—It went to the continent, to Belgium and Holland, and partly to France. You will find it very well explained in Bagehot's "Lombard Street." The first act of the bankers was to protect themselves and to call in the money, and a good deal of the money being in London it was called in from London. That caused a great apprehension, and the result was one of the biggest panics on the Stock Exchange which the Stock Exchange has ever known, I believe, in the first week of July, 1870. But immediately after, when things began to quiet down, the same bankers who had withdrawn their money suddenly to protect themselves against immediate demands of which they were apprehensive, sent back the money to Lombard Street, and Lombard Street was choked up with money while the war between France and Germany was going on. But the two things are not inconsistent, the first sudden demand when there is a breath of difficulty, and the banker thinks he may have to meet immediate engagements, and the subsequent sending of money to London for safe security, London being in a neutral state, and not engaged in the war.

3011. I gather that you consider that we are more exposed to panics of that kind than are the other Great Powers?—I should not like to say that we are more exposed. Other Powers seem to have made great preparations, and have large reserves of cash, and have not the same development of credit that we have. But the panics in Paris and in Germany have been very severe indeed. I recollect very well in 1873 you had panics all over the Continent, in Vienna, in Berlin, in Frankfort, and in Paris, quite as severe, if not more severe, than anything we had at that time.

3012. But was there a similar panic in Berlin at the outbreak of the war in 1870?—Undoubtedly one of the causes of the panic in London was the panic in the continental centres, and their consequently taking money from London.

3013. Then the danger to us arises from the fact that we have so much foreign money here in ordinary times?—That is one of the reasons; the foreign moneys are placed in bills drawn upon London, and, of course, the foreign banker can take that money at any time.

3014. You say that the presence of so much foreign money here in ordinary times is one of the causes of danger to us. Are there any other causes which are special to us and do not equally apply to any other Great Power going to war?—I think the custom of foreign countries coming so freely to London is one peculiar to London. There is no other market to which they are accustomed to go for immediate cash as they are accustomed to go to London.

3015. There is no other market in which they can get it, I believe?—I do not say that no other market is available, but there is no other market to which they are accustomed to go.

3016. (*Sir James Mackay.*) It is the only market where they can make sure of getting gold, is it not?—Practically that is so. Both in Paris and in Berlin nominally you can get gold, but it is not quite so easy to get it freely. I think when I made that statement I had also in view that foreign bankers with credit in London have a certain power of taking money from London apart from the actual cash they have on deposit. It is a question of credit to some extent, and a foreign banker in good credit might have means of taking money from London although he had no actual cash there, or had not cash equal to what he proposed to take. The sale of securities and other methods would put him in funds.

3017. (*Chairman.*) But that means would be far less open to him in a time of stringency or panic?—It would be the attempts of the foreign banker to get the money that would cause the stringency to a large extent.

3018. Will you proceed with your statement?—The next statement I make is that as the result of these panics there would immediately be great distress and want of employment at the outbreak of war, leading to the ruin of many traders in all trades. What happened in Lancashire in 1862-66 owing to the famine of cotton alone, would be all but universal throughout the country.

3019. I do not quite follow why that should be so?—Because if you have a shortage, not merely of cotton but of other articles, owing to the stoppage of intercourse with the enemy, you have immediately the same kind of stoppage of employment that you had in Lancashire in 1862-66, and not merely in cotton but in wool and numerous other articles, copper, iron, and so on.

3020. You are thinking especially of the United States at the present time, are you not?—That was one of the countries, but I have thought also of other countries in this connection, and the stoppage of employment would be even more direct in some cases. For instance, if we were at war with Germany, there would be a cessation of the export of about, I think, seven million to ten million tons of coal from this country to Germany, and seven to ten million tons of coal implies a very considerable employment of labour. There would also be a stoppage of other things as well, because Germany is a customer of this country for about between £30,000,000 and £40,000,000 sterling of goods.

3021. Is there any other country but the United States, war with which would seriously affect our supply of raw materials?—I think not. There is no other country singly supplying us with raw materials quite to the same extent as the United States.

3022. In the case of the United States the distress

would arise from our inability to buy our food or our raw materials; in the case of the other countries it would arise from our inability to sell or produce to the extent we had previously done?—To a large extent from the inability to sell. But we obtain our raw materials and food from a very wide area, and you would require to consider very carefully how much in each case you would be immediately affected by the stoppage of intercourse.

3023. But the loss of market for sales would be to some extent compensated, would it not, by the immediate increased demand of our own Government?—You might think so as regards such an item as coal perhaps, and yet I do not feel quite sure about it. You might have a large stoppage of your export trade which no amount of Government demand would supply.

3024. Have you looked at our export trade with any particular continental nation from that point of view, comparing the extent of trade that would be stopped with the increased demand that was caused, for instance, by the Boer War?—Not from that point of view, and not with any estimate of what increased demand there would be in other directions. Such an inquiry I should consider rather speculative, because when you come to practice, when you come to such things as war, a great deal that is quite unexpected always happens.

3025. Speaking generally, a time of war has generally meant a large demand and a profitable demand, has it not?—I think merely for certain things on account of the Government. I should rather be inclined to say not; that a time of war very often means a stoppage of business in various directions. For instance, there is that case I have given of the United States and the cotton famine. That was an extreme illustration of the effect of war in actually stopping business.

3026. That was rather a peculiar case, was it not? We drew the whole of our supplies of the raw material from one particular quarter of the world, and that quarter was the theatre of the war?—That was so, but just to show the difference of what happens, we drew a large amount of our food at the same time from the United States, but as a matter of fact at the very time that cotton was so dear and scarce you had wheat cheaper than it was at any time, I think, in the course of last century. Wheat was under 40s. a quarter for two or three years in 1862-66, at the very time of the cotton famine, although our supply of wheat came very largely from the country which was the theatre of war.

3027. But not from those parts of the country which were the theatre of war?—That was so. You require to go into it in so much detail.

3028. But my point was a little different. What I was suggesting to you was that it is almost impossible to conceive of the situation that arose in regard to cotton during the American war being repeated in regard to that or any other article in any case in which we were at war, except a war with the United States?—I think you might have something like it in regard to wool. If you had a combination of a short crop in Australia with a war in South America—in the Argentine, for instance, you would have a famine of wool very nearly resembling the famine of cotton that you had during the time of the American Civil War.

3029. (*Mr. Gladstone.*) Except that wool might be obtained from other countries, whereas we know that cotton in the sixties came altogether from America?—One result of the cotton famine, as we know, was the great boom in India. It created a great demand for Indian cotton.

3030. Indian cotton at that time was a mere nothing?—It was a very great matter for India. One of the greatest economic events we had was the rise in cotton in India, and the great prosperity in Bombay and other places. Another consequence of the cotton famine, which took a little time to operate, was that immediately you had an increased demand for wool and linen and silk.

3031. (*Mr. Huth Jackson.*) Is not there now a much greater interchange between those articles than there used to be. Would not the deficiency in the case of supplies of cotton be made up to a great extent by an increased use of wool?—I should hope it might be, and there would be more mixture in the spinning and the weaving, I believe, but how far one could follow that out as to what the result would be in a particular war is not so easy.

Sir R. Giffen K.C.B., F.R.S.
28 May 1907.

3032. (*Chairman.*) Whatever be the exact limits, you are, at any rate, of opinion that there would be great distress and great want of employment following on the outbreak of war?—I have no doubt there would be great distress and want of employment, and, apart from these points we have been mentioning, if you had, for instance, any large banking failures and things of that kind that would immediately produce great distress in the districts where the banks failed.

3033. Will you proceed with your statement?—The conclusion I come to, then, is that a measure of indemnity against the capture of ships and cargoes, so as to facilitate the trade, might thus cost a great deal of money at the very time when everybody was in poverty. Even if assented to on account of the advantages promised, there would be much grumbling by those who had to pay. I have to suggest that a measure of universal indemnity ought not to be lightly adopted, for obvious reasons of cost, because the country would be undergoing an excessive financial strain at the very time. I think, however, that an indemnity in certain cases and on strict conditions would not be open to the same objections, and would, at least, be more manageable. Areas and routes of trade are of varying importance, and there is not an equal necessity to keep all open. There may be some outlying routes of trade which we might as well let go as endeavour to protect at a greater cost than they are worth—the trade, for instance, on the north-west coast of America. In other cases, a question of indemnity might not arise, owing to the safety of the route being absolutely assured—for instance, between Dover and Calais, or Liverpool and Belfast, or the Red Sea, or the Mediterranean. An indemnity ought not to be given on such a route, where there can be no medium between the certainty of capture at one time and absolute safety at another.

3034. I do not think I quite follow that statement?—For instance, between Dover and Calais, if there was an enemy's cruiser outside, I should hope that no ship would venture out to run straight into the jaws of the enemy. If, however, it was known quite for certain in Dover that there was no enemy's cruiser outside it would be a case of absolute safety to make the voyage from Dover to Calais. In either case there is no room for indemnity; it does not arise.

3035. There is no objection to the indemnity in the second case. If there is no danger the State incurs no risk?—Nobody would want it.

3036. It would merely be unnecessary?—Yes.

3037. In any given war that would probably apply to a good deal of the commerce which you have included in your statement of the value at risk?—Especially to the cargoes. I am not so sure about the shipping. I think so large a part of the shipping is in the more distant trades that you may consider that the shipping is rather more exposed to capture than the commerce.

3038. At any rate, there would be a considerable proportion of the total figure which you gave us which would practically not be a real risk. What that proportion would be would differ with each individual war?—It would differ with the particular war.

3039. But there would be a considerable proportion in any war, even in a war which threatened us most?—I should hope there would be.

3040. Then there comes the case of the ships which ought not to be allowed to leave because the danger is too great and the loss is practically a certainty. Would not that be met by placing an obligation on shipowners desirous of availing themselves of the indemnity to follow any instructions issued by the Admiralty?—I should hope that would be so, with this remark about it, that the giving of instructions by the Admiralty would cause delays and many other difficulties, and would be a practical method of denying the indemnity altogether very often.

3041. No doubt the power to deny the indemnity—that is to say, to refuse to sanction a voyage—must be reserved to the Government?—And also you must bear this in mind: How are you to make the application, for instance, in a voyage from Dover to Calais? We will say an enemy's cruiser is there in the forenoon; a British cruiser comes up and sends it away, and a voyage which was dangerous in the morning is safe in the afternoon. How are you to go through the formalities of asking the sanction of the Admiralty and matters of that kind in a case like that? No doubt there might be general instructions and general regu-

Sir R. Giffen, K.C.B., F.R.S.

28 May 1907.

lations, but it would be a very difficult matter to arrange, and probably the safest plan would be for the shipowner not to wait for the sanction of the Admiralty or anything. He would go for the voyage if it was safe, but if you promise him payment for the voyage if the ship were captured he would probably go for the voyage if it was not safe, because whatever the Admiralty directions were it would not prevent them being misunderstood in some cases, and the loss would occur.

3042. But you were just suggesting we might have a restricted indemnity?—That would be a restricted indemnity, and that, I think, you would find would apply to cases totally unlike the case of Dover and Calais, or those narrow places where capture is either a dead certainty or an impossibility.

3043. Of course, you recognise that under your scheme of indemnity there must be some restrictions laid down by the Admiralty or other Government Authority?—It is hardly a scheme that I suggest. It is a sort of limitation, with some reservation that this sort of thing might be tried. But I am not very much in favour of it at all.

3044. At any rate, if it were to be tried you would confine the indemnity to certain routes which had the sanction of the Admiralty, and where the necessary precautions against capture were adopted?—That would be so, and then possibly the expedient of convoys might again be practicable, but that is so purely an Admiralty question that I can express no opinion upon it. Then my hope would be that after a time during a war the subject would settle itself. A certain number of areas and routes, perhaps the most important, would be absolutely safe either at once or very soon; there would be relative safety on others, where shipowners and merchants might be encouraged by the promise of indemnity; certain outlying routes would be neglected or left to the adventurous. An indemnity thus limited need not be impracticable on account of the expense, but whether the shipowners would care for it or not is a different question. Then I think it would be reasonable that persons wishing to be indemnified should pay a small contribution, partly as a restraint upon unreasonable ventures, and partly because those receiving the indemnity obtain a special advantage as compared with the rest of the community, which is equally suffering losses. Convoys, I believe, were paid for by the trade.

3045. How do you propose that the payment of this contribution should act as a restraint upon unreasonable ventures? Do you intend that the contribution should bear any proportion to the risk?—Not at all, but it should be quite sufficient to make a shipowner consider seriously whether it would not be better for him to do without it, or trust to his ordinary insurance.

3046. If it is higher than he can insure in the market of course he would prefer to go to his ordinary insurance?—That is so. It should be such a figure as would prevent excessive premiums, but not such a figure as to make it too easy for the shipowner or the merchant.

3047. But on one of the journeys you are contemplating, one of the very risky voyages, the figure must be very high, must it not, if it bears any kind of relation to the risk? It may be 50 guineas per cent., it may be even higher?—I should imagine that the Admiralty would not encourage ships to go at 50 guineas per cent. When it comes to so high a figure as that clearly a convoy is the proper arrangement. It comes cheaper. Then you might have another thing in use in time of war, which you have had on former occasions. Ships of war might carry a valuable cargo, for instance, silver and gold and securities and other things. I believe that until a recent period it was lawful for His Majesty's ships to carry silver, and they have brought home silver from South America, not in time of war even, but in time of peace.

3048. Practically when the risk rose to a high figure you would say the voyage had better not be undertaken?—Or it is a question for the Admiralty to consider whether it would not be cheaper to provide convoys.

3049. Then will you finish your statement?—The last point I have to make is that power might be given by a general Act of Parliament to the Privy Council to issue an Order authorising the Treasury to pay indemnities on capture of ships and cargoes, subject to conditions as to conforming to Admiralty rules and regulations, and Treasury rules and regulations, either stated in the Order or to be issued in further pursuance thereof. Probably an Order in Council would always be necessary to give effect to rules and regulations of the Treasury and Admiralty.

3050. I gather from what you said just now that on the whole you do not press these suggestions much upon us?—Not very much, because I am not sure that on the whole there ought to be a national indemnity. I am not much in favour of the idea generally.

3051. Supposing there is no indemnity, what do you anticipate would happen on the outbreak of war to our mercantile marine? Would it succeed in obtaining continuous employment under the British flag, or would you anticipate that a large number of ships would be laid up, either because the risks were too great, or (which is, perhaps, another way of saying the same thing) because the rates they had to pay, and, therefore, to charge, were so great that they were, therefore, unable to obtain freights?—My opinion is, on the whole, that employment would continue, and that shipowners and merchants would take all the risks incidental to the business. If there was a necessity for higher premiums there would be freights corresponding, and they would be able to afford the risk. I believe there would be no cessation of the British flag from the seas at all in almost any conceivable war. Of course, if we should be defeated at sea a different situation would arise altogether. Then one hardly knows what would happen. We should be utterly smashed up, I suppose, and we should not be considering questions of this kind.

3052. No; we assume that the British fleet maintains its supremacy for the purpose of our inquiry?—If that is the condition, my general feeling is that there need be no apprehension as to the British mercantile flag keeping the sea, and finding very full employment indeed. I think I was asked some questions on that point in 1879, with reference to the possibility of the transfer of ships to neutral flags.

3053. I was just going to put that to you?—And I gave the opinion in 1879 that I thought the transfer would have to be on such an enormous scale that there is no conceivable possibility of it. I have thought a good deal of the question at different times since then, and I believe that as far as the transfer to neutral flags is concerned there are hardly any neutral flags to which the ships could be transferred, not owing to our regulations, but owing to the regulations of most foreign countries. For instance, as the legislation in the United States at present stands, no British ship could be transferred to the United States flag.

3054. But that is a matter of domestic regulation, which those foreign Powers could alter at any time if they thought it to their advantage to do so?—I think you would find it would be impossible for them to alter it after war had broken out, to enable them to take the ships of one of the belligerents. The other belligerent would very probably consider all such transfers colourable, and act accordingly.

3055. Might not the other belligerent consider that it was undesirable to come into conflict, say, with the United States in addition to the United Kingdom, and that the United Kingdom was sufficiently injured if she lost her mercantile marine, if it passed to the American flag?—That would be so if it were a case of transfer to the United States. But I think we must take the trend of legislation in most countries as it actually is, and assume that there could be no transfers to the neutral flag of the United States, if the United States were a neutral.

3056. Apart from the legal difficulty raised by domestic legislation, it would be a much easier operation in these days, would it not, than, for instance, when you considered the thing in 1879? I mean that the accumulation of enormous capitals under a single management is a thing with which we are much more familiar now than we were 30 years ago, and it is much more possible now to carry out a big operation of that kind financially?—As far as capital is concerned that is quite certain, but I am looking at mechanical difficulties in the way of the thing, where your transfers have to be legally recorded, and how they are to be effected, and matters of that kind. It might take a long time to make the transfers on particular ships.

3057. I pass from shipping to the effect of war on our trade generally. Am I right in supposing that your view is that the disturbance will be so great and so serious that the mere rise in freights due to war

risks will be a practically negligible quantity, or, at any rate, that to deal with them and them alone would be a mere drop in the bucket?—That is my feeling, that it is not big enough by itself, compared with all the other direct and indirect consequences of a state of war such as we contemplate.

3058. And therefore you hold that the grant of a State indemnity would not have any great effect upon the continuance of our trade or upon the prices of our supplies of food and raw materials?—I think not. I think there is a little misapprehension about the question of prices, because there is no doubt that, although the stoppage of supplies, such as cotton, did cause a remarkable rise in price of that particular article, it does not appear to be the case that a state of war would lead to a general rise in prices. It leads to a rise of prices in particular articles, according to particular circumstances, which require to be very carefully considered. But, on the whole, a state of war might lead to forced sales and things of that kind that would cause a general fall of prices instead. For instance, take the case of the United States again; the result might be an abundance of certain articles owing to the United States supply to this country being stopped. They would try to sell their articles in other markets, and cause a fall of prices in those markets by which we should benefit. I see no cause for a general rise of prices in consequence of war.

3059. Take the case of wheat, in particular. Suppose our direct supplies from the United States ceased because we were at war with the United States, that would also be the circumstance under which our supplies from Canada would be the most exposed to danger, I suppose. Do you anticipate that those supplies would reach us indirectly if they did not reach us directly?—Either supplies from the United States or from some other countries. The United States, for instance, if it could not send wheat to this country, would be in great difficulty; the merchants and farmers in the United States would want a market very badly. Then they would send their wheat to France and to Germany and to other European countries. The price of wheat in those countries would fall accordingly, and we would have wheat from them to some extent. I mean there must be a limit to the rise of prices.

3060. (*Sir George Murray.*) Supposing, as you anticipate, a great war was accompanied by serious financial complication or even a panic, do you think our national difficulties would be very much increased under a system of indemnity as compared with a system under which the losses were covered by insurance as they are now?—What I should rather anticipate would be that in the time of panic we would not be thinking of indemnity at all. The question would be whether anybody could live through, and also, when it comes to a question of suspending specie payments, what would you pay the indemnity in?

3061. Whatever the current medium would be at the time, I suppose?—It is so much a larger question to consider than what would happen to the question of indemnity. That was the point I desired to make.

3062. But would not the fear of capture be the dominant element in the financial crisis that you contemplate?—Yes, that would be so.

3063. Then it would be a serious factor in the whole situation, and, after all, should we be any worse off, do you think, with a system of indemnity in force than without it?—The fear of capture would aggravate the feeling about the danger of supplies. But, in addition to that, the financial panic would probably impoverish every one to a very large extent.

3064. So would the losses if they occurred, I suppose?—Yes. I mean a man who was suffering from the failure of his bank would not have any great feeling of compassion for a shipowner who was suffering from the capture of his ship. They would be in much the same condition.

3065. Still, the shipowner and the cargo owner would not have to suffer unless there were some means of recouping their losses?—But then they would recoup their losses probably in the course of business. The freights and other things must adjust themselves to the condition of affairs.

3066. And that would increase your financial complication, would it not?—I do not know that it would increase it very much, because when it comes to the case of the stoppage of banks, there can be no more serious complication conceivable, I imagine, because that stops employment so largely, and it is so inconvenient to everyone who suffers the loss, that you cannot have a worse state of things.

Sir R. Giffen, K.C.B., F.R.S.

28 May 1907.

3067. Would you be more likely to have a stoppage of banks with the system of indemnity than without it?—I do not think the indemnity would make much difference, because it would probably come like an earthquake, without much warning. You would wake up some fine day and find that the bank could not cash your cheques. That would be a thing that would happen.

3068. (*Mr. Llewllyn Smith.*) With regard to the question which I interposed when Sir James Mackay was asking you about the Hamburg-American vessels, I have inquired at the Board of Trade, and I find that the facts are these: Such vessels, if they only land or embark passengers, would be included if they land or embark them at the docks or quays of Southampton or in the immediate vicinity thereof, but vessels that merely transfer passengers to or from tenders are not included, and so far as the statistics show, all the big German liners come into the second category, and therefore they are not included. That would also apply to Plymouth and Dover?—I should like to say with reference to that that you have a large number of cases of big liners coming into places like Southampton that do come to the docks and quays.

3069. Undoubtedly. I rather gather that you do not think that a case has been made out, so far as you know, for State action in the nature of an indemnity. You are rather against the whole thing?—My general feeling is that it is a case for the Admiralty so much that we are rather in the dark about discussing it outside. They ought to know what they will do and what they can do, as nobody else can, and they can make their arrangements accordingly.

3070. Would you anticipate that just at the outbreak of war there would be a large rise of prices due to apprehensions of captures which would be out of all proportion to the number of captures that would actually be made?—Merely in certain directions. I should say that in many other directions you would have a great fall in prices. For instance, on the Stock Exchange you would have a great tumble in prices on the outbreak of war.

3071. Prices of securities?—That is a very large element in prices, and that would apply to all cases where stocks of articles are held with borrowed money. You might have a great tumble in prices. Of course, you might have a rise in other things where the war circumstances specially favoured a rise, but the general circumstances of panic would rather favour a fall of prices.

3072. You think that in the long run the shipowner will be able to recoup himself by an extra charge of freight?—He must either recoup himself or go out of the business, clearly.

3073. But it has been suggested that that would not apply to the vessels afloat at the actual outbreak of war. Would you think there would be a special case for indemnity for such vessels?—How far that would be a special case one can hardly say in these days of telegraphy, because shipowners would have so much notice as well as other people. Unless in a very rare and extreme case you would find that there were war premiums in existence for some time before the actual outbreak of war, just as there were at the time of the Fashoda scare. You had very considerable war premiums charged in the City then, and not merely for a short time but for a considerable time war premiums were paid; very much, I suppose, in that case, to the advantage of the underwriter, because the war did not come off.

3074. (*Sir George Clarke.*) Have we any means of ascertaining at any time how much foreign money is held on call in London, the money which you have said might be suddenly withdrawn from us if we went to war?—I have never put together figures of that kind myself, because one remembers that Mr. Huth Jackson, one of your members, has done it, in my opinion, so very well, and he can give you all the information necessary.

3075. You think it is impossible to form an approximate estimate of the gold we might lose?—I should not like to form an estimate of the amount of foreign money on call at any time.

Sir R. Giffen, K.C.B., F.R.S

28 May 1907.

3076. I believe your view is that prices do not rise necessarily in time of war unless the production of the particular article is stopped?—That is strongly my opinion.

3077. And if the production of the particular thing we want is going on in time of war, that article will come to us even if it comes indirectly from the belligerent?—It would tend to come to us under very different circumstances.

3078. And you still maintain your view that the transfer of British ships to foreign flags at the outset or during war is not probable on a very large scale?—I think there ought to be no apprehension of it; that is to say, not to any Great Power that would be afterwards a competitor with us in marine trade. There might be a transfer of ships to neutral flags under weak Powers, but not a transfer to any considerable Power, partly because there are no arrangements at present for such a Power to accept the transfers.

3079. Then, if that transfer could not take place, the vessels of neutrals would not be able to carry on their own trade and absorb a portion of ours?—It would be impossible for the business of carrying all over the world to go on without the British flag.

3080. Therefore that carrying trade must stop in war unless the British flag continues to do it to a great extent?—That is so.

3081. I suppose you think the percentage of losses we should incur would depend principally upon the naval position of the country we were at war with?—At the time.

3082. You mean that nothing like a general law could be established; it would depend entirely on the Powers we were at war with?—Entirely.

3083. And it would depend very much upon the measures of previous preparation made by the Admiralty?—It is so much a question between the Admiralty and the enemy that outsiders like myself can express no opinion upon it, I believe.

3084. Our risk of loss would be very much less if the Admiralty had a completely thought-out system for guarding commerce in the event of a particular war?—My feeling is that the Admiralty may be too much under the impression that what they have got to do is to beat the enemy, but the other element of preventing certain evil consequences from the war is also very important, and ought not to be lost sight of. I will give an illustration. I believe it is an opinion that military men have expressed at various times that the garrison of Ireland need not be more than 10,000 men, that you could guarantee to keep Ireland quiet and keep an insurrection down with 10,000 men. As a matter of fact you have always about 30,000, and you find that when Mr. Childers was Minister of War he was very anxious about it, not merely that he thought a less number might not be sufficient, but that he wished to avert the necessity of having any bloodshed or any trouble whatsoever; he considered that was very important, as well as the actual maintenance of the supremacy of the British authorities. Clearly there are two elements always to be considered, not merely what is sufficient to beat the enemy, as it were, but what is sufficient to prevent certain incidental consequences which you wish to avert. That applies very much to the preparation of this country for a maritime war.

3085. Then you mean that, apart from the idea of fighting the enemy's fleet, special and particular arrangements ought to be made for guarding trade in particular parts of the world?—That is the general opinion I have.

3086. You put the coasting trade I think at 100 millions. If that is temporarily interrupted on parts of the coast, would the railways be able to carry it?—I think the railways would be able to do almost all the business in this country. The railways are so numerous and so well planned, there is such a superfluity of transport, as it were, that I believe they might be able to do all the business on the coast of Great Britain. Of course, they could not carry on the trade between Great Britain and Ireland.

3087. Your general view is that the outbreak of a great naval war would introduce such a gloomy state of things that the mere question of premiums is small in comparison?—It would be a state of things of which we can hardly form an opinion; especially if we were caught in any way unprepared, and some big disaster happened, the confusion would be something awful, in my opinion.

3088. Several witnesses have told us that the violent fluctuation of premiums would be so great as to be in itself a cause of ships not going to sea. You do not anticipate that?—I should rather think that Lloyd's would be the first place where they would take a commonsense and practical view of the matter. I should not be apprehensive of violent fluctuations continuing for very long. They would take a very practical, commonsense view, and come to business very quickly.

3089. But you do not think that war insurance, especially at the outset of war, could be regarded as anything like a scientific business?—Not in the least. It is more like a case of treating a panic. With a panic in the City when a crisis happens you have got to fight it the best way you can, and get through it, and there are no scientific rules to be laid down beforehand by which the job can be done. What you have got to have is the men to do it, and the quickness and judgment with reference to the actual condition of men's minds at the time.

3090. It would really for some time be a gamble?—A gamble.

3091. Have you seen a book called "Our Next War"?—No, I have not. I have read a great many books about the invasion of England, and other things, but I have not read that particular book.

3092. The writer obtained the accounts of an underwriting firm in 1812, and he makes out that the average rate of that year of war insurance was about 6½ per cent., and eliminating the peace rates he makes it about 5 per cent. Do you think any figures of that kind have the least value in these days?—No, I think not; and the question arises in this case whether the calculations were influenced by the outbreak of war with the United States, which would be the case in 1812, as compared with 1806, when the United States was out of it. Of course, that was a new element suddenly introduced, and might have been very serious at the moment.

3093. I understand you object absolutely to any form of free indemnity?—I do not like a free indemnity.

3094. Do you object to a Government system of insurance at fixed rates, varying in different zones?—I think I am not at all opposed to that varying with different journeys, and never more than certain fixed rates that the Admiralty would be allowed to charge.

3095. And supposing that the maximum rates on the longest zone made up of the rates on the intermediate zones was not more than about 2½ per cent., would you consider that would be sufficient to act as a check upon maritime operations?—That is probably a rate that the trade could stand in a time of emergency and difficulty, although it is a very high rate indeed in one way. It would add considerably to the price of things if it was done now, because people work so much lower.

3096. Of course, if the market would give lower rates they would take those lower rates. Would it not steady trade very much to know that it was possible to get insurance at that maximum rate, whereas it might otherwise any morning jump up to 50 guineas?—Provided trade was not exposed to difficulties and crises at the very time, so that they would not be thinking so much of it.

3097. (*Chairman.*) But in your opinion trade would be exposed to these other difficulties?—That is my opinion, that the trade would be in great difficulties, and that you could hardly do very much by special expedients.

3098. (*Sir George Clarke.*) But the very financial troubles that you anticipate would also tend to make insurance rates rise very high?—It might have a steadying effect to know that such an insurance was behind, and that the Government could do it. It might have a steadying effect at the beginning of hostilities.

3099. And then as the course of the war cleared itself probably rates would drop?—Rates would drop very much. I have no great fear of the effect upon commerce if we get sufficient time.

3100. But if you provided a State system of this kind you would make it conditional that all ships which had this advantage should follow Admiralty directions exactly?—Absolutely. I cannot conceive it being done with the shipowner at liberty to do what he likes.

3101. And you would give the Admiralty power at any time to announce a route closed temporarily?—That is so.

3102. And the Admiralty might also order the ships to take convoy and not proceed without?—That is so.

3103. Would you do that even if the ship was to get nothing from the Government? In the ordinary course of commerce would you insist upon the ships following Admiralty directions, or leave them free?—I do not know that. If a shipowner was willing to take all the risk of capture I do not see why he should not be allowed to send his ship to sea.

3104. Because in the old wars that difficulty arose. The Admiralty wished to insist upon convoy and to detain ships for convoy, and the shipowners sometimes wanted to sail without it?—I am not aware of that, but I know that shipowners would not like to be restricted in that way. It would depend so much upon the captains of the ships. A shipowner might say "I have got a captain who can take a ship quite safely through all the foreign ships about; he knows what to do."

3105. But the system of restriction would be justified if you were going to give State insurance?—Yes, that would be so.

3106. Otherwise you think the shipowner should be free to do what he liked?—Yes.

3107. (*Mr. Huth Jackson.*) You say you do not anticipate any general rise of prices owing to war?—That is my strong opinion.

3108. But at the same time I take it you would anticipate a rise in the prices of food articles and articles of raw material which are imported into this country, would you not?—I would not go quite so far as that. It would depend upon the particular war, and I attach great importance to the fact that the price of wheat did not rise during the American Civil War, although at that very time the price of cotton rose so extravagantly.

3109. Other things being equal, if there were very high premiums charged for insurance that would undoubtedly affect the price of all articles that are imported into this country to the extent of the premium?—It would tend, I think, rather to raise the price.

3110. Supposing there were no rise of prices from other reasons, the imposition of a high insurance premium would undoubtedly raise the prices above what they were to the extent of that premium at least?—That would be so. Of course, you would have to consider that there might be other causes connected with the war operating to lower the prices.

3111. Perfectly; but at the same time, eliminating all other reasons, you would admit that the imposition of this high insurance premium would undoubtedly affect the price of all articles coming to this country?—That would be so.

3112. Do you not anticipate that such a case might even arise that there would be an impossibility of insuring war risks. Taking the figure which you give yourself of £600,000,000 at risk at one moment, all of that clamouring to be insured against war risk, do you fancy that the insurance world would be able to take that?—I should doubt whether it would be quite able to do so, but the point would be that I should doubt if the £600,000,000, or, say, the amount in three months, would ever be insured. So many people would insure themselves even in time of war.

3113. That could only apply, I take it, to ships. It could not apply to cargoes?—I think there are mutual insurance associations for goods as well as for ships. I could not say, but there are mutual insurance companies, and I have always understood that they did business in goods as well as ships.

3114. In any case, the difficulty would be to a certain extent, would it not, taking the banking part of the transactions, that a prudent banker would certainly not undertake the financing of any goods that were not insured?—He would not finance anything that was not insured, and he would also require, I suppose, to be satisfied with the insurance.

3115. Therefore, to that extent, the necessity of insuring the goods at any rate would still be very important, would it not, as most of the goods coming to this country have somehow or other to be financed, and no financing would be possible if the goods were not insured?—That would be so.

3116. Therefore, at any rate, as far as the goods were concerned, out of this £600,000,000 the greater portion of that would have to be insured against war risks, would it not?—It would be expedient to insure if you could. How you could have the business done without insurance is one of the questions that one finds it difficult to follow out.

3117. And that difficulty would tend to cause a rise of prices, would it not?—That would tend to cause a rise of prices. On the other hand, would not all these difficulties of forwarding these goods from the country from which they come to this country tend to cause a fall of prices on the other side? Would you not have the goods offered at a price low enough to enable you to pay the insurance?

3118. That would depend upon the quantity offered outside of England, would it not?—It cuts both ways.

3119. Yes, quite. Then I should like to ask you a question or two with regard to the scheme. You said that you thought that in any case the ships would would have to sail subject to their following Admiralty orders. Would you contemplate that in the event of their following those orders there would be any indemnity to such shipowners for the delay, and the cost of that delay?—I should think there would be no propriety in paying for delay, that the Admiralty would do quite enough in doing the principal thing, and that there would be no occasion for considering such nice questions if the cargoes arrived safely.

3120. But, of course, if the Admiralty gave an indemnity and insisted upon a ship not sailing it is obvious that the Admiralty would do that for the purpose of saving the loss of that ship, which they thought might be inevitable. Therefore, it might be cheaper for them to pay for the demurrage rather than to lose the ship?—That is a small question compared with the serious matters which would have to be considered.

3121. Yes, quite. In such a case, would you propose that the cargoes as well as the ships should be indemnified?—I think the cargoes should be indemnified as much as the ship itself.

3122. Then would you suggest that it should only be British-owned cargoes, or all cargoes in British ships?—I have not thought of that point, because it occurred to me, when I found that British shipping was so much more extensive than ships belonging to the United Kingdom, that that is one of the things the Government would have to consider.

3123. (*Captain Ottley.*) You said you thought the Admiralty should not confine its attention entirely to defeating the enemy and capturing and destroying the enemy's ships, but you thought it would be expedient that the Admiralty should also take special measures for the protection of trade; I was wondering what was in your mind as regards those special measures?—I am at this great disadvantage, that I am not an expert as far as the Admiralty is concerned, and I am not one of the people who have an idea of instructing people who know much better about these things than I do myself. But I think the illustration which I gave of the number of troops necessary to hold a particular country, and the number of troops that it is expedient to place there for other reasons, is a case in point—you not merely wish to hold the country and be absolutely sure that you do hold it, but you wish to hold it without certain incidents happening which you dislike for political and other reasons. You wish not merely to beat the enemy in the case of a maritime war, but you wish for various political reasons to prevent certain other incidents happening which would be extremely disagreeable, and I think it is important to consider these disagreeable incidents as well as the maritime question, which, of course, the Admiralty ought to have in mind.

3124. I think I understand your view. Really, it amounts to this, does it not: That you think it is essential that our fleet should not merely be big enough to defeat the enemy, but should be so large as to impose peace on the world. That would be the analogy to the troops in Ireland?—Not quite. You cannot impose peace on the world.

3125. At any rate, to render it so unlikely that our possible enemies could come out of the war with success that they would hesitate very much in going to war?—No; it does not go so far as that. It means that there are certain incidental things which you ought to prevent if you can. Of course, if you cannot do it—if the enemy is so strong that you cannot adjust these incidental things—you must do the best you can, and make sure of beating the enemy. I quite agree with that. But you should also endeavour to

Sir R. Giffen, K.C.B., F.R.S.
28 May 1907.

have a surplus of force for these other incidental consequences.

3126. But, really, it is a question of the size and the distribution of your fleet. You think your fleet should be of ample proportions?—Entirely. I think, if I might rather venture on a technical point, that to some extent what I suggest is even justified by strategical considerations. It is a question of the security of your base, to a large extent. You ought, for instance, to make it quite impossible, in any war one can conceive, that an enemy's ships should be able to gain an entrance to St. George's Channel, or that an enemy's ships should be able to gain access within a certain distance of the important ports of our country. How far that could be done I cannot tell. But it is a question of the security of your base, to a large extent.

3127. Do you think that the principle of the foundation for your general plans of war necessitates that wherever there is one enemy's ship there should be at least one, if not two, British ships to meet her, and that the object which the Admiralty should have in view should be to hunt down and destroy every warship of the enemy?—I have formed no such idea. That is a matter for them.

3128. We have no other plan. Our fundamental plan is to capture and destroy the ships of the enemy, and when we have destroyed every enemy's ship we have nothing more to do, for then trade is immune?—No doubt when you have destroyed every enemy's ship you have nothing more to do, but at a given moment it might be expedient that you should be able to guarantee certain things at the beginning of a war. For instance, the trade between Great Britain and Ireland is a thing that should be absolutely certain, unless an enemy's fleet should happen to come between you.

3129. (*Chairman.*) I understand you practically to contend this: That the damage involved in a particular military operation might, from the military point of view, be comparatively small, but from the intellectual and moral point of view it might be very considerable, and should be taken into account from a startegical point of view?—I think you have exactly expressed what was in my mind.

FIFTEENTH DAY.

Tuesday, 4th June 1907.

PRESENT:

The Right Hon. Austen Chamberlain M.P. (*Chairman*).

Sir Thomas Glen-Coats, Bart., M.P.
Sir James L. Mackay, G.C.M.G., K.C.I.E.
Sir George Sydenham Clarke, G.C.M.G.
Sir George H. Murray, K.C.B.
Mr. H. Llewellyn Smith, C.B.
Mr. Edward Beauchamp, M.P.
Mr. Henry Neville Gladstone.
Mr. Frederick Huth Jackson.
Mr. Arthur Lindley.
Mr. George H. Duckworth (*Secretary*).

Mr. Charles Edward Brightman, called and examined.

Mr. C. E. Brightman.
4 June 1907.

Mr. Brightman, in a preliminary memorandum,* had submitted:—

(1) That a scheme for a national indemnity without payment of premium is desirable.

(2) That the State guarantee should be confined to ships on the register of the United Kingdom, and their cargoes.

(3) That protection should be given for the "free of capture" clause in a Lloyd's policy. Losses from delay or deviation owing to Admiralty instructions, provided that the destination is ultimately reached, not to be compensated by the State.

(4) That notification by shipowners may reasonably be made a condition of indemnity.

(5) That the value on which indemnity may be claimed should be the insured value of the ship at the time of capture; the value of the cargo to be the value suggested in Scheme A. Cargo-owners not to lose their right to indemnity owing to failure on the part of shipowners to notify.

(6) That claims should be settled by a special Board as suggested in the draft Schemes A and B. The decision of the Board to be final, and claims to be paid forthwith.

(7) That, failing an indemnity, ships would be laid up in time of war.

(8) That neither shipowners nor cargo-owners would feel a small charge for national war insurance in time of peace, though it might be very difficult to collect from cargo-owners.

3130 (*Chairman.*) I think you are the senior partner in the firm of Turner, Brightman, and Co.?—Yes.

3131. Deputy Chairman of the General Shipowners Society; Chairman of the British Steamship Owners Association, and Shipowners' Representative on the Pilotage Board of the Trinity House?—Yes.

3132. You have had before you the two schemes A and B we have sketched out?—Yes.

3133. Are you in favour of either of those schemes, or of any scheme of the sort?—I am in favour of the first scheme, that is indemnity without payment of premium. I should very much prefer, if it could be managed, to charge a premium on the ships and the cargo from, say, after the commencement of a Bill passing in Parliament. But I have looked at that matter very carefully indeed, and although I think that it could be done with regard to the shipping, it seems to me to be absolutely impossible to do it with regard to the goods.

3134. Will you explain how you think it might be done in regard to the shipping?—I think the shipping would be pretty easy if a premium was charged the same as is done, or something similar to what is done, by Lloyd's to-day. Many owners do insure for the war risk, that is to say, for the clause which is included in the Lloyd's policy, what we call the capture clause. I think that, charging, say, half-a-crown per cent. upon the value of the shipping, you could do that with the ships well enough.

3135. And you would propose to make that compulsory on all ships?—Yes. I think if you had it optional you would find some owners who would not take advantage of the scheme.

3136. Then the fund so raised you would have accumu-

* *Vide* note, p. iii.

lated in the hands of the Government as an insurance against losses by war?—I would.

3137. Have you thought what is to be done with the money in the meantime. Is it to lie in the vaults of the Bank, or to be invested?—I suppose it would be invested.

3138. That, of course, would mean that when war broke out and the losses were incurred, the Government would be a seller of its own stocks?—I suppose so.

3139. As well as having probably to issue further new loans?—Yes.

3140. It would be inconvenient from a financial point of view?—Perhaps it might.

3141. Then you say you do not see how to apply that to the cargo?—I have thought of it very much, but I cannot see how it can be done with the cargo.

3142. You do not think it would be possible to make the charge upon the shipowner rather higher, and leave him to distribute the addition (or perhaps he would distribute the whole of it), in the form of a little increase in his freights?—I am afraid not. I think that if the shipowner was charged more than a very nominal sum you would find a very considerable opposition to it.

3143. Do you think that the shipowners would readily accept a proposal that they should be compulsorily charged, say, an eighth of one per cent. in return for such a guarantee?—Of course I have not really consulted the shipowners on the matter, and there will be some opposition naturally, as there is to everything; but when they have looked at it from all points, and see that they would be covered in the case of a war with this country, I think they would agree, provided the amount was small.

3143*. You realise, I think, that it would be necessary for the Government, through the Admiralty or through some department, to reserve the right to impose certain restrictions on sailings if they gave an indemnity?—I do, yes.

3144. Under the present system of private insurance there is nothing corresponding to that, is there?—No.

3145. An underwriter takes a risk or refuses a risk; and he takes it at one price or another, according to the measure of risk that he thinks attaches to it?—Quite.

3146. But he makes no conditions?—Only this condition, what we call the free of capture clause.

3147. But I mean, suppose he is underwriting a war risk, the underwriter to-day may charge a high premium if he thinks there is a great risk, but he does not make any conditions that the shipowner shall not sail under certain circumstances, or anything of that kind?—None whatever.

3148. Do you think that shipowners would willingly accept even a free indemnity, if it restricted their liberty to sail as and when they pleased?—I think they would, because as it stands at present the matter is a very serious one, at least that would be the idea if there was war with this country. I think they would accept, if they were indemnified, some restriction of that sort.

3149. It might conceivably, I think, in particular circumstances, be a very serious restriction on some of the trades, might it not?—It might.

3150. Even amounting, for instance, to closing the Mediterranean, or the North Sea, for a time?—Yes. Of course, that is a very extreme case, I think, but still there might be that.

3151. But your own feeling is that the risks in the alternative of their sailing without a guarantee are so great that upon the whole shipowners would be favourably inclined to the proposal?—That is my feeling.

3152. What do you fear would happen, supposing nothing is done, supposing we go on as we are now, and war breaks out?—Of course, it would depend upon the measure of risk, but if the risk was great I question whether the ships would move from the ports. I think that is what would happen.

3153. If the ships are detained in the ports, they will cost the shipowners something, will they not?—Comparatively little. If they had their crews on board, of course they would, but if they are staying there for any length of time, what the shipowner does is, he pays everybody off, and puts merely a watchman on board, and insures for port risk at a shilling per cent. per month upon his value. Probably in such a case that insurance would be more, but it would be something of that sort.

3154. That would apply mainly to ships in home ports, would it not? The cost of laying up a ship in port overseas would be much greater?—Yes, much greater, but I think the owners would prefer that to running unknown war risks.

3155. You would have to keep the crew, I suppose, then?—Yes, you would have to keep the crew in that case.

3156. On the other hand, the moment you began to lay up ships, and ships were withdrawn from the trade, freights would begin to rise, would they not?—Certainly.

3157. So that you would have a good deal of temptation to the shipowner to come out—a rising freight, and a dead charge, greater or less, going on at home?—Yes; I have thought of that. Of course, you will find men who will run risks, naturally; but the average shipowner is really only a managing owner, and probably has a small share himself in the venture. He would not feel justified in running such a risk as that. If he asked his shareholders, they would probably say at once, "You must not run that risk"; except in a few instances, I think that is what you would find would be the case.

3158. Do you think that the fact that shipping is so largely owned now by limited liability companies would make the managers less enterprising than the owners were in the old days?—I do not think so.

3159. But will they not be willing to take as great risks as owners were in the old days?—I somewhat doubt it, because you see to-day the average shipowner, or managing owner, if you like to call him so, is generally better off than the same man was in the old days, and I think that he would not be inclined to run risks, with a probability of great loss.

3160. Not so much inclined to play double or quits?—No.

3161. There was not any difficulty in getting ships for blockade running, was there, for instance, in the American Civil War?—No, there was not; but what prices did they get then? Of course, if we are going to get freights such as that, I daresay any of us would run that risk. But for anything like 10 or 20 per cent. I do not think for a moment we would do so.

3162. A 10 or 20 per cent. rise, do you mean, or a 10 or 20 per cent. profit?—A 10 or 20 per cent. rise.

3163. Do you think a 10 or 20 per cent. rise would be a very serious factor if we were engaged in a great war?—No.

3164. There would be other causes at work which would make it of small importance?—I think the rise would be probably more than that, but it might not be tempting enough.

3165. (*Mr. Llewellyn Smith.*) Rise in prices or freights?—Rise in freights.

3166. (*Chairman.*) Of course, there might be a rise in prices quite apart from the rise in freights?—Quite. No doubt there would be.

3167. It has been argued by some witnesses that the rise in prices and the disturbance of trade from other causes would be so great that what rise or disturbance is due to interference with shipping would be almost a negligible quantity?—I do not think so.

3168. You yourself are afraid of a great withdrawal of shipping from the seas in the event of a serious war?—I am. Of course, it is quite a matter of opinion, but I think that either you would have practically no captures, or you would have a very large number.

3169. Would you expect this withdrawal to take place at once, or would you expect it only if serious captures took place?—I should think that it would occur after a time; not at once, but after some captures.

3170. You are of opinion, I think, that it is impossible to make the cargo contribute to such a State insurance fund in any way?—I do not see how it can be done. If you put a very small tax upon the cargo, say something to equal what the ship would pay; if you put it, we will say, on a 6,000-ton cargo of wheat, at, say, £50. I fear even that would be un-

Mr. C. E. Brightman.
4 June 1907.

workable as some of these cargoes are sold with scarcely a margin of £50; and so they would sell it, perhaps, to the Continent instead. If such a scheme could be managed, that is to my mind a perfect one, but I cannot see how it can be, so far as the cargo is concerned.

3171. But you feel at the same time that it is essential to extend the indemnity to cargo?—Yes.

3172. And therefore, on the whole, you decide to advocate, as you began by saying, a scheme without payment?—Without payment, yes.

3173. Something on the lines of Scheme A?—Yes.

3174. There may be some difficulty, may there not, in persuading other interests which might be gravely affected by war to give a free indemnity to the shipping interest only?—What other interests?

3175. It has been suggested to us that in the financial world there might be very great disturbance and very heavy losses caused on the outbreak of war. One witness suggested that the first effective sign of war having broken out with a serious enemy would be that when we presented our cheques at our bankers they would not be cashed?—I should not think that.

3176. That may be an extreme way of putting it, but at any rate there might be very considerable disturbance?—There would be disturbance.

3177. Which might have very serious results?—Yes.

3178. If a man had lost very heavily in one of those ways, it would be a bad moment to collect a little additional money from him to indemnify a shipowner?—Yes, it would, but the alternative of stopping food supply would be worse.

3179. That we cannot get over?—I do not think we can.

3180. Then, going to the scheme itself, you are on the whole satisfied, I think, with the definition that is suggested in it of the persons entitled to claim indemnity?—Yes.

3181. What would you do as regards British shipping other than shipping registered in the United Kingdom? How would you treat that?—Are you referring to the Colonies and India?

3182. Yes?—I think I should leave them to look after themselves.

3183. To arrange schemes with their own Governments?—Yes. At present the amount of their shipping is comparatively small.

3184. But probably if their own Government did not arrange schemes it would result in those ships being transferred to the United Kingdom registry?—It might.

3185. (*Sir James Mackay.*) Or it might mean the transfer of British ships to the Indian or Colonial registry to avoid the 2s. 6d. tax?—Perhaps it might do that, but I think not for such an amount.

3186. (*Chairman.*) Then as regards the losses to be covered by indemnity, I think you said just now that what you wanted to cover were the risks that were excepted from the ordinary marine policy?—Yes.

3187. Have you any observation to make on the subject of losses occurring through delay or diversion of route in consequence of Admiralty instructions?—No, excepting that I think the Admiralty should give their instructions about taking certain routes, and that if the owners did not conform to that they should not be covered.

3188. Would you cover them or not for loss due to delay? Suppose a ship was held up for two or three days by the Admiralty in consequence of enemies' cruisers being known to be in the vicinity, and suppose that both the cargo owner and the shipowner incurred a certain amount of loss by delay, would you indemnify them against that loss?—I think not. I am afraid if you are going to do that the bill would be a very, very heavy one.

3189. That would not be covered by the ordinary war insurance policy, would it?—We are covered for detention on this free of capture clause.

3190. (*Mr. Beauchamp.*) Not for demurrage?—Not for demurrage, no.

3191. (*Chairman.*) Nor for loss of market for the cargo?—No.

3192. And you would not propose to go further than that?—No.

3193. As regards the conditions to be complied with in order to secure the indemnity, do you see any difficulty in the proposal that the shipowner should notify to the prescribed Department his intention to sail, and furnish such particulars as may be required?—I think he should do that.

3194. There would be no difficulty in the shipowner doing it?—No.

3195. Upon what value do you think we ought to pay losses?—I think that it should be upon the insured value, unless it is shown that that value is excessive, and I should think that probably a Committee of four or five should judge whether that was an excessive amount as compared with what other ships were insured at at that particular time.

3196. By the insured value I take it you mean the value for which the ship is insured for ordinary marine risks?—Yes.

3197. Let me just ask whether you would allow the shipowner to take out a further policy against war risks if he had already a State guarantee?—No, I would not.

3198. Would the shipowner be content to sail without knowing for certain what value he would receive if his ship were captured?—This is arising out of my last answer?

3199. Yes?—I think so, because I think there would be confidence in a Committee appointed for such a purpose.

3200. The practice of the trade is, is it not, always to insure for a definite sum?—Yes.

3201. And it is also the practically universal habit of the trade to pay that sum without question if a loss is incurred?—Certainly.

3202. That insurance very often is the basis of a good deal of the finance of the trade, is it not, that the owner of the cargo, possibly even the owner of the ship, has advances against his property on condition that it is so insured?—Yes.

3203. Especially with the cargo owner?—Yes.

3204. Do you think that bankers and others who do this business would be content with the knowledge that there was an indemnity, but an indemnity which did not exactly fix the value of the goods, which left the exact value of the goods to be fixed after the loss?—That is a difficulty, but I do not know why they should not, if they got a Committee whom they could trust.

3205. I am not asking for individual names, but would you give me an indication of the sort of Committee that you think should be appointed?—I think purely commercial, say, perhaps, a shipowner, a merchant, and a member of Lloyd's. No doubt you would have to have someone from the Board of Trade, and perhaps, one other commercial man.

3206. Do you think the award of such a Committee as that would be accepted as satisfactory to all concerned?—I think so.

3207. You would allow no appeal?—No appeal.

3208. On any ground whatever?—None, on any ground whatever.

3209. As regards the value of the cargo, you think it would be reasonable to take that as the value of the cargo at the port of shipment, plus insurance and freight to the port of destination?—I think so.

3210. You have already told me that you think it quite reasonable that the Admiralty, or the Government, through whichever department of the State was concerned, should issue instructions to the shipowners, compliance with which should be a condition of the payment of the indemnity?—I think so.

3211. Assuming that a ship is lost through non-compliance by the captain with those instructions, what would you do with the holder of cargo in that ship? Would you indemnify him or not?—I think he ought to be indemnified, because he has had nothing to do with the shortcomings of the owner or the captain.

3212. Then suppose the shipowner said, "But I too have nothing to do with that; my instructions to the captain were to obey whatever orders he got from the Admiralty; he disobeyed me as well as the Admiralty," would you hold him responsible for his agent, or would you indemnify him, too, under those circumstances?—I think he should be indemnified. At the present time

we are in a large number of instances not responsible for the acts of our captains.

3213. Under ordinary insurance policies?—Under ordinary trading.

3214. (*Mr. Lindley.*) There is a special clause inserted to meet those cases in charter parties?—Yes.

3215. (*Sir James Mackay.*) But also under insurance policies?—Yes, that is so.

3216. (*Chairman.*) Do you attach great importance to the prompt settlement of claims?—I think so.

3217. Must that settlement be in cash?—I think so.

3218. I think one of the witnesses, if I remember rightly Mr. Charles Booth, before the Commission on Food Supplies, said that he did not attach so much value to having the payment made in cash if the shipowner at once got a negotiable security from the Government. You think it must be in cash?—I think it would be a great deal better to be in cash. I think it would be an inducement for the owners to, perhaps, agree to terms that they might otherwise not do, because the Government settle many things with shipowners very slowly.

3219. It has been suggested to us that great difficulty might arise in some cases from the war risk being covered in a different quarter to the marine risk; that, for instance, a case might occur where a ship was undoubtedly lost, but where there was no evidence to show whether she was lost through an act of war or through a marine peril?—Yes; we have that now. Whenever there is a war there is always that staring one in the face.

3220. But very commonly now, I suppose, the same parties would have underwritten both the risks?—No, I do not think so. They might, but not necessarily.

3221. In your experience has much difficulty arisen from that?—None whatever. Of course, up to the present we have never had payment. As a matter of fact I did previously insure my firm's ships for war risks, but I have never had to call on the underwriters for anything.

3222. And you have not been engaged, not as one of the belligerent nations, but in shipping that was at risk; for instance, in the Russo-Japanese war?—Yes, I have.

3223. I suppose such a case might have occurred then?—Such a case might have occurred then.

3224. But as far as you know those cases have not led to any practical difficulty?—No.

3225. It has been possible to settle on whom the risk should fall, without prolonged litigation?—I think so.

3226. (*Mr. Llewellyn Smith.*) Is the 2s. 6d. per cent. that you would charge calculated per annum or per voyage?—Per annum.

3227. It would be really a tax of one-eighth per cent. on the value of British tonnage?—That is it.

3228. And that would be payable during times of peace, of course?—Quite.

3229. Supposing such a tax had been put on at the close of the Napoleonic wars, shipowners might have paid it for a century without getting anything out of it, might they not?—Yes.

3230. Do you think that would give rise to a good deal of discontent if it was compulsory?—I do not think it would, if the amount was small. If you put it from the Napoleonic wars of course the amount collected would be large; if you make it even a shilling per cent., it is always something; if you take it upon the value of British shipping at 2s. 6d. per cent., it would be about £275,000 a year. That might be considered too large an amount, but that is a pretty fair sum to start with every year.

3231. If you had a big ship worth £100,000 she would be paying £125 a year?—That is it.

3232. You anticipate a great rise of prices as the consequence of a war. In your opinion would that be due to the actual risk of capture or to a panic? The two things are not quite the same, are they?—Not quite the same. I think it would be probably due to both, but more to the idea of capture.

3233. You do not attach much importance to a baseless panic, a panic that really is not justified?—I do not. Of course, that would probably have to be taken into account.

3234. It has been put to us that at the outbreak of a war, when everything was very uncertain, and we had not had enough experience of the real risk of capture, insurance rates might go up enormously: that it would be all speculative; but that things would settle themselves after a few months?—That is not my opinion.

3235. You think that the real risk would increase?—I do.

3236. You suggested that ships would be laid up because of the risk, but would there not be underwriters who would take that risk? The actual risk would not fall on the shipowner, for I suppose he would always insure, would he not?—Yes, but the difficulty would be, if there was an enormous number lost, whether any association could bear such a loss.

3237. You think it might not be possible to insure, that the risks might be refused by underwriters?—They might be refused, or they might be taken, but I do not think any association could bear such a strain with a large number of captures.

3238. Do you mean if our Fleet was defeated?—Yes.

3239. There would be so many other risks then, would there not?—I mean if there was any very large amount to pay it would be questionable to my mind—I hope gentlemen from Lloyd's will not mind my saying it—whether Lloyd's could stand it. That is just the feeling with shipowners.

3240. The liability for the State would then be very large?—It would be large.

3241. It has been suggested that instead of putting on a peace tax there should be a charge made for the indemnity when a war breaks out, say that we should have 2½ per cent., or 5 per cent., or whatever it may be?—But for that to be of any use you would have to charge a very large amount.

3242. In order for it to be self-supporting?—Yes, I think so.

3243. You would put the rate of risk pretty high?—I should.

3244. It would depend on the character of the war, of course?—Naturally.

3245. (*Mr. Huth Jackson.*) I think that of the two schemes that we put before you you would prefer as a scheme the free policy rather than the purchased indemnity, but you would like to see, if possible, some modification of that by charging during peace a premium on the tonnage per annum?—That is so.

3246. But of these two schemes that are put forward Scheme B, to come into operation in time of war, I understand you do not think would be feasible?—I do not say it would not be feasible, but I think that to be any use at all you would have to charge a very high premium then.

3247. With the idea of accumulating sufficient funds to meet the losses; is that it?—Quite.

3248. But, of course, as you know, the idea was not so much to make the premium commensurate to the risk, but it was more to make the shipowner and the cargo owner pay something. Would that modify your opinion?—That would, of course, to some extent, but to my mind the scheme charging from now would be much more acceptable.

3249. Then you would charge an eighth per cent. on the registered tonnage?—No, on the insured value.

3250. On the marine insured value of the shipping?—Yes.

3251. Would you apply that to steamers as well as to sailers?—I would.

3252. You do not think from your experience that the insured value would in some cases be more than the actual value?—In many cases it would be more, but I think it should be on the insured value, unless that insured value is shown to be considerably above what is the ordinarily insured value for similar vessels at that particular time.

3253. It has been suggested by some witnesses that it might be on the cost of the steamer or the vessel, less so much per annum for depreciation?—I should prefer the other.

3254. Then you would include sailing vessels as well as steamers?—Yes.

3255. And you would charge the same rate for both?—The same rate.

3256. You suggest an eighth per cent.?—I merely suggest that because I think that is Lloyd's premium.

Mr. C. E. Brightman.

4 June 1907.

3257. Then you anticipate that if nothing of that kind is done it is quite possible that a certain quantity of the shipping might be unable to sail in time of war?—I do.

3258. And you have indicated that if there were very considerable losses it might be possible that the policy of insurance would not be accepted by the bankers, who are expected to finance, we will say, the cargo, because the losses had been so much that the security of the policy was no longer a good one. That is so, I think, is it not?—I think that would be so, and that, of course, is a great objection.

3259. That would be an argument in favour of some form of national indemnity?—Yes.

3260. With regard to the crews of vessels, could you give any indication as to the proportion of Naval Reserve men now in the mercantile marine?—Do you take in tramp steamers, for instance?

3261. Yes. Is there any means of ascertaining the proportion of Naval Reserve men in the mercantile marine?—I am afraid not, but I should think it is a very small proportion indeed.

3262. And what proportion of foreign sailors would there be in the mercantile marine?—I do not know. The Board of Trade have got those figures, I believe.

3263. Would there be any risk of British ships being unable to sail in time of war, first of all by the withdrawal of the Naval Reserve men, and, secondly, by the withdrawal of foreigners?—I think there would be a great difficulty.

3264. And that difficulty no scheme of insurance would be able to get over?—No. We have not got to-day nearly enough British seamen for the mercantile marine.

3265. Then you indicated that you thought the cargo owner ought to be indemnified, even if the captain of the steamer or sailer, by disobeying the orders of the Admiralty, had forfeited all claim to indemnity?—Yes.

3266. But I think you went further than that and said that the shipowner ought also to be indemnified if he could prove that the captain had disobeyed his own orders?—Yes.

3267. Would not that in most cases practically mean that the State would have to pay under all circumstances?—No, I do not think necessarily so.

3268. You could hardly imagine a shipowner saying that he authorised his captain to go in the face of the Admiralty orders, could you?—I suppose one must always think, at all events, that people are honest. That you will find some such as those you have in mind I dare say, but I do not think that would be so with the majority; and of course it is one thing to say a thing and another to prove it, and they must prove it.

3269. That would lead to considerable delay?—That might, but I think you would very likely find that the captain, to save his own skin, would peach on the owner if there was anything of that kind.

3270. You do not think the owner of the steamer ought to take all responsibility for the man whom he is employing as the captain of his vessel?—I will not go so far as to say that that might not be put into one of the schemes. I think perhaps it would be, but if you ask my opinion I think that the owner should be exonerated from all blame if the captain has done something diametrically opposed to his instructions.

3271. (*Mr. Lindley.*) Do you attach any special importance to the valuation you have put in the policy, the value of the ship at the time of capture?—You see, you must have some value, and I think an owner should be indemnified, generally speaking, for his insured value, the same as he insures now at Lloyd's, unless that insured value were more than is the usually insured value of ships at that time. The insured value, as of course we know well enough, is not necessarily the real value. But still I think that an owner would not be content to take what you might call the real value.

3272. Might not that be met by giving the owner a right to effect a further insurance over and above the guarantee?—I am afraid you might have complications between the two if you had two policies.

3273. Why, if the one is only to come into force over and above the guarantee?—I think you would.

3274. You have it done nowadays constantly where a vessel is insured all risks in a certain sum, and a certain further sum is done on disbursements?—Yes.

3275. A similar thing could be done here?—This would be a Government guarantee.

3276. Yes, precisely, but a Government guarantee for the actual value?—I think you would have complications between the two.

3277. Do you anticipate any difficulty in fixing the actual value?—None whatever.

3278. Then if that is the case you have to fix it to ascertain whether the insured value is too much or too little, have you not?—But where would you bring in the Lloyd's policy apart from the Government?

3279. Leave the shipowner to make his own bargain with the underwriters for any further policy he took out?—Any further policy beyond what?

3280. Beyond the guarantee. Suppose, for instance, the actual value of the ship is £20,000, and he gets that from the Government, and he takes out another policy for £5,000 on disbursements, do you see any objection to that?—My difficulty is this: Not only do I think there would be complications, but I do not think you would get the owners for any very large amount to think that their security in insuring outside the Government would be good enough in the event of a great war; I will put it in that way.

3281. It would only be to a small amount, if it is only the excess?—But that would be a very large amount in the aggregate.

3282. In the aggregate, yes. Then, in answer to the Chairman, you said you thought there should be no appeal against the decision of the Committee appointed to deal with any question of claims?—I did.

3283. Do you not think that might cause some difficulty with the owner, and the same with regard to the State, too, taking away the possibility of appealing to the Law Courts in the event of a dispute?—I think it would be far better to have the thing settled once and for all.

3284. You think that that, being a condition of the free indemnity, might be enforced?—I think so.

3285. (*Mr. Beauchamp.*) You think that, failing an indemnity, ships would be laid up in the time of war?—I think so.

3286. But that would not be the case so long as they could be insured, would it?—No.

3287. So long as the insurance could be carried on, the vessels would not be laid up?—I think not.

3288. I think you do insure your ships against war risks?—I have done. I am not doing it at the present time.

3289. Then there are Protection and Indemnity Associations, which cover that risk?—Yes; there are clubs which issue policies in time of peace, but the clubs are supposed to be inoperative until time of war.

3290. Inoperative till the time of war?—Yes.

3291. Then what is the advantage of those if they are inoperative? Do not they charge a premium during the time of peace?—One with which I was connected charged £1 per boat per annum, so I leave you to judge whether that would be much use. In fact, candidly, I do not think that the members of the clubs would stand paying for these risks. Of course, coming upon the whole of the shipowners, which would not be likely, it might be different, but, otherwise, with the club you would get people who, when the time came, would say, "This particular shipowner is running a risk; he is going to parts of the world where he is likely to be captured, and I am in parts of the world where it is absolutely impossible for me to be captured, and therefore I shall not pay towards his loss." So far as the clubs are concerned, I am not an advocate for them in that way.

3292. I have here the rules of one of the clubs?—Is that the "North of England"?

3293. Yes. A large number of steamers are entered in that club for war risk?—I was entered, too, in one of them. I do not know what the "North of England" is, but probably something similar.

3294. In the "North of England" they charge 2d. per cent. upon the value entered in Section A?—Of course, that is more than the £1 I previously named.

3295. Then they limit themselves as to the amounts for which they are liable in the event of war. I see that no member can be called upon to pay more than 2s. 6d. per cent.?—I do not know the rules of the "North of England" in the matter, but some who do take the risk impose such conditions that really it is scarcely a war indemnity at all.

3296. And do you not think that these clubs would be able to cover the risk of war in the event of a war occurring?—I do not think they would get their members to agree to it, because, as I say, those who are in trades where the war is likely to affect them will naturally want to be covered, and those who are not will not, and will not pay for those who do.

3297. (*Mr. Lindley.*) That means an exodus from the club?—I think so, unless the war risk is separated from the others, as it probably would be.

3298. (*Mr. Beauchamp.*) You have expressed the opinion that Lloyd's would not be able, perhaps, to pay the losses in the event of a great war. I suppose you did not mean to confine yourself strictly to Lloyd's; you used the word "Lloyd's" as embracing the insurance world?—Quite.

3299. With regard to the valuation, if there is the registration fee which you suggest, whether it be 1s. or 2s. 6d., there would be no difficulty, when the ship was registered, in fixing the value, would there?—Except that, of course, a man might insure for double his value.

3300. But then the Department would be able to agree with the owner the value of the ship at the time at which it was brought in, would they not? I mean to say when ships are insured in clubs there is always a valuation fixed, is there not, on a certain day?—Yes, but then this is rather different. I think, where the Government will have to pay. Where there is an agreement between an underwriter at Lloyd's, or an insurance company, and the owner, that is an agreement between two people, but I think that, so far as the Government are concerned, they should take more steps to discover the proper value than what is done to-day by Lloyd's or the insurance companies.

3301. But the owner would, under your scheme, have to pay during time of peace a small war premium, and there would be no great object in his fixing the value very high during time of peace, would there?—No, perhaps not; but I should prefer it the way I put it, because I dislike disputes, and I think it is best to come to a decision at once what it is to be. In the case of steamers built when war was imminent, values on such might be excessive.

3302. But then there are a large number of steamers which are not insured at all, which run their own risk?—Quite so, and, as I have stated, I think the amount which they should insure for should be the amount which is a fair marketable insurance amount at that time.

3303. Then you laid it down very strongly that there should be no appeal against the decision of the Board of Claims, as we call it?—I do. I think you will have the Law Courts full if you have it the other way.

3304. But there might be a case where the Board of Claims would say: "This is not a war risk, and therefore we will not pay you." Then the owner would proceed in a Court of Law against the underwriters on the marine risk, and the law would decide that it was not a marine risk. Then the man would fall between two stools, because he could not take the Government into the Court of Law, as there would be no appeal?—Personally, I should have sufficient confidence in such a committee as I have named, quite as much as I should have with judges of the land.

3305. Yes, but you see the man is left in this position: He has a right of appeal in one case, but he would not have the right of appeal in the other?—That is so.

3306. Therefore, it would not seem to be quite equitable to deprive him of his right of appeal?—I think he would get justice.

3307. (*Sir James Mackay.*) Would it not be a little hard on vessels which had paid their insurance for, say, 20 years during peace, and rather advantageous for a new ship coming on the year before a war broke out?—Yes. Well, we never know when war is going to break out.

3308. You say you insured against war risks for some time?—I have done so. I am not doing so at the present time.

3309. Why have you given it up?—Simply because my own opinion is that war is not near. I may be wrong.

3310. Would it not be a little hard to force all shipowners to begin insuring at the present time. It would be a little hard on yourself, would it not?—I do not think so. You cannot have it every way.

3311. Would it not be rather a handicap on British shipping as against German, to force the British shipowner to insure against his will?—I do not think it would.

3312. For instance, you would have to insure against your will, while the German shipowner would not be forced to insure. He would do his business on business-like lines?—The amount would be so small, that is the reason I put it at so small an amount, and if you like you can put it at less than that.

3313. Take the P. and O. Fleet. I fancy the P. and O. Fleet must be worth about £6,000,000?—Yes.

3314. Two shillings and sixpence per cent. on that would be something like £7500 a year, would it not?—Yes.

3315. That would be rather a serious tax to force the P. and O. Company to pay, would it not?—What, to be indemnified against the risks of war?

3316. Yes?—I should have thought not.

3317. Would it not be better to have it in their own pocket for, say, 20 years, and then take care of themselves when war broke out?—I do not think so. Suppose one P. and O. boat was sunk in the war.

3318. She need not be sunk unless she likes. She can take care of herself. She can lay up?—She can lay up, yes.

3319. Or she can insure. If she cannot insure, of course it is quite evident she would lay up, because the risks would be so great that she would not take them?—Yes, but I lay stress on the point that I do not think any ordinary insurance is sufficiently solid.

3320. You want to make this compulsory on all shipowners?—I do not think you can make it compulsory unless you make the goods compulsory. I say that is the scheme which I prefer, that you shall make it compulsory on the ships and make it compulsory on the goods.

3321. But then you say you cannot make it compulsory on the goods?—Then I would not make it compulsory on the ships.

3322. I thought you said, in reply to the Chairman's question (No. 3135) that you would not give them the option?—No. My remarks were that I think the scheme should be that both should pay, but I cannot see how it can be done with regard to cargo, and therefore, as it cannot be done with regard to the cargo, I do not think it would be fair to do it with the ships.

3323. Then you would not make it compulsory on the ships to insure?—Not unless you do it with the cargo.

3324. And you do not see your way to do it with the cargo?—I do not think so.

3325. Therefore you come to the conclusion that it should be optional?—When you say optional, do you mean optional to insure with the Government?

3326. Yes?—No. I would have the indemnity.

3327. Then you would have the free indemnity?—Yes.

3328. You would make no charge?—No.

3329. Practically then you rule out your 2s. 6d. per cent. scheme?—I rule it out, for the simple reason that I do not know what to do with the goods. As before stated, if such a scheme could be worked for both to pay premium, to my mind, it is the best, but I cannot see how you can bring in the goods.

3330. And you go for free indemnity?—Yes.

3331. (*Sir George Clarke.*) May we take it then that all compulsion is thrown out practically. We come to free indemnity without any payment on the part of anybody?—Yes.

3332. In the event of war on any large scale there would be a large shortage of shipping, because many ships would be laid up?—Yes.

Mr. C. E. Brightman.

4 June 1907.

3333. Do you anticipate large rises in freight?—There would be, of course.

3334. Very large rises in freights, probably?—Probably.

3335. Also there is no doubt, I suppose, that in the event of a war in which we are engaged, the Admiralty will take a very large amount of tonnage for transport purposes on very advantageous terms?—Yes.

3336. You also think that every interest would suffer badly in a great war?—Yes.

3337. Would not the free compensation of one section of interests be likely to be regarded as most inequitable by the community at large?—Yes, it probably would.

3338. Then you do not propose to indemnify ships or cargo belonging to India and the Colonies?—No; I cannot see very well how they can be brought in.

3339. If you excluded them, would not that be rather a severe blow at the whole conception of the Empire?—I have thought of that. Personally I think that the Colonies and India cannot easily be brought in to either scheme.

3340. It would touch some sentiments rather strongly?—I am afraid it would complicate the matter very much if you brought them in.

3341. If there was the great rise of freights that you anticipate, it would be possible to stand a considerable rise in insurance premiums?—Yes.

3342. And, therefore, there is no case for indemnity at all, unless the premiums rose to quite exceptional heights?—Yes, but I come back to what I have stated once or twice, that I do not think the indemnity would be considered under such circumstances to be sufficient by the owners.

3343. (*Chairman.*) Not a State indemnity?—No. The question is that we could insure the risks.

3344. (*Sir George Clarke.*) No. My point is that unless the normal insurance rose to very exceptional rates there is really no case for indemnity, because with the higher freights you are going to get you could stand a considerable rise of the market rates of insurance?—Yes, but then when we have insured we want our money. I do not consider that Lloyd's and the Companies in a great war could stand such a drain as there would be.

3345. That view demands that there should be an enormous number of captures?—Yes.

3346. Supposing the captures were not very large, do you think, as some witnesses have told us, that there might still, owing to scares, be such violent fluctuations in the insurance market as to tend to lay up shipping?—Yes.

3347. You think that?—I do.

3348. I think you admitted that if ships which had disregarded Admiralty instructions could claim indemnity, those instructions would be practically useless?—Yes.

3349. You admit that?—Yes.

3350. Would there not be rather a strong inducement to disregard those instructions if you could get your cargo into a place where it was wanted very quickly?—I said that the ships should follow the Admiralty instructions.

3351. Yes, but still if their captains did not, for any reason, they would still get their compensation?—Yes.

3352. Is there not rather a strong inducement to disregard, or might there not be?—Of course, one might say something similar with any insurance now.

3353. Would you rather have some system of insurance as indicated in Scheme B than nothing? That is a scheme under which insurance rates would be paid on both the ship and cargo?—On payment of a premium?

3354. Yes?—It is assumed that that premium is payable only when war is declared?

3355. Certainly. Would you rather have a scheme of that kind than nothing?—I think I would.

3356. Your objection to that scheme generally is that the premiums must be very high?—Yes.

3357. If they were not very high, say about 2½ per cent. on the longest voyage, do you think that would be a prohibitive rate?—No; but I should think it would be a very great deal more than that.

3358. Of course, that would depend entirely upon the efficiency and sufficiency of the Navy?—Yes.

3359. (*Chairman.*) As regards the probability of shipowners generally being willing to bear such a charge as you suggest, there is a good deal of complaint at the present time, is there not, among shipowners at the charge made to them for the lighting of the coasts?—Yes.

3360. Would not your charge amount very nearly to the same sum annually on the shipping of the United Kingdom?—Yes, I daresay it would. I do not know exactly what that would come out at. The light dues I should think would be more.

3361. We had the value of the shipping of the United Kingdom put to us by Sir Robert Giffen the other day as £212,000,000 sterling. An eighth per cent. of that would be £265,000, and I think the present produce of the light dues is just about £300,000?—Yes.

3362. With the experience of the dissatisfaction felt by shipowners at the light dues, are you not a little afraid that they would be disinclined to contribute this sum?—I daresay some would be disinclined. They have always said, as you know, that the lighting should be done by the Country, and it is done in every Country but this and Turkey. It is not so much, to my mind, really the amount; I think it is the principle that they are so strong about.

3363. Still, year in and year out they get something in return for paying light dues, and year in and year out they might not get anything in return for this tax?—No, but the fact of their being indemnified in that way I think is a very considerable one for the shipowners. But, as I said before, I think the shipowners would very strongly object, and I do not think you would carry it through, unless the goods bore their proportion of it. You see in my scheme here I state distinctly that the two are bound up together.

3364. Yes. Then just to make that perfectly clear, your view is that it would be desirable to make some charge to both shipowners and cargo owners for the indemnity if it were possible?—If it were possible.

3365. Your view is that it is possible in the case of shipowners, but not in the case of the cargo owners?—I do not see how it can be done. There would be the cry of Protection at once, for one thing.

3366. And in your opinion the two must stand together?—I think so.

3367. And if one is charged both must be charged; if one is free both must be free?—I think so.

SIXTEENTH DAY.

Tuesday, 11th June, 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Mr. H. LLEWELLYN SMITH, C.B.
Captain C. L. OTTLEY, R.N., M.V.O.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. FREDERICK HUTH JACKSON.
Mr. ARTHUR LINDLEY.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. HARRY RISCH MILLER, called and examined.

Mr. H. R. Miller.
11 June 1907.

Mr. Miller, in a preliminary memorandum,* had submitted:—

(1) That there is a strong feeling among shipowners in favour of some form of National Guarantee against war risks.

(2). That the value on which losses of ships should be paid should be their approximate market value in addition to some allowance for interest on capital. Owners to declare values yearly to Government.

(3) That merchants should be compensated for loss of cargo, though it would be very difficult to give compensation for cargo equitably.

(4) That shipowners and cargo-owners should be on the same footing if contributions are demanded by the State, but that difficulties in the way of collection from cargo-owners are so great that it is probably better to make the indemnity gratuitous for both.

(5) That, failing an indemnity, transfers of British shipping to a neutral flag might be attempted, and, if successful, the practice would be largely extended.

(6) That rates of premium in war time would be prohibitive, and the market for war risks limited.

(7) That Admiralty control should be an essential part of any scheme of State Indemnity.

(8) That the effect of such a control upon freights would have to be considered.

(9) That the decision of the Board of Claims should be final.

(10.) That Scheme A is to be preferred to Scheme B.

3368. (*Chairman.*) You are a member of the firm of Thomas R. Miller and Son?—Yes.

3369. Your firm are managers of the United Kingdom Mutual Steamship Assurance Association?—Yes.

3370. Will you give me some idea of the scope of your Association?—The scope and object of the Association is to protect shipowners against risks that they may run by virtue of their being shipowners, third party risks in respect of certain matters set out in the rules, such as loss of life, personal injury, damage to other ships, damage to piers, loss of cargo, and all matters of that kind.

3371. What amount of tonnage is represented in the Association?—Not quite 2,000,000 tons, but approximately that.

3372. So that you are in constant business connection with the owners of a large quantity of shipping?—Yes; we are continually coming into contact with a large number of shipowners.

3373. You know the nature of the reference to this Committee?—Yes, I have read the submission.

3374. Have you formed any opinion as to the views of shipowners generally on the subject?—Yes. I might perhaps explain that about the time of the Fashoda incident, we summoned a large representative meeting of shipowners to ascertain their views on the subject of whether or not it was desirable to form an Association for covering them against war risks. That meeting represented a very large tonnage—I should think between 15,000,000 and 16,000,000 tons probably. The views expressed at that meeting were that it was a matter really that the State should take up, and either pay them for their losses or formulate a scheme of insurance. One of the ideas was that it was impracticable for shipowners themselves to do this, partly because the losses might be heavy, and partly because they thought it was a duty which the State owed to them, inasmuch as they carry the food of the country, and the country was dependent upon them for their supplies. The strong opinion expressed at that meeting was that the State should insure them against the risks which they would run in time of war. From that meeting, and from subsequent discussion with shipowners, I have formed the opinion that the general view of shipowners is that the State should do something rather than that private enterprise should take it up.

3375. Was the shipping represented at that meeting drawn from all over the United Kingdom?—To a great extent, but it was mostly cargo boats, as distinguished from liners.

3376. But not confined to the Port of London?—No, not by any means.

3377. You say that one of the grounds on which the opinion was expressed that the State should undertake to give an indemnity was because they were engaged in bringing food to this country?—That was one of the grounds on which they thought the State owed them a duty.

3378. Did they suggest that the indemnity should be confined to vessels which did bring food or raw material?—No, the matter was not gone into from that point of view. We were discussing it from an insurance point of view, purely questions of amounts of premium and questions of cover, and that sort of thing. But that was a view that was expressed incidentally.

3379. Do you think it would be practicable, supposing we had a scheme, to make any distinction between different kinds of cargo?—It would be very difficult, in my view.

* *Vide* note, p. iii.

Mr. H. R. Miller.

11 June 1907.

3380. On the whole, therefore, you would advise that any scheme should contemplate treating all cargo alike?—I think so. Of course, one could make a distinction, but I think it would be difficult.

3381. Assuming that we have such a scheme, will you tell me what, in your opinion, would be the proper way to fix the value of a ship for the purposes of the indemnity?—In my view, an owner ought to be content with what he would recover as if he had in fact insured his vessel against war risk, and the usual practice in that case would be to declare a value at the commencement of the period in which you obtain your policy from your underwriters. For instance, if I have a twelve months' policy, as distinguished from a voyage policy, then at the beginning of those twelve months I declare the value of my steamer, and, if my steamer is totally lost, apart from any total loss policies I may have, I recover that value. That is a value that I am content to insure my vessel at, and therefore I think that if at any arbitrary date in the year the owners were to declare to the Government a value, you could pay them that value if the vessel were captured or lost by war risk. I do not think it would be fair to wait until the ship is seized, when the values might be very much higher, owing to circumstances, or might be very much lower.

3382. And you would therefore suggest that at the commencement of every year the shipowners should declare the value of his ship?—Yes. I think that would be the fair way.

3383. And that that should be the agreed value as between the State and himself for the ensuing twelve months?—That is so.

3384. I gather you would make the scheme compulsory on all shipowners?—Well, if an owner did not declare his value he would become his own underwriter. I think he would be only too pleased to declare his value. I do not see why it should be made compulsory. I think it is an advantage that the State ought to offer, and that the owner would very willingly take.

3385. (*Sir George Murray.*) Would there be no check on his valuation?—My idea is this, that if the Government had any reason to think that his value was too high, or that it was a fictitious value, or anything of that kind, you might have an Assessment Committee, and the Assessment Committee might call upon him to prove his value, or to have it submitted to the Assessors, and let the Assessors settle it. It would be a very simple thing, I imagine.

3386. (*Sir James Mackay.*) Are you contemplating a payment in return for the indemnity?—No, not in the scheme I am speaking of just now. You mean a contribution by the shipowner?

3387. Yes?—No, I was not thinking of that for the moment. Still, you could pay your premium on that value in the same way as you pay your loss.

3388. (*Chairman.*) Your object, you say, would be to practically return to the shipowner the value for which he would ordinarily insure his ship?—Certainly.

3389. Against marine risks?—Against marine risks.

3390. Would you allow him, if a national indemnity were granted, to insure himself for a further sum privately?—Yes, I think so.

3391. Might that not lead to serious frauds in some cases?—Personally, I do not think so, because at the present moment the owner, if he is so disposed, can insure his ship. Let us say her value is £40,000; he may insure her for £40,000 and have some honour policies in addition to that. It does not necessarily lead to fraud, because of those honour policies.

3392. One of the checks which now exist would be absent if he made no payment in respect of the State indemnity?—Yes. It might perhaps be desirable to limit his cover to the amount that the State affords him.

3393. The object of any scheme of indemnity must be that the ship and the cargo should arrive safely here?—Yes, obviously.

3394. If you make it possible for the shipowner to recover—I will take an extreme case—the full value of his ship, without payment of premium from the State, and on payment of premium to an underwriter to recover the full value in the market a second time, would that not be rather dangerous?—Of course, it might be, but if the owner has to comply with the regulations that are issued by the Admiralty, if you made that a condition, as I presume you would, then I do not see how any danger on that score could arise, because if the ship were lost in the ordinary way by running on a reef, or grounding, or anything of that kind, naturally no indemnity would be payable. But if the loss occurred after compliance with the Admiralty requirements, I do not see how any idea of fraud could come into it.

3395. I suppose the Admiralty requirements must necessarily be fairly general?—Yes.

3396. They would probably indicate that particular routes or particular places were unsafe or banned at particular moments?—Yes.

3397. But, keeping within those requirements, there would still be room for great discretion on the part of a captain?—Not within the hostile area. A ship coming from the Plate might perhaps safely get as far as Las Palmas, and would not be in any very great danger. After she got to Las Palmas she might be in a very dangerous zone, and then strict compliance would be necessary.

3398. But even at the moment when she was sighted by the enemy, supposing she was unfortunate enough to be so sighted, a good deal might depend on the courage, the enterprise, and the discretion of the captain?—Taking the ordinary British captain, as I know him, I think, as a rule, he would want to get through. He would not want to throw away his ship.

3399. On the whole, therefore, you are not afraid of such a scheme leading to fraud?—Of course you cannot prevent fraud if one has an intention thereto, but I cannot see that such a scheme would necessarily open the door to fraud.

3400. Or, short of fraud, to carelessness involving the State in unnecessary loss?—I do not see why it should. I think, on the contrary, those in charge of the steamer would be rather proud of their achievement.

3401. It has been put to us by some witnesses that the shipowner never makes so profitable a voyage as when his ship is lost?—That entirely depends upon circumstances. Ships are a most extraordinary investment; you will sometimes get two ships—sister ships—for which practically the same amount has been paid, and one always makes money while the other never does. It is a most extraordinary thing.

3402. Then I turn to the cargoes. I presume, from what you have already said, that you would include the cargoes in the indemnity?—The cargo coming to this country, yes.

3403. But you would not extend the indemnity to cargoes going elsewhere?—No. Why should we?

3404. Would it not be equally important, both for our mercantile marine and our trade as a whole, that we should secure the free exit of our manufactured produce? Is not that as important to us as to secure the free entry of raw materials?—I only had in contemplation cargoes coming to this country or the Continent. But exports, of course, we should protect.

3405. But you would not give any indemnity to cargoes in British ships going to Continental or colonial ports?—Presumably they would not be subject to capture. I do not know quite whether that is so, but I would not, even if they were.

3406. Your object being to secure the supplies for this country to maintain its trade?—Yes.

3407. Would it seriously affect the shipping, especially the tramp shipping, if the indemnity did not extend to all their voyages? To make my meaning clear, perhaps I may add something. Do not a good many tramp steamers practically make a circular voyage, and their power, say, to bring corn from America here, really depends not merely on the freight they get for that, but on the freight they have got on an outward voyage and a continuous voyage which eventually takes them to New York?—What they call, in ordinary parlance, a round voyage. The outward freight may not pay, the homeward freight may pay, or *vice versâ*, and taking the round voyage the voyage pays, but any individual part of it perhaps not.

3408. Yes. Suppose, therefore, half the round voyage was not covered, would that make a serious hole in the scheme?—No; that ordinarily happens with tramp steamers—those that do not run on regular lines. I am not speaking of those tramp steamers which are semi-liners, if one may use that expression, those that

go regularly on more or less mapped-out routes, but a vessel, say, that carries coal to Genoa and brings back corn from the Black Sea. It may be that the outward voyage may be good and the homeward voyage bad, or *vice versâ*. It is obvious that that vessel must be protected on the way out, but the cargo on board that vessel is a different thing.

3409. You do not think it would be necessary?—Of course, if the cargo owner said, "Look here, I am not going to put my cargo on board your ship unless you, as a shipowner, insure the risk," it might be necessary to insure the whole venture.

3410. So far we have spoken on the assumption that the indemnity was to be given free?—Yes.

3411. If we were unable to recommend that, do you think that shipowners as a body would be prepared to contribute in return for such an indemnity?—Yes, as a body I think they would. Of course, there are always some people who would object, but I think, knowing the shipowners as I do—that is to say, the tramp or cargo boat owners—taking them as a whole, they would be prepared to contribute something.

3412. To contribute in peace time?—Of course, I mean in peace time.

3413. With a view to accumulating a fund to meet losses?—Yes.

3414. Have you formed any idea in your mind what sort of contribution we might reasonably expect to get from them?—It would have to be in the nature of a premium such as one would pay for war risks in ordinary time of peace, and, of course, trade has such a lot to do with that. If you give certain warranties as to trade and so on I should presume—I am not an underwriter, so, of course, I do not know—you might be able to get a different rate of premium, trading, say, to America and back, from what you would trading to the Baltic and back. It might be that the rate of premium to America and back would be less than to the Baltic and back.

3415. Would it in ordinary times of peace?—I say it might be. I do not know. I am not sufficiently expert in underwriting to express an opinion upon it.

3416. Suppose we proposed a charge of an eighth per cent. on the agreed value?—I do not think anybody would object to that. I think that ought to be on the assumption that the cargo also contributes some thing. That would be rather a difficult matter.

3417. It is much more difficult to find a means of assessing a charge on cargo, is it not?—It is much more difficult to find a means of assessing it, and so many other questions are involved. The mere question of collection of the amount I do not think is at all difficult.

3418. (*Sir James Mackay.*) You could not charge the cargo per annum, of course?—No, you would have to charge each cargo as it came in. You would have to make the broker, or the Custom House, or some department, a tax collector.

3419. You would want different rates for different districts?—You would require to have certain cargoes classified. In fact, all the imports into this country, in my view, you would have to classify, and you would have to arrange differential rates for each class of cargo.

3420. And for the distance it has been brought?—All these things should be taken into consideration.

3421. And how would you act with regard to exports?—I would rather not express a definite opinion about that, because that is the real difficulty—viz., getting cargo to contribute anything.

3422. (*Chairman.*) In the précis with which you have been good enough to favour me I note that you say that the difficulties of collection from cargo and the amount to be paid by different kinds of cargo present almost insuperable obstacles?—I do not mean the actual collection. That is simple enough, but to make a fair contribution as between cargo and cargo. The time at which it arrives, the place at which it arrives, the distance which it has been carried, and a whole lot of other considerations necessarily entering into it are so difficult to reconcile that I doubt whether any fair and equitable scheme could be arranged. I could easily imagine some very highly controversial points on the collection of a contribution from cargo.

3423. I have felt the same difficulty. It has suggested itself to my mind that you might collect the charge from the cargo owner through the shipowner?—Yes, it is possible.

3424. I am not sure whether you understand what I mean. My idea was that you should put a rather heavier charge upon the shipowner, with the idea that he would get it back in freights, that he would treat it as a charge on the business?—It is so difficult when you talk about getting things back in the freight. You have a clause in the charter party, and before you agree any of the clauses you practically agree the freight. Then the broker comes along with his document—a common form one, we will say, but generally there are one or two clauses that want altering, and when you begin to alter these clauses the alterations must have some commercial value. You have practically agreed your freight, and when you alter these clauses you alter the value of your freight. Of course, in the end it must find its level, but I do not think just in that manner exactly can you say to the owner, "We are charging a little more now; you must look to your freight to get it back."

3425. You do not think it would be satisfactory to him?—I certainly think it would not be satisfactory to the owner. Of course, in the end it must find its level, but I do not think you can regard it from that point of view. There is a little more complication than that about it.

3426. On the whole, therefore, you are in favour of a scheme without contribution from either shipowners or cargo owners?—Without contribution from either shipowners or cargo owners, as being the simpler plan.

3427. Would you be willing to contemplate a scheme which, recognising the difficulties that you have been explaining to us in relation to cargo, secured a contribution from the shipowner and let the cargo owner go scot free, or would you feel that was too inequitable?—My idea is that the owner would look upon that as being inequitable.

3428. It would, I suppose, be necessary to take some precautions to secure that the cargo which we indemnified was actually coming to this country?—That has always been my personal view of it. I can quite foresee that in order to preserve British shipping it might be necessary to go further.

3429. It would cause a considerable interference with trade as it is ordinarily carried on, would it not, if the cargo owner were bound to declare at the port of sailing what his ultimate port of destination was?—In some trades it would; in others I believe it would not. In the River Plate trade I believe it is very usual to declare the port at Las Palmas. You see, in these long voyages the man who has bought the cargo and is dealing with it wants some time, and as the ship gets nearer he knows how the market is, and whether it will pay him to send it to Rotterdam, or London, or Liverpool, or any of these other ports, because perhaps he can make a little more profit at one port than at another. But the margin of profit on these cargoes, I understand, is so very small that it is necessary to have as much time at one's disposal as possible before giving the orders for the final port of delivery.

3430. On the other hand, if you left it open to him to issue his final instructions at a port of call, of course, the ship would always have been bound for England if she was lost?—I agree, if there is any indemnity of this kind, I should not be quite so keen about the conditions of trade under those circumstances, because when one is at war everything is abnormal, and therefore I should say to a man: "If you intend the cargo for this country, give your orders at the port of loading." I do not think that would be any very great hardship. It might be in individual cases, but I think on the whole it would work well.

3431. Supposing that we have no scheme of indemnity of any kind, what is it you think would happen? Would our shipping be laid up, or would it be transferred to foreign flags?—It would entirely depend on the conditions which were prevalent. If a shipowner in his discretion thought that the war was not going to last very long, he might say: "In the meantime, I am going to lay up my ships for a little while; because I cannot afford to pay the premiums which are asked to insure this risk." But he might, on the other hand, say: "I can get such good freights for trading under these conditions that I am going to risk it." You cannot tell what really would happen. Of course, if one wanted to be quite safe, I have no doubt some of the more timid owners would transfer their ships to foreign flags. Personally, I should deprecate any-

Mr. H. R. Miller. 11 June 1907.

thing of the kind, because experience has taught us that when once you begin transferring your ships you cannot get them back. It is a very simple thing to transfer. At present I know one or two owners who have transferred their ships to the Swedish flag, and they seem to think that the conditions which prevail there are more favourable than the conditions which prevail here, and they do not intend to get them back to the British flag. I should not like that to happen.

3432. (*Sir James Mackay.*) Do they retain their interests in the ships?—Yes.

3433. They simply run them under the Swedish flag?—Yes. You must have an authorised manager, or something of that kind, according to these Continental systems, and therefore you have a trusted agent over there, who is to all intents and purposes the legal owner of the ship; or you form a company, but the capital is supplied by the Englishman, who does the chartering, and buys the bunker coals, and generally manages the ship. It is practically the same sort of thing as if the company were registered here, only it is subject to the Swedish laws, or the Danish laws, as the case may be.

3434. (*Sir George Clarke.*) Do you think a belligerent would recognise a transfer of that class if it were made in time of war? It is not really a transfer at all?—If there was a legal transfer I do not see how the belligerent could help it, supposing I am flying the Norwegian flag, and my ship is a Norwegian ship.

3435. He could help it simply by capturing the ship and ignoring the Norwegian flag?—But the Norwegian Government would surely step in.

3436. (*Chairman.*) You anticipate that in case of the outbreak of a serious naval war, rates of insurance would rule very high?—At first they certainly would, in my view.

3437. Do you anticipate any difficulty in getting ships insured, even at those high rates? Do you think the market would be sufficient to take all the insurance offered?—At the present moment the market is limited.

3438. For war risks?—For war risks. I mean if you instruct your broker to insure war risks to any considerable extent I think you will find that there are only a few companies and a few men at Lloyd's who care to take this risk.

3439. If we were engaged in a big naval war, do you not think that would tempt many other people into that war market?—The more speculative man would, of course, go into it to a certain extent, but the steady underwriter I do not think would touch it.

3440. Would it be too strong a statement, in your opinion, to say that if the State does not insure it may be impossible for the shipping of England to be covered for the whole of this risk?—With English companies, yes. Personally, as conditions prevail at the present moment, I do not see how the whole of the shipping of this country could be covered satisfactorily. You might be able to get a policy; the question is whether, if any very serious losses occurred, the underwriters would be able to pay. If you take an occurrence like the earthquake at San Francisco, that has seriously affected a good many of our companies. I believe shares have gone down in some instances, they have had to call upon their reserve in some cases, and many individual underwriters have paid very heavily. But war risks would be very much more serious than a thing of that kind, and if a risk of that kind has an appreciable effect upon the market, it would be much more serious in the case of war risks. If there were a very few captures of valuable property, if, for instance, for a week or so our Fleet was crippled in any particular way, and a P. and O. boat, a few Cunarders, and a tramp or two were captured, which might happen if the enemy was at all efficient, there would be tremendous losses in that one week, or fortnight, and during that fortnight the premiums would necessarily rise very considerably, and anybody who had held off and not insured would then find it not only difficult to insure, but he would want very good security before he paid his premium. If I might venture to suggest, it might perhaps be desirable, if the State were going to do anything of this kind, to put aside, by way of a sinking fund, so much a year on the declared value of the shipping, to provide a fund for losses.

3441. You would hold, I suppose, that if the fund undertook to give an indemnity, it must pay claims in cash?—Yes, I think so. A man wants to be in possession of his ship or its equivalent at the time of the loss. He wants to be put in the same position as if he insured.

3442. If your scheme were followed as regards the shipping no dispute would arise over the value?—No, it could not; it would be agreed beforehand.

3443. But disputes would still arise as to the value of cargoes?—Yes. The values of cargoes would depend, of course, on the supply and demand to a large extent, I take it.

3444. We have suggested that you might take for the value of the cargo the value at the port of shipment plus freight and insurance?—Yes, that would be a very good plan.

3445. That would seem to you a fair value to take?—A fair value. I should not take it on the valuation as if the cargo were necessarily being shipped to this country. What I want to get at is what is actually the market value in this country, in Rotterdam, in Hamburg, in Havre, or some of these places.

3446. That was the object of the words, that you should take the value at the port of shipment and not the value which that particular cargo might have if it safely arrived in this country at a moment of famine prices. I imagine that still there might be some occasions where disputes would arise. Suppose you had an expert committee to determine any matters under this policy, would you be content to abide by their decision, or would you feel it necessary to leave a shipowner, if aggrieved, an appeal to the courts?—Subject to the constitution of the committee, I should strongly deprecate any appeal. If you have a committee conversant with these matters and capable of judging what the value of shipping and of cargoes is, what possible use can an appeal be? You have already got the best expert knowledge you can get on the subject, and both the shipowners and cargo owners, in submitting to that committee, put themselves under the very best tribunal they can get. What is the object of going to the court? They are only incurring unnecessary cost, wasting time and money and everything else.

3447. I gather generally from what you say that upon the whole you favour the establishment of a scheme on the lines of Scheme A that we sent you?—Yes, I think I favour that more than the other.

3448. (*Sir George Clarke.*) Do you anticipate transfer to a foreign flag to go on on a large scale?—I personally do not believe it would be carried on on a large scale, but what I should like to avoid more than anything would be the possibility of its being carried on on a large scale, because I believe if one or two owners were by any chance successful in their transfer, that is to say, if it worked well, it might induce others to do so, and I should not like that inducement to be held out to anybody.

3449. You mentioned Sweden as a country that would be likely to clothe our ships with its flag. Have you thought of any other countries?—I have not thought of any others. Sweden occurred to my mind, as I knew of some ships that are registered there, although they are practically English ships.

3450. But of course you know that in some countries the laws of the country prohibit such a transfer?—So far as I can understand, the laws of most foreign countries are that you must have a native of that country owning the ship, and I believe that is so in Sweden. I am not quite sure. I believe they arrange it in that way.

3451. And do you suppose that the crews and masters would also be transferred?—Do you mean would become naturalised Swedes?

3452. Yes?—I do not think so. I think they would have to engage a Swedish captain in the boat, or a Spanish captain if it were a Spanish transfer. They might have a man there nominally, but an Englishman would be commanding in fact.

3453. Would the Swedes or Spaniards be able to find crews and officers for any large amount of our shipping?—I am not quite sure whether under these continental laws all the officers must be of the nationality to which the ship belongs. Of course, if there were a large number it would be quite impossible, because the major portion of our mercantile marine are, I presume, Englishmen.

3453*. (*Chairman.*) Do you know anything of the

case of the trawlers that have been transferred to the Norwegian flag in order to evade our fishing regulations?—I do not think I am sufficiently conversant with that.

3454. You do not know whether that is a case where a single Norwegian officer is put on board, but the ship is practically manned as before?—I do not know. I know in Spain they require a Spanish engineer and a Spanish captain. Whether the rest of the officers have also to be Spanish, I do not know. But in a case of that kind it is customary to have a Spaniard who is qualified, and to have a really good Scotch engineer on board the ship as well, who is nominally the second engineer, but really the first.

3455. (*Sir George Clarke.*) If the cargoes of neutral ships were liable to capture owing to the extension of the definition of contraband, would not that reduce the temptation to transfer?—If under a neutral flag they were liable to capture, I suppose that would be so.

3456. Would not that be the case if food and raw materials were declared by an enemy to be contraband?—I suppose it would if they were so declared. The question is whether they would be.

3457. You have said that in war time premiums would be prohibitive. Have you formed any idea of what rates would be prohibitive?—You mean, what would be a prohibitive rate for an owner to pay in addition to his ordinary insurance?

3458. Yes?—That would so much depend upon the circumstances which were prevalent. It would be impossible to say at the present moment what would be prohibitive in time of war. One might have a very big freight in time of war, and out of that might be able to pay a much larger premium than one would be able to pay at the present moment. It would be impossible to sit here and say what would be a prohibitive rate, and what would not. For instance, in the Russo-Japanese war many owners said, "I will not carry your cargo at all unless you guarantee me against loss or give me a suitable policy against it, and pay me the whole freight in advance," which sometimes amounted to nearly the value of the ship. It is obvious that an owner, in order to get a freight of that description, could afford to pay a very substantial sum in the way of war premium. In the case I am mentioning, not only was there a substantial freight, but also the loss was covered which might arise from the capture of the ship, so that it is impossible to say what would be a prohibitive rate until the circumstances are known.

3459. Do you consider there would be probably such an increase of freight that much higher insurance rates than peace rates could easily be paid?—I do not think there would be a material increase in freights. I do not think the market would be very much influenced if there was a proper scheme of insurance in existence. If there was no State insurance, then one would have to do the best one could, and in that case I think the rates would be very much increased. The object of State insurance is to avoid these panic rates having to be paid. It is to keep things more or less normal, not to have these abnormal fluctuations of trade.

3460. The rate would depend on the nature of the war?—Yes.

3461. And who our enemy was?—Yes. For instance, in the Boer War there was no earthly chance of our ships being captured, because they had no ships, and therefore they could not capture us. If one was at war with a great nation that had a very powerful navy that would certainly influence it.

3462. So that these considerations would only arise in case we were at war with a strong naval Power?—They would become prominent then. Of course, one never knows waht may happen even with a small naval Power.

3463. I think you said you see no difficulty in arriving at the agreed value of a ship?—I do not see why there should be any difficulty. I do not say there would be no disagreement as to value. There would be, of course, always some men who would want a higher value than they were entitled to.

3464. Is there any difficulty in finding the true value of a cargo for a particular voyage?—I am afraid I am not sufficiently expert to answer that question. It seems to me more a matter for merchants. I do not see why there should be myself, but, as I say, I am not sufficiently expert. I do not see why there should be any difficulty, any more than there is in arriving at the value of a ship, or any other commodity.

3465. If the State were to lay down in peace time a fixed schedule of rates per voyage, ranging, say, from a ½ per cent. minimum to 2½ per cent. maximum, do you think anything on that basis would be likely to be accepted?—By cargo owners and merchants?

3466. Yes?—You mean a contribution by cargo of a ½ per cent. to 2½?

3467. A premium?—In times of peace to pay that contribution?

3468. No, not in times of peace?—To fix that rate in time of war?

3469. Yes, or rates of about that amount?—If the merchant had to pay a sum varying from 10s. to 2½ per cent. in order to get his cargo here, he would necessarily have to get that out of the price of the cargo somehow or other, and whatever arbitrary sum you fix in the end it would, I suppose, just be a question of increase of prices.

3470. Of course, a contribution of that kind on the value of the cargo bearing some proportion to the distance travelled would get over the difficulty that free indemnity without payment at all must seem to the public at large to be inequitable?—If the cargoes were to contribute during time of war and not during times of peace?

3471. Yes?—It might.

3472. Do you not think that a completely free indemnity would be regarded as exceedingly favourable to a particular interest?—Yes, I think one would have to be educated up to it. I agree to that extent.

3473. Might not the education be a rather long and difficult process?—It might be.

3474. (*Mr. Beauchamp.*) I am not quite sure whether, when you said that you would not give this indemnity to cross voyages, you referred simply to the cargoes?—Yes, I referred only to the cargoes.

3475. And not to the ships?—No.

3476. The ships, under all circumstances, you would cover?—Yes. I think I said that it might perhaps be necessary to give it to the cargo.

3477. Yes. you did afterwards. But, in any case, you think the shipowner ought to be covered under any scheme?—Yes

3478. Then with regard to the insurance question and the limitation of the market for war risks, you said that even now in peace time it is difficult to get a large amount covered?—No, I do not say it is difficult to get it covered. What I say is that the market is limited.

3479. And in that sense it would be difficult to get a large amount covered?—In time of war I think it would be very difficult.

3480. But in time of peace?—No. As I understand —I may be quite wrong—there are certain men at Lloyd's and certain companies who will write these risks when they are put before them, and there are other men who will not. To that extent you would be having all the risks in a confined group of people at Lloyd's and with certain of the companies, and if they had all these risks and a war broke out, obviously it would be a very bad thing.

3481. But is not that rather owing to the fact that the underwriters do not care to tie their hands too much in times of peace at a low premium, in the hope that if war broke out you would come in at a high premium?—It may be. I do not know what the object of the underwriter is in refusing the risk. I should hardly think it is that.

3482. Have you contemplated what might be the amount of captures in any particular war in which this country might be engaged?—Of course I have thought of it, but it would be absolutely impossible to say. My view is either that it would be a big thing or that it would be nothing worth bothering about, because I think if by any chance any important portion of our fleet were crippled, then there would be a large number of captures. If that never happened, there would be very few, and it would entirely depend upon that circumstance, in my view.

3483. I think you said that you thought an eighth per cent. would not be objected to by shipowners

Mr. H. R. Miller.

11 June 1907.

generally?—I do not think it would be objected to generally.

3484. That might be so with regard to tramp owners, but do you think that that would hold good with the great liners?—If the tramp owners agreed to it, I think *a fortiori* the liners ought to.

3485. But would they object, do you think?—I do not think they would seriously object.

3486. An eighth per cent. is rather a serious charge for these big liners. For instance, these two new Cunard steamers cost a million and a quarter each; that would be two and a half millions for those two steamers alone; and even if you charged only a shilling per cent. the premium would be £1,250?—Yes. Then, you see, the risk is very serious, too. If these boats were captured, what would the Cunard Company lose? They would lose the value of their ships, and I do not think an eighth per cent. would be a very heavy premium to charge for that return.

3487. But do you not think they would object in time of peace, considering they can insure their risk for total loss—which is an ever-constant danger, of course—for 17s. 6d. per cent only?—With these risks the value is so large that even if they get ashore, and you spend £30,000 or £60,000 on their repairs, they do not get anywhere near a total loss. It is quite a different thing where a ship is captured. Of course, it is not a big premium, though it may amount in the aggregate on a value like that to something substantial, but the consideration you must take into account is that you have a large sum at risk, and consequently you have a large income from that capital, and therefore you can proportionately afford to pay just as much as the man who has only a ship valued at £40,000.

3488. Quite so, but if they only have to pay 17s. 6d. per cent. for a total loss, which is an ever-constant danger, do you think they would pay 2s. 6d. per cent. for such a problematical thing as capture in case of war?—But do you think that total loss is an ever-constant danger with these big steamers? I think it is exceedingly remote.

3489. (*Sir James Mackay.*) Collision is always dangerous, surely?—Collision is always dangerous, but ships do not sink so much by collision nowadays. With their watertight compartments and that kind of thing the risk of loss by collision is very remote in a ship of that kind.

3490. (*Mr. Beauchamp.*) Still, we have had Cunard losses?—There have been isolated instances, I agree, just in the same way that one may say of the "Berlin," which was a dreadful case of loss of life. But from an underwriter's point of view, I take it that one would accept "Berlins" rather than a coaster which is in and out of port all day long. It seems to me it is purely a question of underwriting, and I do not think the risk of a total loss in one of these Cunarders is at all serious. It certainly would not be written at 17s. 6d. if it were.

3490*. (*Sir George Clarke.*) Their speed is so great that their risk of capture would be very small?—It might be. They have big speeds.

3491. And if their speed was so great that capture would be exceedingly unlikely, ought they to be indemnified if they pay nothing?—But the risk of capture does not depend entirely on speed. If you are not armed, and if you have a shell or torpedo put through you before you have a chance of getting away, as might happen with the long-range guns that are used nowadays, and your engine-room or some vital part was seriously crippled, you would not be able to use your speed.

3492. Speed does materially reduce risk?—I think it reduces it, but where you have an armed ship as against an unarmed ship, if you have a fast cruiser well armed she might be able to keep pace with your Cunarder, and put a shell or two in her when she had a chance.

3493. But you would not indemnify them if the Cunard company had declined to pay this contribution in peace time?—Why should you, if they think their ships are so much better than the rest of the shipping community? What I mean is this: If they think their risks are so much better and so much less liable to capture or seizure than the generality of the shipping community, why indemnify them if they have not contributed?

3494. (*Sir James Mackay.*) You would not make the payment compulsory?—No, I would not make the payment compulsory; but if the Government said "We are going to indemnify every shipowner under this scheme," then surely the shipowner would take advantage of it, because if he did not, then in time of war he would be in a very bad plight if anything serious happened.

3495. Would you say a ship might come in if she had not been paying for fifteen or twenty years?—Any ship that has just been launched must necessarily be treated as from the date of her launch. I would treat it like an ordinary insurance, in the sense that a man who wishes to have his risks covered has a means of covering them by the State; if he likes to come in and accept the provisions that the State has provided for him, let him do so; if he does not, there should be no liability upon the State to refund a loss.

3496. Would you let a man stand out for five or ten years, and then let him come in at the same rate?—No; I should increase his premium very considerably. If you had formulated your scheme from a certain date, and had said "We are going to take these risks," and a man said "I have been outside the scheme for eleven years, and have not insured, but now that war is imminent I will accept," the Government would be perfectly entitled to say: "For so many years there have been so many ships contributing to this fund, and their contribution has been so much." I would not let him come on at ordinary rates; it would not be fair.

3497. Would you allow another owner to come on, supposing there was a transfer?—That would be a difficulty. If that difficulty were insurmountable—if one thought it likely that there would be fraudulent practices arising from it, I should make the insurance compulsory.

3498. (*Mr. Beauchamp.*) If you could make a charge on the cargo owner, you would prefer to have some fee paid by the ship and the cargo?—May I put it shortly in this way? I should prefer a scheme without contribution by the shipowner at all. If you are going to have contribution you must have contribution by the cargo as well, in my view; but the difficulties of getting a fair contribution by the cargo owner are such that I think they would be almost insurmountable. For that reason I prefer a scheme without contribution at all. If you are going to have contribution, you ought to have contribution by the shipowner and by the cargo owner. If you think that by not making the scheme compulsory, the owner might fraudulently transfer his ships and then get the benefit of the scheme, that is very easily got over by making it compulsory.

3499. I understand from the précis that your first idea was that there should be a contribution, and that the contribution should be from the ship and cargo?—No; I am sorry if I have conveyed that idea to you. My idea is that there should be a scheme without contribution at all, but if you have contribution then you ought to arrange some scheme whereby the cargo is brought in.

3500. (*Mr. Lindley.*) You have rather indicated that you would prefer a declaration to be made at the commencement of a given period, so as to fix the value of the ship?—At any arbitrary date, yes.

3501. Supposing you have the gratuitous scheme, is that necessary at all?—I think so, because the Government wants to know what risk it is running as an insurance company, so as to make an adequate provision, even in time of peace, to build up a fund. At least that would be my idea.

3502. You mean from Government revenues?—Yes.

3503. If no declaration is made, then even with the gratuitous scheme you would say that the shipowner is not to be indemnified?—I should make it one of the conditions of his being covered that he should declare his value. I do not see any practical difficulty in the way, because he does, as a matter of fact, declare his value to the underwriter, and where he does not insure, and he has a self-insurance scheme, surely he has some value on which he reckons a rate to put aside premiums to meet losses. In all these cases where owners do not insure, as a matter of business I take it they have an insurance scheme of some kind, and I believe in some instances they even issue policies. If that be so, there should be no difficulty in the way of his declaring the value to the Government, in the same way as he would to his underwriter or to his

self-insurance scheme. There is no practical difficulty in the way.

3504. I wanted to put it that there was no practical difficulty the other way?—The practical difficulty the other way is that if the loss is incurred, the ship is very much more valuable than it was previously, and a shipowner might think that the Government had not sufficiently remunerated him for his loss. In time of war it might be quite true that the ship would be more valuable than it was before. An owner must make up his mind what he is willing to take even in an abnormal time, and if he is willing to go to an underwriter and insure against capture and seizure at a certain sum, that shows the sum he is prepared to take in case of the loss of his ship. Why should he expect the Government to act differently?

3505. With regard to the question of complying with Admiralty control, supposing that compliance were not properly rendered to the Admiralty orders, what do you suggest should be the result?—You mean if the master or owner does not comply with the regulations?

3506. We will take the owner first of all. Supposing the owner does not comply with the regulations, would you say there should be no indemnity?—I should put it upon the same principle as breach of condition in a policy of insurance. If he does not comply with it, why should he expect to be covered?

3507. Supposing the owner complies with it so far as he can and the captain does not, in breach of instructions from the owner, what do you say should be done?—Then I think that ought to be one of the terms of the indemnity.

3508. That it should be paid?—Yes, because he cannot help what happens by the wrongful acts of his servants. The difficulty I foresee there is, that whilst the owner might give precise instructions, the captain might perhaps, on his own initiative, or perhaps on a hint from his owner, act differently.

3509. (*Sir James Mackay.*) Perhaps the captain might think it would be better for the owner that he did not obey his instructions?—These are things that arise in every business transaction. One has to guard against fraud, but if a man is fraudulently intended all the checks you put upon him will not prevent him from committing fraud. In the case of an absolute fraud, where one can prove it, I should treat the owner in the same way as in a civil case. These are all things one has to fight out in ordinary business life.

3510. (*Mr. Lindley.*) What would be the position of the cargo owner under similar circumstances. Would you indemnify the cargo owner in any event?—I would rather not answer that question.

3511. Is not that rather similar to the case of the captain and the owner?—If the cargo is lost by the negligent or fraudulent act of the captain, surely the carrier of the cargo is responsible for it, subject to the clauses of his contract of carriage; and if in time of war the owner felt that he might be liable for some fraudulent act, he could regulate the clauses of his bill of lading accordingly. These are all matters that would have to be considered when the contingency arose; you cannot say so far beforehand.

3512. I was not looking at the question of the responsibility of the shipowner for the value of the cargo, but at what the position of the cargo owner would be?—I think he would have to be put on the same basis as the shipowner.

3513. (*Mr. Huth Jackson.*) You said that you represented the United Kingdom Mutual Steamship Assurance Association?—Yes.

3514. They do not undertake war risks?—No, they do not.

3515. Do you happen to know whether there are any mutual insurance companies who do take war risks?—Yes, there is one.

3516. Do they confine that to the ships and to the cargoes?—Yes, to the ships, not cargoes.

3517. There are none that do cargo?—None that I know of. It may be there are some.

3518. With regard to the value of the steamer for the purposes of this insurance, you would not be prepared to adopt the plan which has been suggested to us of taking the cost less a certain depreciation per annum from the time of her building?—It might be a very good way of arriving at the value of the vessel, because that would probably be the actual value of the steamer; but what I think is this, that there is a slight fluctuation even in the value of steamers. You may have an old steamer which is written down in the books of the firm who own her to about as low a value as they can possibly write her, still she has a market value of some description, and if you sold her you might get a few thousand pounds for her in excess of the book price; and therefore it would not be fair to take the value in the way you suggest, because in the case which I put it might be that the vessel had no value, or that she had been written down to practically nothing.

3519. (*Chairman.*) No book value?—No book value.

3520. Though she had a real value?—Exactly. Suppose you write off 10 per cent. every year, in 10 years time (or whatever period the time is at compound interest), you write off the whole value; you keep on reducing and reducing until you have nothing left.

3521. (*Sir James Mackay.*) If you wrote off 10 per cent. every year you would write her off in about eight years, taking compound interest. That is pretty quick, is it not?—That is very quick. At the end of that period in your books that steamer is valued at practically nothing, but you obtain an offer, let us say, of £7,000 for her, and you sell her; therefore that steamer has a value.

3522. (*Mr. Huth Jackson.*) Supposing one took a more modest percentage than 8 per cent. or 10 per cent.; even then, supposing the ship had been run off, as far as the scheme was concerned, if, as you suggest, there would be liberty to the shipowner to insure outside, he would know exactly what his position was so far as the indemnity was concerned, and he could, I presume, insure that small value which the ship still retained to him outside. I am only wishing to arrive at whether some scheme of that kind would not avoid this annual declaration which you are suggesting?—If I might venture to say so, I think an annual declaration would be more satisfactory to the owners, and I do not see, myself, any practical difficulty in the way of it. It is quite open to the Government to say, "We will give you the value of your steamer as it stands in your books at the date of your loss; you must disclose what you have written down," and so on. But as I have already pointed out, some steamers make more money than others, and some owners write off and some do not, and so many men have different ideas about how business should be conducted that you cannot get unanimity amongst them. Therefore, it is much better to regard it as an insurance risk than as capital at risk in a business concern, and to say to the shipowners, If you are going to insure your vessel against this risk, what value will you put upon it? Then if the underwriter, that is to say, the Government, felt that the value was too low or too high, they would call in the assessors and assess it.

3523. But you suggest there should be no appeal from the decisions of the Board of Claims?—Yes.

3524. It has been suggested to us that if there were no appeal at all the owner of a ship might fall between two stools; the Board of Claims might decide that he has no claim under the war risk policy of the State, and then he would claim on the marine policy, and the Courts of Law might decide that he had no claim under the marine policy?—Yes, of course, that might be, and it is very difficult. The Board might say, This is not a capture or seizure within the meaning of this clause; and then you go to your ordinary policies and the Court might say, This is a capture or seizure within the meaning of this clause; and as you say, you fall between two stools. But surely the risk of that is small, and one has to take some risks in business.

3525. You do not think it is a risk which the Board of Claims should take, that their decision might be upset by a Court of Law?—Is it not rather a question of evidence in each case? Is it not rather a question of fact than of law as to whether your ship has been captured or seized? If it has, in fact, then you recover, and if it has not, you do not. It is mostly a question of evidence, is it not?

3526. The case was suggested to us of a steamer disappearing entirely and being reported missing?—Then it is a question of circumstantial evidence. Of course, these are the sort of risks that a man in business runs every day of his life. He takes out his war insurance policy, he takes out his ordinary insurance

Mr. H. R. Miller.

11 June 1907.

policy, and he falls between two stools. He cannot help it sometimes.

3527. Then he appeals to the Court?—Yes, he has an appeal to the Court. It seems to me it is an ordinary business risk, and I think myself the fear of it is remote. It is simply to get finality. The only object I have in not allowing an appeal, is to get finality, and to prevent unnecessary disputes, and that sort of thing. I think if one had a practical board that understood these matters, you would not have any very great disagreement of opinion, and where the owner was, if I might use a rather vulgar expression, trying it on—entering an appeal to see if he could get anything, but really being not much disappointed if he did not—then I do not think he could complain of the board throwing out his claim. It is a very serious question from the owners' point of view in a really *bonâ fide* case, but I am inclined to think the risk is small of a competent Board throwing out a claim which ought to attach. I do not myself have any fears on that point. You have to submit to somebody ultimately, and whether it is the House of Lords or the Board of Claims does not matter.

3528. You suggested that the initial period of the war would be the one—and that has also been suggested by others—in which the greater number of captures would probably take place?—I should imagine so.

3529. And I suppose you would agree with others that the premium for war risks would probably be greatest during the period just before the war broke out, when there was the fear of war, and also continuously during the earlier period of the war?—Yes, I think that would follow, though one cannot tell.

3530. And assuming, as we all do, that we have confidence in our Admiralty and our Navy to beat any given enemy, then after a certain period the war risk premium might come down to a normal figure?—To more or less what I might call the war normal figure as distinguished from a panic figure. They would not be the same as in times of peace, of course.

3531. No. Of course, if the Navy were not able to defeat the enemy, then there would probably be such a state of confusion that it is horrible to contemplate. But what I was going to suggest to you was, whether there would be a possibility that this guarantee should be for a certain period after the commencement of war?—Why limit it to any certain period? Of course, the insurance ought to be an insurance that would continue during the continuance of the war, because if you are going to limit it to a twelve months' policy renewals would be necessary.

3532. I am talking about the period of the war. The main object is to avoid, if possible, the war risk premiums rising to a very abnormal rate?—And to give security to the shipowners.

3533. Yes; and if, as you have suggested, and other witnesses, too, the period of greater risk of their rising to these abnormal figures would be during the earlier period of the war, would it be possible to contemplate the idea of a guarantee, say, for all ships afloat at the time of the outbreak of war and for all ships sailing within one month or two months after the outbreak of war?—I do not think that would satisfy the owner. He would want fuller cover than that.

3534. You think it would have to be an unlimited guarantee for the period of the war?—I think it would have to be a guarantee for the period of the war, otherwise one would have to resort to ordinary insurance. If you do not get practically the same cover from the Government as you would from an underwriter I do not think it would be worth while considering the scheme. It is quite true the heavier losses would be at the first part of the war, but it is equally true you might have a spurt in captures near the finish of the war, and that would be just as drastic for the shipowners as if it had happened during the first three or four weeks or months.

3534*. You do not contemplate, if the guarantee were given, that there would be any difficulty for other reasons in the owners of steamers keeping their ships afloat do you. I refer especially to the question of crews. There would be a withdrawal of the Royal Naval Reserve would there not?—Yes, I suppose so.

3535. And of a certain number of the foreigners who are at present part of our Mercantile Marine?—If we were at war with any first-class Power, and there were a want of crew, I think there are always plenty of men who would go out on being paid a certain remuneration. I think you would always find sufficient men, apart from the question of the Mercantile Marine at the present moment perhaps being inadequate to meet our demands upon it. Given the same number of men that we have at present in the Mercantile Marine available, and taking out the reserve which is necessary for the Navy, and the foreigners, I think you would find sufficient men, even foreigners as well, who would be willing to go in British ships if Britain were at war, because the wages would be necessarily high. The men who went out in the time of the Japanese War were always quite willing to go out to Japan when they got to Shanghai; the only thing they objected to was the rate of wages. They were quite willing to run the risk of capture, and sometimes they did not mind even running the blockade, but they wanted extra pay. I do not think that difficulty of keeping the ships employed would arise.

3535*. You do not think there would be any great risk of any large portion of our Mercantile Marine being laid up?—I think necessarily a certain portion of our Mercantile Marine would be laid up, because there would naturally, as you say, be a dearth of seamen. But I do not think any very considerable portion would be laid up. I do not think, for instance, it would be 50 per cent. or anything of that kind.

3536. (*Chairman.*) If the annual declaration that you suggest were to be at all controlled by the Government it would involve practically the establishment of a Department to deal with that business, would it not?—I suppose if you had an Insurance Department in the Government, separate from the other departments, to deal with war risks exclusively, it would be part and parcel of their work.

3537. You contemplate that the Government would be obliged to have technical advisers specially for the work?—I think you could have a rota of assessors, in a somewhat similar manner to what they have in the Admiralty Court. When a judge sits he sometimes has two or three assessors to assist him, and you might call upon men who, for a small remuneration, perhaps no remuneration at all, would be quite willing to assess these values where a value was in dispute.

3538. Then you propose that values should be fixed at the beginning of the year?—At some arbitrary date.

3539. The object of that is to prevent an inflated value being put upon the ship after war has broken out, as I understand?—Yes.

3540. You would have, therefore, to cease re-valuation during the period of the war?—I should have no re-valuation during the period of the war. I should ask the owner to make up his mind, in precisely the same way as he does now, what he would be prepared to accept for his ship in the event of that vessel being captured in the next twelve months, because, as I say, the Government would require the information to show them what value they actually had at risk, so that if they felt inclined to start a sinking fund they would have some statistics to go upon.

3541. But suppose I declared the value of my ship on the 1st January and war broke out on the 30th December, on the 1st January following a new declaration would, under ordinary circumstances, be due from me. Would you allow me to vary my declaration if war had broken out in the preceding month, or should I have to stand at the old valuation?—I think it would depend upon whether the value of shipping had very materially appreciated or depreciated during the preceding twelve months. I think you would find that the owners would very fairly agree what the value really was, and that is what one wants to get at. You do not want to get at what is the panic value of the shipping, because that passes in a few months—it terminates with the war—and very probably there might be great depreciation in values after the war. Or, on the other hand, one might be in such a position, through not employing one's ship, that it would very seriously depreciate. But what I would like to get at is, to put a shipowner in the same position as he is at the present day in time of peace. Those owners who do insure against war risks, and they are a considerable number, must of necessity place some value on their shipping in order to get the underwriter to fix the premium, and so forth.

3542. But that value only binds those owners for 12 months?—Only for 12 months.

3543. And, indeed, it does not bind them even, in one sense, to 12 months?—You could always do honour

policies or other policies. Of course, one cannot prevent an owner making a bet with a man.

3544. (*Mr. Llewellyn Smith.*) Supposing you left the value to be determined until the ship is captured, would there not be sufficient data to enable the Board of Assessors to fix its value, apart from the inflated value, but if the value of these 100 ships had to be de so, undoubtedly. I think there would be sufficient data, but to my mind I regard it as a matter of convenience to have all these things fixed beforehand, because then the owner knows what he is going to get and the Government know what they have to pay. As I said before, it seems to me an important matter that the Government should know what risk they are running as an insurance company, in order that they may provide premiums to pay for losses when they occur, or establish some scheme for the raising of a fund, or something of that kind.

3545. Supposing the claims on the Government far exceeded the fund they had been accumulating, they would still pay them, I suppose?—Of course. If they had not accumulated sufficient funds it would simply show they had not charged enough premium.

3546. (*Sir James Mackay.*) You do not propose to charge a premium at all?—That is for the consideration of the Government. I do not mean a contribution by shipowners and cargo owners. I was rather assuming that the Government would be setting aside a sum year by year, which I designate a premium.

Mr. H. R. Miller.
11 June 1907.

3547. A sinking fund out of the general revenues?—Yes, out of the general revenues.

3548. (*Mr. Llewellyn Smith.*) My point is that, supposing there were a hundred ships, of which 5 per cent. were captured, there would be five cases in those one hundred in which we should have to determine the value, but if the value of these 100 ships had be declared every year, in 20 years there would be 2,000 valuations to be made?—Yes, but at the present day, when you insure your ship, you declare your value. I do not know which scheme would be most acceptable to the shipowners. I should think the scheme would be most acceptable to the shipowners which fixed the value when the ship was captured. But one wants to get at a fair and equitable basis. If an owner at the present time is content to say, "In the event of my ship being captured you, the underwriter, will pay me so much," why should he adopt a different view simply because the Government take over that liability?

SEVENTEENTH DAY.

Tuesday, 17th June 1907.

PRESENT:

The Right Hon. Austen Chamberlain, M.P. (*Chairman*).

Sir Thomas Glen-Coats, Bart, M.P.
Sir James L. Mackay, G.C.M.G., K.C.I.E.
Sir George Sydenham Clarke, G.C.M.G.
Sir George H. Murray, K.C.B.
Mr. Edward Beauchamp, M.P.
Mr. Henry Neville Gladstone.
Mr. Frederick Huth Jackson.
Mr. George H. Duckworth (*Secretary*).

Mr. Christopher Robert Nugent, called and examined.

Mr. Nugent, in a preliminary memorandum,* had submitted:—

(1) That the relation of shipowner to Discount houses and Bill brokers in London is chiefly confined to financial operations in connection with ships in course of construction, when it is usual for the builders to take a proportion of the purchase money in cash and the balance in bills at three to six months' date, frequently with the option of renewal.

(2) That the relation of the cargo-owner to the Bill broker is less well defined and is often obscured by the bills involved being drawn upon banks, or other accepting houses, against letters of credit.

(3) That the grant of a State Indemnity would have a favourable effect on business relationships in time of war, and that, with this security, Discount houses would be more disposed to give their usual facilities than if protection were forthcoming only by the ordinary methods of insurance.

(4) That a State Indemnity would nevertheless necessitate large borrowings when National credit was low and money in great demand for war purposes, unless a fund were previously accumulated to meet the claims upon it.

Mr. C. R. Nugent.
17 June 1907.

3549. (*Chairman.*) You are Manager of the Union Discount Company?—Yes.

3550. You have seen the reference to this Committee?—Yes.

3551. We wanted some information as to the position of bill brokers, and the way in which they would be affected, or might be affected, by any scheme of the kind we are inquiring into. Can you tell us, roughly, what is the relation of the bill broker, for instance, to the shipowner?—Between the bill broker and the discount house there is a distinction. The business of the discount market is not entirely a brokerage business. The brokerage business in the discount market is gradually disappearing, and most of the business is done by discount houses—that is, houses which have the handling of a certain amount of money from the bankers and the public generally, which they employ in discounting bills. There is a certain proportion of bills in circulation in the money market which are handled by brokers who are distinctly bill brokers and nothing more, but their transactions are not very important in the matter, and really the principal factor is the action of the discount houses. The discount houses discount bills drawn by the shipbuilders upon the shipowners. I briefly indicated the way in which that business worked on a memorandum which I sent in a few days ago, and really I have very little to add to that.

3552. Would you just give the substance of that memorandum to us to-day?—With pleasure. The relation of the shipowner to the discount houses and bill brokers in London is chiefly confined to financial operations in connection with ships in course of construction, when it is usual for the builders to take a proportion of the purchase money in cash and the balance in bills at three, four, or six months' date, frequently with the option of renewal. The discount houses, in discounting

Mr. C. R. Nugent.

17 June 1917.

such paper, take into consideration the standing both of the drawer (the builder) and the acceptor (the shipowner), and also the general position and outlook of the money market. Should the bills not be properly met at maturity, the broker would come back on the builder, who in turn would be able to recoup himself by seizing and selling the ship. The financial transactions connected with ships after completion of purchase would be by way of mortgage, which is a form of business outside the province of the regular discount houses. The discount houses are subject to the criticisms of the bankers and the people from whom they take their money, because the discount houses have to give collateral security; deposits are all protected by bills, and the public and bankers in taking bills from us naturally look upon them more critically, because in case of emergency they would have to fall back upon the bills if we were unable to find the money. Bills drawn for ships in course of construction are very largely discounted in the open market, in addition to being taken by country bankers and by the large bankers direct from their regular customers. Of course, although the bills are based upon ships in course of construction, we as a matter of fact have no lien upon the ships in course of construction. The fact that such bills arise from shipbuilding is indicated on the bills, and very often the name of the ship is put on, or some number indicating that she is a ship in course of construction, if she has not been named. But we are, above and beyond that, interested in the position of the shipowners, because, having no lien upon the ship, their general credit is a consideration we have to take into account, and in the event of war the losses incurred by a shipowner would, of course, materially affect our position as bill holders, although we were only taking bills based upon ships in course of construction. I do not know whether I have made that quite clear.

3553. I think so. As I understand, the direct interest of the discount houses ceases either when construction is complete or within a few months afterwards?—Yes, that is the orthodox way; but I ought to explain to you that there are a great many bills on ships no longer in course of construction. Some of the largest shipping companies have a large amount of bills in circulation which cannot be recognised any longer as on ships in course of construction. To avoid issuing capital they keep a certain amount of paper in circulation which is discounted by the discount houses and by bankers, and which even finds its way into the Bank of England occasionally as collateral security for loans.

3554. In such cases do you make any stipulation as regards insurance on the ship?—There is a keen competition for this business. There are a great many things you would like to do, and which, strictly speaking, you ought to do, but it is a competitive business, on very close terms indeed, and if I were to suggest to the Chairman of one of these great shipping companies that I should like to see this, that, and the other, he would probably say, "You must be content with the knowledge that we know how to conduct our own business." I should say they would probably insure against marine risks, and probably against war risks. We take it that in the case of a company with ordinary business prudence such things are attended to. We do not make any particular inquiry in such instances.

3555. As regards the cargo owner, will you tell us in the same way what the relation of the cargo owner is to the discount houses?—As regards the relationship between the discount houses and the cargo owner, the exact position is more difficult to define, as the course of the commercial transactions involved is frequently obscured by the resulting bills being drawn upon banks or other accepting houses against letters of credit or other documents; but in a general way it may be stated that the discount houses are largely interested in the satisfactory conclusion of operations entered into by owners of goods coming into or going out of the country. The bills that the discount houses take in that connection are what we call clean bills—that is, they are bills not with the documents attached. The documents are given up on acceptance, and we simply have the engagement of the firm that is financing the cargo owner. Sometimes even shipowning business is done in the same way too.

3556. Your acceptances then are really given on the credit of the firm and not on any documents attached to the bills?—No, it is almost always on clean bills. It is very rare for us to have documentary bills—that is, bills with the documents attached. A very large part of the business is done, especially by the foreign bankers and Indian and Colonial bankers, but the discount houses very rarely take bills with the documents attached, for this reason, that we have to take bills we can circulate and give as collateral security, and the consequence is with documentary bills you must have the bills in your portfolio ready to give up the documents when the acceptor wishes to get hold of his goods.

3557. (*Mr. Gladstone.*) By documents attached you mean documents attached for payment?—Yes. The bulk of our bills are drawn with documents against acceptance.

3558. (*Chairman.*) Then, speaking generally, you would be only indirectly interested in the question which is referred to us?—Quite so.

3559. The more smoothly the shipowner or the cargo owner carry on their business, and the fewer the risks they run, the better it is for you?—Quite.

3560. But substantially you would carry on your business on the strength of their names, without requiring to see whether they were insured or indemnified against risks of this kind?—Of course the general tone of the market would be very much disturbed by any state of war, and probably at such a time the discount houses would be put upon a very keen inquiry as to what arrangements were made to protect shipowners and cargo owners in case of capture. It is possible that the ordinary methods of insurance might not be feasible. It is more than likely, if one or two losses were to take place, that the whole system of insurance would be at an end for the time being, and that it would be difficult to insure, because the risks would be so large. Then, of course, our operations would have to cease in the same way.

3561. You think that underwriters would be scared by two or three big losses?—I think it is very likely. Certainly the companies would. As far as I understand—I am speaking from my own point of view entirely as a layman—the companies are somewhat chary of running the risks, and if they refused to do it the shipowners would be driven to what would be done by the underwriters at Lloyd's, and they might be equally indisposed.

3562. Do you think that the capital behind the companies and Lloyd's is sufficient to underwrite those risks?—That is a question which we should have to consider. I think a great deal would depend on the engagements the houses had in the money market for the time being. A good many questions would enter into our minds when we were presented with that sort of position. But if the engagements of the larger companies were comparatively moderate on discounts, of course we should be influenced by that, whereas if they were large, probably we should be indisposed to do anything.

3563. On the whole, therefore, from the point of view of your own business, you would be glad to see some scheme of indemnity?—Yes. I think it would very much facilitate our operations, and would of course to that extent give shipowners and cargo owners the confidence of knowing that their bills would be discounted.

3564. Any serious restriction in the business you do would, I suppose I may take it, very greatly hamper the ordinary operations of trade?—I do not know whether the discount market can assume quite as important a position as that. You see we are intermediaries: we act between the bankers and these good people who want the money; and the actual money provided by the discount houses is not very large. But there is no doubt the tone of the discount houses influences the credit generally, and the bankers' minds would be influenced by the position if the discount houses were not taking the bills, and I should think the moral attitude would have more effect perhaps than the material one in the transaction.

3565. (*Sir James Mackay.*) Is it not more that the restriction in trade would injuriously affect your business?—It would no doubt affect us in the first instance, and perhaps the others after. We are the outer skin, so to speak, of the money market, and we are very sensitive to any general movements. The profit is infinitesimal, and the discount market is certainly shy directly there is any restriction at all either upon the general or upon the particular position. I might also mention that the discount market is also largely composed of the foreign banking houses who do a similar sort of business, taking bills and buying bills, and their attitude is of some importance in this

question also. The German banks, and the French banks, and the Swiss banks, who are establishing themselves in London very rapidly now, have a very large portfolio of bills, and I know from my own experience they frequently take shipping bills in this kind of way that some of the discount houses would not be inclined to take at all.

3566. (*Chairman.*) Of course any scheme of the kind does not diminish the amount of loss?—No.

3567. It only spreads it?—It only spreads it. That is a point that occurs to one.

3568. It distributes it through the Exchequer over the whole people?—It does. I take the view that it is better distributed perhaps at present among the people who insure the risks than it would be by coming on to the Exchequer, because my own feeling would be that it would entail upon the Exchequer considerable disbursements if the claims were paid in cash, which would come at a very inopportune time, when the national credit was low and money was wanted for war purposes. It occurred to me in thinking of this that, taking the San Francisco disaster, a very large amount was paid in the ordinary way with very little disturbance. If losses of that magnitude had come upon the Exchequer, for instance, at a time when loans would be required for other purposes, it would have been a troublesome matter; it would have a very great effect.

3569. You are inclined to hold, I think, that if the Exchequer is to take this liability it ought to form a reserve to meet it?—I think so, or else to undertake to pay in bonds at the time instead of in cash. I think the country would feel the strain very much, and that the taxpayer might be impatient, considering what he was spending on the Army and Navy, if he were called upon also to provide money for the trade of the country in this way. It might open the door to other people who would be losing by war risks being required to be compensated. It is not only the shipowner and the cargo carrier; there are an immense number of people whose business would be also very prejudicially affected by the outbreak of war, and they insure against such contingencies in the ordinary way. If the State is going to take upon itself the burden of insuring people engaged in the shipping trade, a multiplicity of other businesses would come upon the Government and say, "Let us have a share of this with the shipowner," if it is done without any premium having to be paid.

3570. Do you mean that these other people are insuring themselves against war risks?—Yes, a great many other people. For instance, a banker holding Consols in the ordinary course of business; if war breaks out Consols may fall 10 per cent., and that may mean a loss of hundreds of thousands of pounds. That is as important to him as the loss is to the shipowner.

3571. And it may be as important to trade, and as far-reaching in its effects?—It might be. You enter upon a very large question, it seems to me, when the State undertakes this sort of business.

3572. Looking at the whole question, if you were sitting on this Committee you would probably say we had better not recommend the scheme?—If I were sitting on it I should have had the advantage of hearing all that you gentlemen have heard on the subject. But I should like to hear a good deal to convince me that it was a course to recommend to any Government, unless under the pressure of considerable public demand for such a guarantee.

3573. (*Mr. Huth Jackson.*) The other war risks to which you refer are more or less speculative policies, are they not? They are policies which I think you said were policies taken out against the fall of Consols, and so on?—Yes.

3574. They are hardly legitimate war risks which are run?—I think so in the case of loss incurred in the course of your business which you cannot very well prevent. A banker is as much compelled to hold Consols in the course of his business as the shipowner is to carry by ships, and to that extent he is a creature of circumstance. Of course, the risk is a more speculative one so far as Lloyd's is concerned.

3575. But it is not a risk which in any case of State insurance the State should be called upon to undertake?—I am not so sure. I think there are a great many risks. I merely mentioned that as the first thing that occurred to my mind. But there are a great many other risks where I think the State position would be on all fours, *vis-à-vis* the person requiring protection, as with the shipowners.

3576. But does it not take rather the form of a bet between two parties against war?—Not altogether, I think.

3577. I do not say it is not legitimate, but is not that more the form of it?—I do not think it is so, more than the insurance against risk of capture is a bet that you may be captured or may not. You may escape or not as the case may be. It seems to me to be on all fours.

3578. You mentioned, I think, that the discount market as such were not interested in the insurance of goods under present conditions?—We are interested. I said we did not make particular inquiries when we had acceptances of important houses, and so on. For instance, when we take bills on the various accepting houses, we do not inquire of the accepting houses whether the goods are insured or not.

3579. But the market never does discount documentary bills previous to acceptance, does it?—No. Occasionally, perhaps, while the bills are being accepted we pay cheques drawn against them. Having the goods it is a safer advance than it is by way of a clean bill, where we are in doubt, and where we have nothing to fall back upon but the names if the bill is not accepted. Personally, I would rather advance against an unaccepted documentary bill than an unaccepted clean bill.

3580. Then in time of war the discount market would naturally be put on inquiry to a certain extent as to the insurance?—I think so. Our attitude then would be different from what it is now; it would be more cautious altogether.

3581. And if circumstances arose where, owing to serious losses, the insurance market was refusing to underwrite further war risks, and indeed there was a general feeling that even if they did the policy would not be considered a very strong one any longer, the discount market would be considerably restricted in its operations?—Yes, undoubtedly. That is, of course, a very likely contingency.

3582. And if the discount market were thus interfered with or restricted, it would undoubtedly mean that the business itself would be restricted, because the same arguments would apply to bankers who might be called upon to discount the bills which you were not prepared to take?—That is quite so.

3583. And therefore the discounting and the financing of the bills altogether would become, under the circumstances, a very difficult operation?—Yes, it would be very greatly hampered.

3584. (*Mr. Beauchamp.*) I should like to ask you one or two questions with regard to these other insurances of which you have spoken. Have you in your knowledge any large insurances of that kind having been taken out in the past against the fall of securities?—No.

3585. You have no knowledge that it has been done?—No.

3586. Because, as far as I know, only in very small amounts has that been done from time to time?—But the conditions would be so new in a case where we were likely to be engaged that it would be almost necessary to be done. The losses would be very serious if people ignored some protection of that kind and we became engaged in any war which this guarantee would be likely to affect. This contingency can be limited to four or five Powers however.

3587. You say you would examine the bills and the securities which were offered more carefully during a time of war, before you advanced money on these bills. Have you done that at all when there has been any war scare, such as during the Fashoda incident, for instance? Do you under those circumstances examine more closely and carefully?—Yes, certainly; just as we did recently in the Russo-Japanese War.

3588. And under those circumstances you do not advance so freely without seeing there is other security?—We have to make more inquiries as to the position of the houses interested; what they are doing, and whether their business is likely to be affected very materially by the war conditions, or whether they have protected themselves against these war conditions, and what is the nature of the protection.

3589. To see whether they have insured themselves against the war risks?—Yes. For instance, the revolutionary state of things in Russia has very much affected the credit of all houses dealing with Russia.

Mr. C. R. Nugent.
17 June 1907.

During the last two years the feeling has gone up and down; it gets a little more alarmist at one moment, and a little more confident at another, and the fact that people have been unable to protect themselves against any losses arising out of the disturbed state of things has influenced us in taking the bills. For instance, the fact that people were unable to protect themselves against loss by conflagration in Russia is a very serious matter, with merchants buying cotton and so on, as to the extent of paper we should take on the houses.

3590. Then supposing there should be any indemnity granted by the State, you think it ought to be satisfied by the issue of bonds and not by cash payments?—I should prefer from my own point of view that it should be settled by cash; but from the point of view of the State, I think if you incurred that obligation to find cash you might find it extremely difficult to do it. That is the point that occurred to me. It would be far better, from the point of view of the man who insures, and we who deal with him, that the payments should be made in cash.

3591. Would the bankers be satisfied to advance in the same way, if the payment was to be made by the issue of bonds which could not be realised at the par value?—No.

3592. They would want a larger margin?—Yes, naturally they would. We should look at that very closely.

3593. (*Sir George Clarke.*) I suppose, from your point of view, Scheme A and Scheme B are identical?—Yes.

3594. It does not matter whether the indemnity is free or purchased?—No.

3595. But if Scheme A came into operation you would want to know that a certain value of ship and cargo had been accepted for the purposes of the guarantee?—Yes, we should ascertain that from the person whose bills we were taking.

3596. Therefore there would have to be some transaction as regards the particular ship and the particular cargo between the Government and the person under Scheme A?—Quite. I should look to the shipowner protecting himself in the usual business way by his insurance, whether with the State or anybody else.

3597. You would want to know exactly to what extent he was covered?—Quite so.

3598. I see you say that the State indemnity would necessitate large borrowings, when the national credit was low and money in great demand. Have you ever considered what state of things might arise if a great war broke out?—It is a sort of nightmare, that, when you have a good many millions of other people's money, and a good many engagements on paper, comes upon you every now and then. I get into a fluid state of mind when I consider that subject; I cannot form any concrete notions. It would be very troublesome, and involve us all in very considerable sacrifices and alarm, and so on. There would be a tremendous dislocation in all credit business, and in that connection I may mention that I am one of those who think that the cash reserve is just as important as anything else in these matters; that, especially if there is any form of national guarantee undertaken, you must form a bigger gold reserve, and have a cash reserve. It is the absence or possession of money, as well as food and ships, that is going to handicap you or give you strength when the critical time arrives.

3599. We have had evidence to the effect that if a great war were to break out the financial difficulties would be so great that the mere question of the liability of ships to capture would be a bagatelle. Is that your view?—I rather take that view so far as my own thinking is concerned. I have not discussed it very seriously or to any great length with people, but that is my own feeling. I think if we were engaged in war with a first-rate Power you would have a suspension of the Bank Act, and not only that, but a suspension of the convertibility of the note would follow as a matter of course in a few days.

3600. So that it would be a much bigger question in the event of war than this question of the capture of ships?—I think this is a very important question, but I think the other ought to be included with it.

3601. And the greater includes the less?—Yes; and it is a question which we know the other great Powers have considered. France and America and Germany have provided themselves with an enormous amount of gold they can lay their hands on, which this country has not. Even in comparatively minor transactions we have to borrow gold. We have obtained it hitherto from France, America, and elsewhere. I must say that in the conduct of one's own affairs it is a matter that one takes into consideration.

3602. You think that the lack of gold might really be the crux of the whole question?—I would not go quite so far as that, but I think it would be a very important element. It is one to consider in conjunction with the others. I think perhaps the actual military and naval position would in the first place be predominant, but the other would be almost next to it, and they ought all to go together. That is an expression of my own personal views, with some experience in the money market, and knowing the feeling about matters, especially as London has become so dominant in the money market of the whole world. A monetary reserve would be a good thing to adopt in any case, because it would give greater monetary confidence to the whole world, and enable London to retain its present predominance.

3602*. (*Chairman.*) May I ask exactly in what sense you use the word "predominance"? London does not command the money market of the world?—Perhaps not command. When I use the word "predominance" I mean London is practically the money market, in which transactions centre; the movements of goods all over the world are settled by payments in London.

3603. (*Sir James Mackay.*) It is the clearing house?—The clearing house. That is recognised by the extent to which all the Continental banks and other institutions are establishing offices and businesses in London. It is a very valuable business in itself.

3604. (*Chairman.*) But that makes us not more independent of what is going on elsewhere, but more sensitive?—Naturally more sensitive. I think it is hardly recognised how sensitive we are in that respect.

3605. I thought that must be your meaning, but I was not quite certain?—Yes, that is my meaning.

3606. (*Sir George Clarke.*) But the probability is that the functions of London as the great clearing house of the world could not be carried on in a great war in which we were engaged?—I do not know, and I should not like to say that. I think it could be arranged. So much would depend upon whom we were at war with.

3607. I mean a serious war?—I think, taking the five countries with whom there would be the possibility of our being engaged in a large war, with three out of the five we should be able to continue our banking and monetary business, but of course our markets would be disturbed. It is no good having a supply of food and raw material if you find your markets closed to purchasers. You get congested. The position then becomes absolutely a financial one.

3608. (*Sir George Murray.*) I did not quite follow your reason for thinking that there would be a greater disturbance in the money market if these losses fell in a concentrated form on the Government, rather than were distributed over the whole of the insurance market?—My feeling is that the money would be more easily obtained in the ordinary channels, everybody making their arrangements, and so on, to meet the losses, than it would be by the Government having to borrow one large sum and distribute it again. That is my feeling, and I mentioned in connection with the San Francisco disaster that a large amount of money was obtained apparently with very little disturbance, whereas if that amount of money had had to be raised by the Government, for instance, it would have been a very troublesome matter.

3609. Of course, in that case the losses all occurred in a very few hours. That would not be the case in war?—No; it might be in a few days, though.

3610. Would there not be just as great difficulty, if that money had to be raised in the course of a few days, whether the Government had to raise it or the market had to raise it?—It would cause a considerable disturbance, but I think on the whole we find that distributed arrangements are better than a focussed and concentrated one. I think it would be probably better if the members at Lloyd's and the large insurance companies found the money by selling securities and by borrowing, and so on; it would create less disturbance in the money market than the Government having to issue a kind of stock to raise the necessary funds. You see, the issue of Government stock has a greater effect

in depressing all existing securities than the sales of moderate amounts by bankers and others.

3611. Then you think that the fact that the Government credit is perhaps a trifle better than that of the rest of the world would not affect that?—On the whole I should take that view. I am looking at it from the Government point of view, not from the point of view of the man in the street or the public. From the Government point of view I should prefer, if I were the Chancellor of the Exchequer, having the insurance companies to find this war risk money, instead of knowing at any moment I should have to pay money to A and B for losses that they had incurred from capture.

Mr. C. R. Nugent. 17 June 1907.

3612. No doubt the Chancellor of the Exchequer would prefer that; but I thought you were looking at it from the point of view of the money market?—No. From the point of view of the money market I think they would always prefer cash, and probably a Government guarantee.

Mr. Arthur Norman Hill, called and examined.

Mr. A. N. Hill.

Mr. Norman Hill, in a preliminary memorandum,* had submitted:—

(1) That a National Indemnity in war time is not only desirable but absolutely necessary. The Indemnity to cover all British ships in all trades, and not only those trading direct with the United Kingdom.

(2) That the Indemnity should be gratuitous, since, under any contributory scheme, if the charge were sufficiently low not to divert the trade to neutral ships, it would, in fact, amount to a war tax levied on our oversea trade; while, if it were high enough to cause a diversion of trade, it would defeat one of the main objects of the Indemnity.

(3) That if the Indemnity is to be paid for, the basis on which contributions should be made would be a matter of great difficulty.

(4) That it is of supreme importance to maintain our oversea trade as well as the supply of foodstuffs and raw materials, and that too much might be risked and too little gained by the exaction of contributions towards a State Indemnity.

(5) That the only condition to be attached to the Indemnity should be the observance during war time of Admiralty regulations as to sailing. Shipowners and cargo-owners not to forfeit their right unless personally responsible for the non-observance of these regulations.

(6) That Scheme A affords a better basis for a working scheme than Scheme B.

(7) That losses due to deviation indirectly caused by hostilities should be paid for by the State in order to prevent question as to the liability of underwriters under their marine policies.

(8) That the values on which payment should be made should, in the case of ships, be cost less depreciation at the rate of 5 per cent. per annum; and, in the case of goods, the actual cost plus the actual disbursements made on account of freight, insurance, and similar charges.

(9) That a single Board could not deal effectively with all claims, and that Boards of Claims should be established in London, Liverpool, Glasgow, and Newcastle.

(10) That the members of these Boards should act as representatives of the Government rather than as arbitrators, and that an appeal to a Court of Law from their decisions should be allowed, since a Law Court is a better tribunal than a Board of Claims to investigate fraud.

(11) That the Indemnity should be optional and not compulsory; shipowners not bringing in their vessels under the scheme to be held responsible to the cargo-owner unless the latter had agreed that their vessel should be kept out of the scheme.

(12) That the existence of a scheme of gratuitous Indemnity would prevent any undue increase in freights.

3613. (*Chairman.*) You are the secretary of the Liverpool Steamship Owners' Association, I think?—Yes.

3614. What is the membership of the association?—The members of the association owned at the end of last year 3,600,000 tons of steam shipping. I can give you some particulars of the class of shipping if it is of interest.

3615. I think the figures themselves are almost sufficient. Those are figures of steam shipping?—Entirely steam shipping. The peculiarity of the association is that it holds such a large proportion of the big ships and the fast ships. Last year we owned 37 per cent. of the total number of British shipping afloat of a speed of 12 knots and upwards, and 43 per cent. of the total number of steam vessels above 5,000 tons. It is very largely a liner association.

3616. Your association has considered the question referred to us?—Yes.

3617. And what conclusions have they come to?—They were summarised in a statement that I sent you, a print of a statement made by Mr. Harrison, who was the then chairman of the Association, in October, 1905. I do not think I can add anything to that statement. It was a considered statement adopted by the Association.

3618. And the association have not in any way modified the views they expressed at that time?—No.

3619. The Association therefore desires a State scheme of indemnity against risks of war?—They think it absolutely necessary.

3620. On what grounds do they urge that it is necessary?—On the ground that if the oversea trade is to be carried on effectively, the indemity must be given; the trade can only be carried on effectively under the protection of such an indemnity.

3621. Is that because they think that insurance rates would rise to impossible heights, or because they think they could not get insurance at all?—I do not think there is fear of not being able to get insurance, but the cost of insurance will be such as to disorganise the effective oversea trade of the country. It will not destroy the trade, but it cannot be carried on commercially.

3622. At such a time in case of a serious naval war, there would be great disturbance of trade and of commercial interests in every direction?—Probably.

3623. It would not be confined to shipping?—No.

3624. Do you think that the influence even of a very considerable rise in insurance would under those circumstances be a controlling factor in the market?—The rise of rates to the point which appears to us probable we think would be a very controlling factor. It would affect the whole of our oversea trade, the receipt of the raw material, and the distribution of our manufactures; and there is the other question which we regard as of great importance, the preference it would give to foreign shipping, and the inducements it would offer for the transfer to the neutral flag.

3625. You are seriously afraid of the transfer to the neutral flag?—Yes.

3626. In many countries, perhaps in most countries, at the present time there are legal difficulties in the way of such a transfer?—They can nearly all be sailed round.

3627. Would it be, in your opinion, a mere transfer of registration or an actual transfer of ownership?—The form would be an actual transfer of ownership; but the probabilities are that the original owners would still have some substantial interest in the ship.

3628. In order to make the operation profitable or

* *Vide* note, p. iii.

Mr. A. N. Hill.

17 June 1907.

desirable, of course the enemy must recognise such transactions?—Yes.

3629. Do you think it probable that they would?—We have had a good many examples, not in war time but in peace time, in which such transfers are fully recognised by the country. I might give you an example of when there was a preference shown, from a Customs point of view, to all cargoes imported into the Spanish West Indian Islands in vessels under the Spanish flag. It is notorious that in the case of many of the vessels sailing under the Spanish flag, getting that benefit year after year, the capital in those boats was British. The flag was Spanish, and there was a nominal Spanish owner who discharged all obligations to his State. That trade was carried on year after year in competition with really Spanish-owned vessels in the same trade.

3630. I suppose in that case the Spanish Government for some reason or another were well content to wink at the evasion?—I think they were very glad to get the ships under their flag.

3631. But if the ships were being transferred, say to the Spanish flag, in order to escape the depredations of a strong naval power, do you think that strong naval power would recognise a transfer of that kind in the same way?—It would be very difficult to get behind it, if it was done with all due regard to formalities.

3632. Do you draw any distinction as regards the importance of the two points, the maintenance of our supplies, and the maintenance of our shipping? Do you consider the danger of losing one is greater than the other?—I should put the maintenance of the supplies and the distribution of our manufactures first, and the other as second, but the second is a very important consideration.

3633. I notice you couple the distribution of our manufactures with the maintenance of our supplies of food and raw materials?—Yes.

3634. You naturally regard them as equally important?—Certainly.

3635. Then do you suggest that the indemnity should cover all British vessels in whatever trade they are engaged?—Yes, I think that is necessary to stop the complete disorganisation of our oversea trade.

3636. Including therefore voyages between foreign countries?—Yes.

3637. Although those voyages cannot result in bringing any food supplies to us?—But they affect the cost at which the supplies are brought here most materially. If the voyages are only out and home we may lose very profitable cross voyages on the way, and we shall have to increase the freights out and home.

3638. Would that apply very largely to the liners represented by your Association?—No, it would affect the tramps much more than these liners.

3639. Then I think your association claims that the indemnity should be a gratuitous one?—We think so.

3640. Will you give me your reasons for that?—If the shipowner or the cargo owner purchase the indemnity, then it appears to us that their first effort will be to pass on the cost, the shipowner through the freight to the cargo owner, and the cargo owner through the price to the consumer or the shipper. That could only be checked by effective competition from neutral ships that would carry at less cost, who would not have to purchase the indemnity, and whose insurance would be less than the cost of the indemnity. If that competition of the neutrals is successful, then it appears to us that we are at once brought face to face with the other risk—that is, of the transfer to the neutral flag, if the neutral flag is carrying at substantially less than we can carry, including as one of our costs of carriage the cost of the indemnity.

3641. But supposing that the contribution exacted from the shipowner were so moderate as not to be any inducement to ship in a neutral vessel, then, as you say, the shipowner might pass that on through his freights until it gradually reached the consumer?—Yes.

3642. What is your objection to that?—Then it would really amount, I suppose, to a war tax levied on the oversea trade. It would not matter to the shipowner then.

3643. It would be a war tax levied on the consumers of all the articles brought in or sent out?—Yes, the manufacturers of the articles sent out and the consumers of the articles brought in.

3644. Assuming that that were so, is not that as fair a way of distributing the charge as any that we can conceive?—You have assumed a tax so small as not to interfere with the oversea trade, I take it?

3645. Yes, I have?—Of course, if you have got a tax of that kind it may be a convenient form of taxation.

3646. The loss will be the same under any circumstances, will it not?—The loss will be the same. You cannot avoid the loss.

3647. If the loss falls upon the Exchequer in the first instance, the Exchequer will have to spread it by some form of taxation?—That is so.

3648. Do you think that any tax that occurs to you would spread it more equitably than it would be spread by passing it on to the consumer or the producer?—If I may give a personal example, I live by the transport trade of Liverpool as a lawyer advising the shipping companies; and I think I should escape my share of the contribution if you divide it over the raw material brought in and the manufactured articles sent out.

3649. You would pay something, I suppose, but not perhaps the full amount to which you think you ought to be liable?—I do not think my fees would be reduced because of that special tax. I can conceive of a wider distribution of the tax. It is not a complete distribution over the country.

3650. Your feeling, then, I rather gather, is that those who are specially and directly interested in this trade ought to contribute more than the ordinary consumer. You would of course pay as a consumer in such a case?—I should have thought that the oversea trade was so absolutely essential to our existence that if you talk about the people interested in the oversea trade you really talk about the whole country.

3651. And if the charge is borne *pro rata*, according to his consumption or production, by every consumer and every producer, is there anybody left outside the net?—I am not quite sure how far your distribution would go. If you take Liverpool, Liverpool is a city of middlemen, merchants, commission agents, brokers, underwriters, bankers, and so on. I am not quite sure how, by increasing the price of the articles, you would distribute any part of that war tax over that very large class of people that we have in Liverpool; and of course here in London it is almost as large, I think, if not quite as large.

3652. Have you considered the possibility of putting a small registration tax on shipping, which you would collect in time of peace, with a view to providing a guarantee fund in war?—No. I am sure the Association has never considered it as a body; and I do not think I have ever seen the suggestion myself.

3653. If the State were to adopt a scheme of indemnity, it would of course involve the acceptance by the State of a very considerable fresh liability?—Yes. You mean, if I may say so, by the Exchequer. The nation has got the liability now.

3654. Yes; let me say a fresh liability by the Chancellor of the Exchequer to produce considerable sums at a given moment when, *ex hypothesi*, the demands upon him in other ways would be extraordinary?—Yes.

3655. Do not you think it would be only prudent for him under those circumstances to accumulate a reserve to meet those liabilities?—Yes, I can see the prudence. Of course, you come again against the question of not making it more costly to trade in British ships than in foreign ships.

3656. We have had it suggested to us that a charge of an eighth per cent. on shipping might be made for this purpose. Would that seriously affect British shipping, do you think, in competing with foreign ships?—An eighth per cent. would be a substantial charge on the values, somewhere between £100,000 and £200,000 a year, I suppose.

3657. I should think between £200,000 and £300,000 a year on the total shipping?—Of course, you charge that on the capital value, but it really is a charge on the earnings. From £200,000 to £300,000 a year is a substantial charge on the earnings of the British Mercantile Marine. If it is assumed that the capital invested in British shipping earns 5 per cent., then an annual charge of one-eighth per cent. on such capital would represent an annual charge of 2½ per cent. on such earnings.

3658. As we said earlier, other classes of the community besides shipowners and cargo owners would be suffering great losses at a time of war?—Yes, but if we

are right, subject to this question of losing our trade, by its being transferred to foreign ships, I do not think you would ever get the shipowners to bear any part of the cost of the insurance.

3659. I see; even if we levied on them in the first instance you think they would pass it along?—Of course a small charge like an eighth per cent. would be very difficult to pass on, but if it came to war time I think the chances are that the shipowners would transfer through the freights their burden from the war on to the cargoes that they were carrying, subject to the one holding power of the neutral ship.

3660. Of course, if the charge is of a character to kill the trade, either to cause the shipping to be transferred or to make the price of materials brought in ships prohibitive to the English consumer or manufacturer, that would be a great objection?—Yes.

3661. But if the charge were a very small one, spread over years of peace and not raised in time of war, would that objection apply equally?—No. It would be a question of degree. I think the shipowners would be rather inclined to look on it that if it was a small charge like this it was putting the war cost on them, whilst if you left matters as they are at the present time, and there came the big charge in time of war, they would be able to transfer that charge to their customers. It would be like increasing a tax to the point at which the retailer cannot pass it on to his customer.

3662. Altogether, therefore, you are of opinion that the indemnity must be a free indemnity?—The justification for the indemnity would appear to be that the loss is one which falls upon the country as a whole, and if you are justifying it because it is a loss which the country must face in meal or in malt, the idea of charging any particular industry for it seems to be repugnant to the principle of the indemnity.

3663. You would extend the indemnity to everything in the ships, not merely to necessaries?—We think it would be impossible to distinguish between them.

3664. Do you think it would be quite equitable to distribute the loss, say of a parcel of diamonds, over the whole country?—No. You might exempt certain articles, such as diamonds, which would be at a greater risk of loss.

3665. Would you exempt bullion?—I should have thought we would have wanted all the bullion we could get.

3666. And securities?—It is a very difficult point to answer, because if you are going to try and arrange for our trade in war to be carried on as nearly as possible in the same way as our trade is carried on in peace, if you interfere with any of our cargoes each one is reacting on the other.

3667. That was rather my feeling. That is the answer I was trying to get. On the whole, it would be better to say we must cover everything if we cover anything?—I should have thought so. I should have thought even diamonds. Of course, if a lady was carrying her diamonds across the Atlantic just for the pleasure of wearing them it would be a purely ridiculous thing to cover, but if they are coming as a matter of trade it surely is very important that we should maintain such a valuable trade. They will go somewhere if they do not come here.

3668. You are quite prepared to make it a condition of any indemnity that the ships should follow whatever regulations are laid down by the Admiralty?—Yes; we take that as being the basis of the indemnity.

3669. And in fact that shipowners would be prepared to put up with the restrictions which that would involve?—In consideration of receiving the indemnity?

3670. Yes. Suppose the ship were lost through not following the Admiralty instructions, would you hold the cargo owner indemnified, he being innocent of the breach of the instructions?—Yes, I think he should be held covered. I think in that event the shipowner would be responsible to the cargo owner, if the shipowner has departed from the instructions without the concurrence of the cargo owner.

3671. (*Sir James Mackay.*) What about the terms of the bill of lading?—The shipowner is not responsible for the act of the master?—I think there ought to be two categories, one sailing within the indemnity and one sailing without the indemnity, and if the cargo owner has not clearly agreed to put his goods on a vessel sailing outside of the indemnity, then I think the shipowner should be responsible to him.

3672. That would be a matter of contract?—I think so.

3673. (*Chairman.*) Would you make the shipowner in that case responsible to the cargo owner, and clear the State of responsibility, or would you leave the State responsible to the cargo owner, but give the State recourse against the shipowner?—Your last suggestion would be better for the trade, better for the cargo owner.

3674. (*Sir James Mackay.*) I am afraid the poor shipowner would scarcely care to take that responsibility?—He has got his choice.

3675. He might find himself landed by a captain who had either ignorantly or wilfully disobeyed the orders of the Admiralty, and under that suggestion of yours the owner of the ship would be responsible for the entire cargo?—No, I did not mean to suggest that. I meant to make it perfectly clear that the shipowner who is sailing under the indemnity would not forfeit his right to the indemnity because of the negligence or the misconduct or the stupidity of his servants.

3676. What about the cargo? I thought you said the owner of the cargo should have recourse against the owner of the ship?—If the shipowner does not sail under the indemnity, I would leave it optional to the shipowner to say whether he came in under the indemnity or whether he sailed as he sails now.

3677. Suppose the master of the ship disobeys the orders of the owner?—Then I think the master of the ship is the only person who is responsible to anybody.

3678. Practically you would bring him under the clause of the bill of lading?—Yes. If the shipowner puts the vessel under the indemnity, and himself does not do anything to break the conditions of the indemnity, then I would hold the shipowner covered whatever his servants did.

3679. (*Chairman.*) Would you allow the shipowner to insure against war losses in addition to receiving the State indemnity, or would you forbid any additional insurance against the same risk?—I do not think I should forbid it. I should leave that for him to do as he pleased about it.

3680. Would it not be rather an encouragement to fraud? Supposing a ship were lost, a shipowner might recover the full value of the ship first from the State and again from an insurance company?—A matter of over-insurance; he has insured himself too high?

3681. Yes?—I do not know. I do not believe you can ever stop that kind of fraud by Act of Parliament. I think those cases are the exception.

3682. Certainly the exception, and very rare exceptions I should imagine, but not unknown, I think?—No, they are not unknown.

3683. In the great French war there was a good deal of fraud of one kind and another, not necessarily for this purpose, but in order to carry through profitable transactions which were legally forbidden at the moment?—Yes.

3684. Might not the State find its liabilities unduly increased by a temptation of that kind held out to the shipowner?—I do not know. I do not think shipowners would treat the question as of vital importance. I mean, if it was thought a reasonable condition that any vessel sailing under the indemnity was to be not covered in any other respect, I think they would accept it. As a matter of business, I do not think you would gain very much by imposing such conditions.

3685. On the whole, you prefer a scheme on the basis of what we have called Scheme "A" to anything in the nature of Scheme "B"?—Yes, we think Scheme "A" affords the basis for a working scheme.

3686. Now as to one or two of the details in regard to it. As regards the losses to be covered by the indemnity, are you satisfied with our wording?—The only question is with regard to a loss occurring during a deviation which has been forced on the ship by reason of hostilities or warlike operations, not resulting from either hostilities or warlike operations, but a loss, say, from a peril of the sea, but occurring after there had been deviation. That is, I think, the difficulty in which the shipowner under the present law finds himself. The shipowner who has the two policies, one the ordinary policy and the other the policy against capture, has at the present time the risk of falling between two stools, and that risk we would like to see clearly covered.

Mr. A. N. Hill.
17 June 1907.

3687. (*Mr. Huth Jackson.*) Do you mean the risk of capture or the marine risk?—Whatever loss arises during that period of deviation, whether it is from capture or whether it is from marine perils, unless it is covered under the ordinary policy.

3688. Is it not covered under the ordinary policy?—It is doubtful, I think, if the vessel has deviated from the voyage.

3689. (*Chairman.*) Supposing a vessel were coming across the Atlantic in the ordinary course to Southampton, and in obedience to Admiralty instructions went north about, you would then say that any marine risk from the time she left her course for Southampton to the time she reached her port ought to be covered by the war indemnity?—We think that the war indemnity ought to take what is not covered by the ordinary policy. It is the doubt that we want to see covered.

3690. Suppose that a war policy clearly excluded any marine risk whatever, no matter whether caused through deviation or not, is it not probable that a marine policy would very soon be drawn to cover that?—It would be difficult in a voyage policy on goods to know exactly what clauses to put in to cover that point.

3691. Do you have much dispute under present conditions?—Of course, under the seizure and capture clauses we have not had many disputes for a good time now. But there are many awkward old cases in the books, and if you are called upon to advise a shipowner, whether he is fully covered under his two policies, if he deviates in his voyage, you are in a very difficult position.

3692. (*Mr. Huth Jackson.*) But is not deviation generally covered under a marine insurance policy?—Deviation on an extra payment?

3693. Yes?—Very common, if you put the clause in.

3694. Would it be an impossibility to arrange in a similar way in time of war?—I do not think the underwriters would welcome that. They would show their feeling with regard to such a proposal by putting up their premiums.

3695. (*Mr. Beauchamp.*) Is it not always covered by the deviation clause in every policy?—I should have thought hardly always. It is growing, no doubt.

3696. It is a matter for the underwriter to arrange the premium which is adequate for the extra risk?—Yes; but you have commercial deviation now, which is what we cover under our deviation clause, and you have deviation in consequence of war or hostilities, which might be a very different matter, and the premium which is asked for the deviation under the orders of the Admiralty might really in effect amount to a war risk insurance. In other words, besides getting your indemnity from the State, you would have in all these questions of deviation to pay a war risk premium.

3697. I can hardly conceive the circumstances, but, of course, it is possible?—It is possible.

3698. (*Chairman.*) It might be a war risk premium in the sense that it arose out of the circumstances of war, but it could not be a war risk in respect of the amount of it?—It is probable the amount of the premium would be discussed after there had been a disaster. The clause is that the underwriter and the assured have to agree to the additional premium. It is a difficult kind of clause; it works extremely well in business, but when you have something which neither the underwriter nor the assured contemplated when they made that policy, you have very awkward factors brought into existence, and I do not quite know how they would agree on a reasonable rate.

3699. (*Mr. Beauchamp.*) But as a question of law, if an underwriter charged an unreasonable premium, could not you bring that into a court of law as being unreasonable under the circumstances?—I do not know. A premium to be agreed always goes through, and it is always dealt with fairly as between the underwriter and the assured. But if you come to loggerheads over that, and one party says, "I will only agree to 10 guineas per cent." and the other party says, "That is ridiculous, it should be only 5s.," I do not know how any court is to force those parties to agree.

3700. (*Chairman.*) Take the case I put. Could not you at once check an extravagant claim by showing what was the ordinary insurance against marine risk for a voyage north about?—Yes, I think you would bring evidence, but that does not bear on the question of whether or not the parties have agreed to a particular premium. You would have to say in your clause that it was to be agreed between the parties, or, if they differed, to be fixed by arbitration, or to be fixed by some tribunal.

3701. But substantially there is no greater difficulty than there is in dealing with similar questions in peace time, as you do every day?—Yes. In the ordinary way you have no disturbing factors; the deviation is for business reasons, and made in ordinary seasons of the year by a prudent master and a prudent owner, and he is working with his underwriters and insuring with them year after year, and the whole thing is arranged by the brokers without any trouble. But when you have new factors like war factors coming in, I am not quite sure that that machinery would work so smoothly until we had all got used to it.

3702. (*Mr. Huth Jackson.*) How is the present thing done? For instance, when a sailing vessel comes to Falmouth for orders? She may be ordered as far as Hamburg or anywhere on the Scotland route, up to the north of Scotland?—Her policy would follow her charter probably.

3703. There is no difficulty in arranging different premiums there, is there?—No. We will say the ship takes a charter for Queenstown for orders, and the orders must be within certain limits, between certain ports in the United Kingdom or certain ports on the Continent. She insures that voyage for all those possible endings by her policy, and there would be no deviation at all under that policy; she keeps within the policy whichever of these ports she is sent to.

3704. (*Chairman.*) To turn to values, how would you reckon the value of the ship?—I think if it would simplify matters the value might be taken on the basis of the actual cost to the person indemnified. In the case of ships I would suggest it should be the cost less depreciation at the rate of 5 per cent. per annum, and in the case of goods it should be the actual cost plus actual disbursements made on account of freight, insurance, and similar charges.

3705. In the case of the ship, do you mean the 5 per cent. depreciation to be 5 per cent. on the original cost?—You can calculate it either at 5 per cent. on the original cost or 5 per cent. on the diminishing value. I should think to get a full indemnity the shipowners would be content with 5 per cent. on the original cost.

3706. That would leave a good many ships still running, and certainly likely to be employed if freights rose much, if there was a scarcity of shipping, which would have no value?—No, not many. We have not many that will run for twenty years.

3707. At any rate you think that would be satisfactory and fair on the whole to shipowners?—I think so. They would be quite content. Of course, that brings up the other point you put to me, as to whether you would allow any outside insurance at all. The advantage of taking cost as compared with value appears to be that cost is capable of exact proof. Value is always a matter of opinion. If you took it on the basis of cost less depreciation, and then left a certain latitude to the shipowner at his own expense to cover any special points of value which affected his own particular ship, I think it would be a perfectly fair basis for compensation.

3708. Then for settling claims we have suggested a Board of not less than five members, to be selected from time to time, from a list of persons willing to serve, by the prescribed department. Would that be satisfactory to you?—We would suggest whether it would not be advisable to establish similar Boards, say at Liverpool, Glasgow, and Newcastle, as well as in London, to deal promptly with the claims.

3709. For the sake of dealing promptly with the claims we propose that the decision of the Board should be final. Would you accept that?—We think it would be a mistake to put the Board in the position of arbitrators. We would suggest that the Board should be put into the position of the Board of the insurance company, acting solely for the underwriters, solely for the Government. If you put them into the position of arbitrators you will tie their hands in their manner of investigating the claims. If they are merely acting for the Government they can make what inquiries they please; they can make them through what channels they please, and they can collect their information as they please, and then deal with the claim. If the owner of the ship or the owner of the cargo is dissatisfied with their decision, then we think he should have a claim in law as against the Board or against the Fund.

3710. Of course, if you allow an appeal to the individual you must allow it to the Exchequer also?—Or the Board would reject. The Board can act under the instructions of the Exchequer. The Board can recommend, and the Exchequer can say, "We do not accept your recommendation."

3711. Or suppose the shipper takes the case into court and the court decides against the Exchequer, the Exchequer must be allowed to carry the case up to the higher courts?—Yes.

3712. I suppose the Exchequer has rather a long purse for a litigant?—We are used to that with the underwriters. Some of them have very long purses, and are never satisfied short of the House of Lords. If I might say so, we think that the Law Courts would be a much better tribunal to deal with any cases of fraud than any Board could be, or any informal arbitration.

3713. Then, as I gather, your view is that the shipowner should be free to accept the indemnity with its conditions or not?—Yes, we think so.

3714. But that there should be a presumption in favour of the shipper of cargo that every shipowner had accepted the indemnity unless he expressly declared to the cargo shipper that he had not?—Yes.

3715. (*Sir George Murray.*) Supposing that in the national interest it is thought right to give a free indemnity to cargo, do you think that the claim of the shipowner to a free indemnity stands on exactly the same ground. Could not you, in fact, distinguish between the two?—Not without running very serious risk in the interests of the country, I think.

3716. What interest has the country at large in keeping the shipping afloat?—I should have thought it had every interest in maintaining our shipping. I think our shipping has brought an enormous amount of our trade, and brings it.

3717. But assuming we could get our supplies and send our exports out, has the country at large any further interest in the matter?—I think it has been a very important factor in developing our trade that the home of the ships has been in this country; that they will come back here to end their voyages. If we were doing our transport trade in German ships whose home port is in Hamburg, I think that you would greatly increase the shipping facilities of Hamburg as against the United Kingdom. The home port is a very material factor in providing transport facilities.

3718. Quite so, but supposing that the cargo is brought in and out of the home ports in neutral bottoms, would the country at large have any interest in keeping the British shipowner afloat?—They would not get anything like the same facilities for transport from foreign ships as they would do from British ships.

3719. Is that quite clear?—I should have thought so.

3720. You see the difficulty is that if you are giving a free indemnity to the shipowner you are giving him a preferential treatment as against all other traders in the country. There is no other industry that would have that advantage given it in time of war?—Is it that you are giving him preferential treatment? Is it not that you are stopping him from adding to the cost to the other people in the country of the stuff that is carried in the ship? You cannot devise any scheme by which you would make the shipowner himself bear the extra cost imposed by the war. He will get it back through his freights.

3721. (*Sir George Clarke.*) I think you said that you would extend your free indemnity to all British ships in all trades. Does that apply to Colonial shipping?—I think only if the Colonies were bearing their proper proportion of the indemnity.

3722. That is to say that they would have to pay the indemnity for any losses on their ships?—I think so.

3723. You do not think it would be equitable that the British taxpayer should pay the losses which would fall upon the Colonial owner?—No, I do not think it would be.

3724. And that would have to be separately financed?—I think so.

3725. You say if the charge was sufficiently low not to divert the trade to neutral ships it would become a war tax levied on oversea trade?—Yes.

3726. You might call any tax in time of war a war tax, so that if you did anything at all you would have your war tax?—Yes.

3727. When you speak of British trade in neutral shipping, is there sufficient neutral shipping to take up a large proportion of British trade?—Yes, a very considerable proportion. There are a great many foreign ships seeking trade at the present time.

Mr. A. N. Hill.
17 June 1907.

3728. But I am speaking of a very large scale?—Yes. I am not saying they could take the whole.

3729. Even a proportion might be a very large item?—Yes.

3730. Then you realise that neutral shipping might have to be insured as well as British shipping in time of war?—It would be necessary to insure it.

3731. And therefore the transfer to a neutral flag would be to some extent restrained?—It would be a point to consider in making your estimates, as to how much you could save by running the cargoes in neutral ships, the insurance that the neutral ships would have to pay.

3732. That would be a factor in preventing transfers, by increasing the liabilities of the neutral?—Yes.

3733. Have you formed any idea of the sort of insurance charges which would be so high as to bring about transfers to neutrals?—No, I could not give you any figure. It will not be very much, because of course though a great deal of what you hear is merely talk, if you take the effect of this last Merchant Shipping Act which was carried through last Session, and carried through with the support of the majority of the shipowners, it has no doubt increased somewhat the working expenses of British ships as compared with foreign ships, and you hear people debating most anxiously as to whether they cannot transfer their ships to foreign flags to avoid that additional cost.

3734. I think you say in your paper that indemnity is absolutely necessary. Do you mean from that that trade would stop by reason of the high cost of insurance, or that insurance would stop, and therefore there would not be any insurance?—Not that trade would stop, but that trade would be disorganised by it.

3735. To an extent that you consider would be nationally disastrous?—That is so.

3736. And you also say that if the price to be paid for the indemnity were fixed as a percentage on the value covered, and if this percentage were calculated on the early losses, you would expect that it would far more than cover the losses throughout the whole war. That no doubt is so. But suppose that the cost of the indemnity were fixed on an estimate of the losses during a year, say?—At the end of the year?

3737. Yes, based on such experience of past wars as we have had, and then a system of fixed rates for zones of length of voyage were laid down, to operate all through the war, do you think that would have any possibility of acceptance from your Association?—It comes again to what will the rates be.

3738. Assuming that for the longest voyage, say from London to Australia, the rate was 2½ per cent., would you regard that as prohibitive?—2½ per cent.?

3739. (*Sir James Mackay.*) That would be about 10 per cent. per annum, 2½ out and 2½ home twice over?—Yes, two voyages. It would be a big tax on the trade.

3740. (*Sir George Clarke.*) Would you prefer such a scheme as that to nothing at all?—That we should get the indemnity in exchange for a payment at the rate of 10 per cent. per annum?

3741. That would be in that particular case, a fixed payment for a certain voyage. It would be dividing the world into zones, first ½ per cent., then 1 per cent., and so on, the whole length being made up of the number of zones passed through?—The freights could not stand that.

3742. It would have to be transferred to the freights?—Any such charge as that would have to be transferred to the freights.

3743. Any charge for purchased indemnity would tend to prevent the exaggeration of values, would it not?—I do not know. I should have thought you would have prevented exaggeration by dealing with the basis of cost rather than the value that the man pleases to put on his ship himself. In cases of fraud your premium would not stop fraud. The man who is laying down a scheme to have his vessel captured will not be deterred by having to pay you a few more 2½ per cents.

3744. And the fact that he is paying nothing, and could get any value that he can register might tend to

Mr. A. N. Hill.

17 June 1907.

make those values run up higher?—Yes. I would not give him any value he registered.

3745. I think you said that an Act of Parliament would not check fraud?—No.

3746. But I think you admit that an Act of Parliament might facilitate fraud?—Yes, it might facilitate fraud. I think we know of many Acts which do.

3747. Under your proposals do not you think that war would become exceedingly profitable to shipowners and cargo owners; they have nothing to lose?—No, I do not see how it enters into the question of profit. You want them to do their work in war time as they do it in peace time, for the same pay.

3748. But if there is no loss at all, and no liability to loss, and charges generally, freights especially, are sure to go up, would not there be likely to be very large profits?—You assume that freights would go up?

3749. I do not assume it, but there is a strong probability they would?—Although you have eliminated the risk?

3750. I think there is a strong probability?—No doubt shipowners would do better than they do now.

3751. They would do better in war than they do in peace?—But I think that is an assumption, if I may say so.

3752. It is possible that they might do better in war than they do in normal times of peace?—It is possible that they may do better in 1908 than they have done in 1907, but I do not think it has anything to do with the year, if the circumstances are the same.

3753. The circumstances would not be the same, because war changes so many things that there is exceeding probability that freights would rise, and if all other charges remain pretty much the same, and if there is no liability to loss, there is a possibility that shipowners would do rather well?—Yes. If freights rise and their other expenses do not rise, they will do much better than they do now.

3754. Do you think that the principle of this free indemnity to shipping interests, when there is no compensation for any other interest that suffers in time of war, would be likely to recommend itself to the public at large?—If the public realise that they can pay it in one of two ways, which way they please, and that if they pay it in one way they pay a smaller sum than they pay in another, I think the public would support it, and that is to my mind the only justification for it. If your assumption is right, and they will both have to pay indemnity and pay increased freights in consequence of the risk, then I think the public would be fools to support such a scheme.

3755. (*Sir James Mackay.*) I think you said that in the case of war the trade would probably be disorganised?—Yes.

3756. In what way?—At the present time?

3757. Yes?—I believe there would be a great many vessels laid up to begin with. It is quite common form in debentures of shipping companies to provide that in the event of war the vessels which are given as security for the debenture holders must either be insured against war risks or they must be laid up.

3758. Then you think that the trade to be carried on effectively must be indemnified?—I think so.

3759. And do you think that with an indemnity such as you propose vessels would be enabled to carry on the trade as they do now?—Very nearly, I think. It would depend to a certain extent on these Admiralty regulations—what routes the Admiralty thought they could keep open.

3760. I think you admit that it would be necessary for the Admiralty to stipulate that vessels which were indemnified should obey their instructions?—Yes.

3761. For instance, if a vessel left New York, or Boston, Halifax, Quebec, or Port Said, against the Admiralty's warning that it was unsafe to do so, and was captured or sunk by the enemy, you would not indemnify?—No, unless it was through the negligence or the stupidity of the captain.

3762. But if the vessel were to leave a port where she was safe, say New York or Port Said or Quebec; if she deliberately left the port against the Admiralty orders, would you still indemnify her, although it was the fault of the captain?—You mean the captain wilfully disobeying orders?

3763. Yes; naturally the owner would have the ship under his control if she were lying at a port?—Not every port.

3764. He would in New York, or Port Said, or Quebec?—Yes, in those big ports.

3765. Where the owner can be in effective touch with the captain?—Yes.

3766. Where the ship left one of these safe ports against orders you would not indemnify?—That is really with the owner conniving at the disobedience.

3767. With the knowledge of the owner?—With the knowledge of the owner.

3768. Then you would expect voyages would be fairly safe if the ships proceeded to sea with the consent of the Admiralty?—They should be.

3769. You do not contemplate that the Admiralty would allow vessels to go to sea if it was not safe?—They must to a certain extent. If they want to keep the trade they must take some chances.

3770. But if the Admiralty are to be held responsible for allowing vessels to embark on voyages and the State has to pay for loss, will not the Admiralty be very careful to see that they do not embark on hazardous voyages?—I think it would be a misfortune if they were to be too careful. We want the ships to get through, and the cargoes to get through.

3771. You think they would be fairly careful; they would not allow ships to leave Port Said, for instance, if there was great risk of their being captured or sunk by the enemy?—No, not great risk. We must take chances, or we shall starve.

3772. The Admiralty must take chances?—I think so, certain chances.

3773. Of course they would have great responsibility on their shoulders, would they not?—They have the responsibility now of effectively protecting our ships. It is not only protecting our ships whilst they are lying up in port.

3774. They protect them as far as they can, and no doubt they will continue to do that; but if they are to be responsible for the value of the ships and the cargoes which they allow to go to sea, they will be very much disposed to put restrictions on the voyages. They have no responsibility now?—They have no responsibility now, but they are open to abuse from the shipowner and the cargo owner and the underwriter if anything goes wrong.

3775. They will give warnings, of course?—Yes, but if anything went wrong they would be bitterly attacked. Then they would say, "We took what we thought were prudent chances; unfortunately the ship has not gone through, the ship has been captured; it is a loss of the war, and the country must pay." I should have thought the Admiralty would have felt their hands freer.

3776. If they were responsible?—Yes, if the nation were responsible.

3777. And do you think the trade would be carried on any more freely with the nationally indemnified vessels running under the orders of the Admiralty than it is now, simply with the Admiralty protection, as far as they can give it, without incurring any responsibility?—It is a difficult point you put. Of course you are eliminating all questions of cost of the trade. I should have thought that the trade would not be carried on as freely under the existing conditions as it would be under the indemnity.

3778. Provided the Admiralty take risks?—Yes; simply because the cost of the transport would be so increased that the whole of our trade, or a great part of it, would be disorganised.

3779. Have you considered how many vessels would be likely to be transferred to neutral flags if no indemnity is given, in the event of our being at war with a strong European Power?—No. That must be merely a guess, a guess dependent on how long the war lasts and which is the Power.

3780. Take one of the strongest Powers in Europe?—I could not give you tonnages.

3781. You have not thought of that, perhaps. It would be rather difficult to get the enemy to recognise transfers made during the war, would it not?—I do not think so.

3782. Obviously made for a purpose?—You say obviously made for a purpose, but that is a most difficult matter to prove. The ship is bought and it is paid for.

3783. Suppose a war broke out between this country and a European Power, and a well-known line of steamers—I will not mention any names—was within a month of the outbreak of war transferred to the Spanish flag, do you think that would not be pretty palpable?—A line that had nothing to do with Spain?

3784. Nothing to do with Spain?—May I put another case—not to the Spanish flag, but to the United States flag, and the United States are very proud and very glad to get the line under their own flag. The European Power would think twice before bringing the United States on its back by disputing the validity of those transfers.

3785. Is it quite simple to transfer British ships to the United States?—No; you have to get an Act through Congress, but such things can be done.

3786. You cannot do it without an Act?—No.

3787. It would be rather an unfriendly step for the United States to take towards one of the belligerents, to pass an Act to enable British vessels to be transferred to the United States flag?—I do not know. It is peaceful shipping. There is such a strong cry that peaceful shipping should be exempted from capture altogether.

3788. It would be to deprive the enemy of England of the opportunity of inflicting loss on her?—And very heavy loss on the United States in respect of all the United States cargo which is carried in those ships across the Atlantic. The United States may say, "We are doing this to protect our own cargo, our own exporters."

3789. (*Mr. Beauchamp.*) You think that some scheme of indemnity is absolutely necessary in order that the trade of the country should be carried on. Is that because you think that there would be a large increase of freights, or because the insurance could not be carried on during time of war?—It is freight.

3790. Not insurance?—No. I think the insurance would be found.

3791. You see no reason to anticipate that the insurance could not be carried on in time of war?—No, I think the country is strong enough to commercially do the underwriting of the risk.

3792. You spoke about the Merchant Shipping Act having caused a certain amount of transfer, or the intention perhaps to transfer a certain amount of shipping to a foreign flag. If the capital is not transferred, but only the shipping, do we as a country suffer any harm?—If the home port of the ship still remains here, I do not know that we do suffer any harm.

3793. In the cases that you contemplate, the capital would not be transferred; it would only be a nominal transfer, would it not?—Yes.

3794. And under those circumstances this country would not suffer at all; is that it?—The home port, I think, has a decided tendency to follow the flag. So many States now put in requirements as to surveys and repairs and such things that have to be done under the supervision of the inspectors of the flag. If the shipping is transferred to a foreign flag gradually, the tendency seems to be that the home port comes in that country, the place where she goes home and is discharged, where she finishes her voyage regularly.

3795. But there are cases where English ships do sail under the foreign flag at the present moment. Are their repairs undertaken in the foreign port or in the English port, do you know?—That would depend on the flag. Of course, I cannot admit that there are any English ships sailing under any foreign flag. I agree that there is English capital invested in ships sailing under foreign flags.

3796. But on the East Coast I think there are several fleets of ships which are nominally under the foreign flag, but they are really managed and controlled by English firms?—When you say nominally under the foreign flag, there is an absolute owner of that ship, belonging to the foreign country, who is trusted, and that man can probably do pretty nearly what he pleases as a matter of law. He may have executed mortgages in favour of people who have lent him money, and the rights of those mortgages may be protected, but the foreign subject is the absolute owner of the ship.

3797. But still the management is controlled from this side?—That man is controlled here, but if that man chooses to prove disagreeable, he may make an enormous amount of mischief and trouble.

3798. (*Mr. Huth Jackson.*) You said you preferred Scheme "A"—that is the scheme under which there would be no premium charged—to Scheme "B"?—Yes.

3799. In time of war, do you not think that even neutral shipping would have to pay some premium for war risk?—Yes.

3800. So that if no premium were charged on British shipping and British cargo, that would be an actual bonus in time of war to British shipping?—Yes.

3801. Then I suppose the competition of neutral shipping in time of war would still go on to a certain extent with our shipping in neutral ports?—Yes.

3802. If those neutral ships had to pay some war premiums, they would naturally put that on to the freight?—Yes, if they could.

3803. Do you not think, therefore, that the British ships also sailing from those neutral ports would probably get, at any rate, some portion of the increased freight which the neutral ships had to get?—Yes, that is possible.

3804. So that if there were no premium charged on British shipping they would not only benefit by the absence of the premium, as compared with the neutral ships, but they would also benefit still further by some additional freight which they would be able to secure in competition with the neutral ships?—Yes, that is possible, no doubt.

3805. So that it would be a very considerable bonus?—I do not know what the premium would be on neutral ships. I do not suppose that neutral ships trading here would have to pay anything like the premiums that our ships had to pay in Eastern waters during the late war. They would know that our Navy would play the game, and that they would not sink ships.

3806. But after the experiences of the last war, do you not think the risks to neutrals are considerable?—I hope it is probable that neutrals will not run the same risks in any other war.

3807. You do not think it is likely to be established as a precedent?—I cannot think so.

3808. In any case, whatever the premium was, to that extent it would be a bonus to the shipping?—Yes, it would be, undoubtedly. If you could get at that, and charge that, it would be a fair adjustment.

3809. Would you apply the indemnity to all cargo in British ships, whether it was British owned or not?—I think so.

3810. And would you also apply the indemnity to all cargo in British ships sailing between two outside ports, say, for argument's sake, ships sailing from Buenos Ayres to the Cape. Would you give an indemnity to that cargo as well?—Yes.

EIGHTEENTH DAY.

Tuesday, 25th June 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Mr. H. LLEWELLYN SMITH, C.B.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. ARTHUR LINDLEY.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. THOMAS ESTALL, called and examined.

Mr. Estall, in a preliminary memorandum,* had submitted:—

(1) That, on the declaration of war, ships would be held up until cargo and ship-owners had made arrangements for war insurance that would satisfy bankers and brokers; that conditions would be more onerous than in peace time; and facilities for business would be greatly curtailed.

(2) That the market for war risks would be fairly wide if the Navy is maintained at full strength in comparison with the Navies of other Powers; failing this, insurance would be impossible. That there is no war risk market worth considering outside London, and there is practically no limit to the amount that can be underwritten so long as the business shows a chance of profit.

(3) That prices would undoubtedly increase at least by the amount of the premium charged for war risk.

(4) That a gratuitous indemnity by the State, though no guarantee against capture, would prevent all advance in price due to Lloyd's war risk charges, provided that the Government was prepared to honour its guarantee in the prompt and reasonable way that claims are met on a Lloyd's policy.

(5) That transfer to a neutral flag would be useless, because it would not be recognised by the enemy.

(6) That it would be difficult to satisfy a banker that shipowners and cargo-owners had agreed to the conditions exacted by the State in the event of a National Guarantee, unless the Government issued a policy to which practically no conditions were attached.

(7) That, to satisfy all interests and to provide a document which would be accepted as satisfactory security by bankers, it would be necessary to arrange for collaboration with Lloyd's, and that all claims should be met by Lloyd's as agent for the Government.

(8) That the danger of fraud under a gratuitous indemnity would be very great, since risks would be pressed on the Government that would be refused by Lloyd's, and cargoes would be shipped that were certain to be lost.

(9) That the attitude of a Banker to his customer would not be materially altered in time of war by the existence of a State indemnity, though billbrokers would be obliged to limit their purchases of bills, since they are largely dependent upon the bill-taking banks, and could not purchase to any extent if supplies were not available.

(10) That the present facilities for effecting insurances are so good as in themselves to afford a weighty reason against action on the part of Government.

Mr. T. Estall
25 June 1907.

3811. (*Chairman.*) You are the Joint General Manager of the National Provincial Bank of England?—I am.

3812. You have seen the reference to this Committee?—Yes, I have it.

3813. It occurs to us that it is of considerable importance to know how the outbreak of war would affect the operations ordinarily carried on by bankers and bill-brokers, and through them the commerce of the country. Can you give us any help on that subject?—The inquiry is, I take it, more particularly addressed to insurance and shipping experts than to bank managers. Of course, I need not tell you that shipping and insurance is a matter that except in a very indirect manner a bank manager is not called upon to go into very largely every day.

3814. No, but the operations of the shipping and of the commerce carried in the shipping depend very largely, do they not, on the financial assistance given by the banks?—Yes. Without the finance I do not suppose there would be very much of either done. The outbreak of war would immediately paralyse the movement of ships. On learning of the declaration of war ships would attempt to make a safe port, and the departure of ships in harbour would be delayed until the cargo and ship owners had made arrangements for insurance against war risk, which would satisfy the bankers, brokers, etc. When adequate provision of this nature had been made banking facilities would be available on the customary lines, but the charges would be much more onerous and the extent of the facilities greatly curtailed. That is, of course, a general answer.

3815. But the whole thing depends upon adequate provision being made for insurance against war risk?—Distinctly.

3816. Do you think that the insurance market for war risks is sufficient to undertake the business that would be offered in time of a serious naval war?—Perfectly.

3817. There is sufficient credit behind the underwriters?—Ample.

3818. Do you expect a great rise in premiums?—That would depend to a great extent with whom we were at war.

3819. Assume the case of a really serious war?—A combination, do you mean?

3820. A combination of two great naval Powers?—Yes, I should expect a very considerable rise.

3821. Such a rise as to interfere seriously with business?—Yes.

3822. Suppose we were at war with two great Con-

* *Vide* note, p. iii.

tinental nations, have you in your mind any idea what sort of premiums would be charged for a voyage across the Atlantic, for instance, for corn coming from the United States or Canada?—Are you including America as one of the nations?

3823. No, two European nations?—I do not know; perhaps 15 per cent. It is a guess only, and I should only like it to be considered as a guess.

3824. Would such a premium stop the trade?—No.

3825. But in your opinion it would considerably affect the prices?—It would affect the prices, because, of course, the insurance would have to be effected, and the prices would be affected by the consequent risk.

3826. There would be many other factors also, I take it, tending to increase prices?—Yes. Those who had stocks would take advantage of it, irrespective of whether stocks were here or not. If the stocks were on this side in the hands of the merchants or at the depôts here, they would take advantage of the rise of prices.

3827. It has been suggested to us by some of the witnesses that those other factors would be so powerful that the rise in the premiums for insurance would really be almost a negligible quantity?—Yes, I should think they would be about equal.

3828. You mean that of the rise half might be attributed to the other causes, and half to the immediate war risk?—I should say yes, as a guess.

3829. Suppose that in the first few weeks of war, before our fleet had dealt with the fleet of the enemy successfully, as we hope it would, there were several captures, what would be the effect of them upon the insurance market?—I do not think it would be likely that there would be any captures before the prime issue was fought out. I do not think it at all probable.

3830. Not in the first few weeks of war?—I should think not. I should say the captures would be extremely unimportant in numbers until the first issue with the navy.

3831. At the present day the loss of a very few ships might involve a very great loss to the insurance market—that is to say, the amount at risk in a single ship is now often extremely large?—Yes.

3832. Supposing there were only one or two losses of that kind, few in number but grave in amount, you do not think that that would seriously affect the extent of the market for underwriting?—I do not think that they would be grave in amount, and I do not admit that there would be many.

3833. I think most of the witnesses we have had anticipated that in the early weeks of the war, whatever the strength of the Navy, there must be considerable losses?—I do not think there would be many myself. But that is only my own opinion.

3834. If the losses were not considerable, if there were very few losses in the early weeks of war, the rates would probably fall again rapidly, would they not?—The premium rates, of course, to a great extent, are raised by fear rather than by actual circumstances. It is anticipation rather.

3835. If experience showed that the anticipations of loss were unfounded rates would go down?—Yes, the competition would bring them down.

3836. In the case of the Russo-Japanese war, was there any difficulty in underwriting risks here in London?—Do you mean in the case of the vessels to Russian ports?

3837. Yes?—I do not know about difficulty; it was expensive, I believe.

3838. And I suppose no bank would have given any facilities for the shipment of a cargo unless it was insured, under such circumstances as that?—I should think not, unless the customer asking for it was a very strong man. If they were depending upon the policy only, of course they would not take the risk.

3839. Suppose the Government were to adopt some system of national guarantee or indemnity, how would that affect, in your opinion, the prices of the commodities in our market. Would it serve to keep those prices near the normal?—Anything that kept the insurance market down would, of course, affect the prices.

3840. Would it do more than relieve the prices of the actual charge for insurance. Do you think it would have any moral effect of a steadying kind beyond that?—No, I do not think it would.

3841. So that the maximum advantage to be obtained in your opinion would be that about half the probable rise might be avoided?—Yes, perhaps so. The rise of prices might be kept down if the Government guaranteed to pay the risks above a certain amount, to be decided upon. Say, for the sake of argument, that the risk had become more than 10 per cent., or 15 per cent., or 20 per cent., or any amount that was decided upon, the Government might take the risks beyond that amount. That would not interfere with the general business of the underwriters. That is the only reservation I make. Of course, I need not tell you I am quite against a National Guarantee, but with possibly that reservation.

3842. That would leave the better risks to be underwritten in the ordinary way by the underwriters?—Yes, and not interfere in any way then with the usual business of the underwriters.

3843. But when the risk rose above that point you would advocate a Government guarantee?—Yes, that is the only reservation I would make.

3844. You have told us that unless satisfactory arrangements could be made ships would be laid up. Do you think that many ships would be transferred to a foreign flag?—They could not be transferred, I take it, whilst they were on their voyage. I think there would be very great difficulty in getting the flag changed after a boat had left, and there would certainly be considerable difficulty in getting ships transferred before they left. Of course they need money to transfer them, and they have to be paid for if they have to be transferred.

3845. It is much more easy to do a big financial operation of that kind to-day, is it not, than it was 50 years ago?—Yes, it is. I do not think there would be any great transfer myself. I think with reference to that I have made a note for my own guidance. I say the transfer of ships to a neutral flag need not be feared; it cannot be done whilst on transit, as the vendee must take possession before the capture, and I query whether neutrals could find sufficient capital at such a time for such a purpose.

3846. If the United States were one of the neutrals, I suppose there would be no difficulty in finding the capital?—Well, they have not been overburdened with capital lately.

3847. They have carried out some very big financial transactions?—Yes, I know. We have carried them out, and I think we are feeling all that pretty much now.

3848. I understand your view to be hostile to any scheme of the kind?—Yes.

3849. Supposing, however, that the Government were to decide to recommend the scheme, may I ask you whether, from the point of view of the banker and the house financing the ordinary transactons of commerce, a simple notification that a scheme of indemnity were in force, provided captains obeyed the Admiralty instructions, would be sufficient for you to carry on your transactions?—We should, I think, want to know what the Admiralty instructions were before we valued that which they gave in return for it. You might make your instructions impossible.

3850. The instructions might, I conceive, in particular cases forbid particular routes; they might even go so far as to say that for a time the Mediterranean must be closed?—Of course, the greater the prohibitions the greater the difficulties you put, the less value your guarantee would have.

3851. Would it be essential from the bankers' point of view to have an actual policy of insurance?—Yes; that is the only evidence that we have of insurance. It is the evidence always. We should require a policy, or we should require some distinct evidence as to what the Government were going to do.

3852. Would an Act of Parliament, general in its terms, be sufficient evidence, or would you think there should be a policy relating to the particular ship?—I think I should like my document to relate to my transaction.

3853. And in that case I presume you would require also that the document should state the value for which the indemnity was given?—If I relied on a document I should like to know exactly what I had. I should want it particular rather than general.

3854. It would not be sufficient to know, for instance,

Mr. A. Estall
25 June 1907.

that the cargo would be valued at its value at the port of shipment, plus freight and insurance, without specifying the actual sum?—Then, again, that would come into the question whether the person importing take it *ex*-ship or *ex*-quay. The bulk of the stuff that comes over is sold *ex*-ship, I believe, now. It certainly is in Australia. I believe the amount of consigned wheat from Australian ports to this side is very small indeed. I believe it is all sold before it is shipped. It has become very much more general, I believe, now, to sell before shipment than to sell here. It is obvious that it is so much more to the holders' advantage to sell on the spot.

3855. In such a case, supposing that there was a loss, would it be difficult to prove the amount paid for the cargo?—There would be a great deal of fraud, of course.

3856. Invoices would be loaded, do you mean?—Yes, the wheat might be weevil wheat, or bad wheat, or no wheat. You might pay for wheat, or you might not. There would be a tremendous opening for fraud.

3857. It would be a risky business, would it not?—For the Government.

3858. Also for the fraudulent person, because his cargo might arrive instead of being lost?—Yes. He would take care, probably, that it did not. He might do so. That would be one of the possibilities of fraud.

3859. I do not know whether I need ask you what you think the attitude of the other interests affected by the war, that is to say, of the nation generally, would be toward the offer of a general indemnity to shipping and cargoes?—I think it is a little unfair. To take no other case at all, take my own case; I am holding £100 worth of Consols. Consols go down to 75. Where do I come in? I do not benefit by this. I suffer just as much by the outbreak of war. It applies to everything else.

3860. You would suffer more as an individual if commerce were interrupted?—Everybody would suffer. Everything would suffer, besides shipping.

3861. That is really the basis upon which the suggestion is put by the witnesses who are in favour of it, that everybody has got to suffer in some way?—Yes, but you are proposing to pay some people and not others.

3862. Suppose you have no guarantee, and insurance premiums are high, and prices rise in consequence, that has to fall upon the consumer generally, I suppose?—So would your indemnity. Somebody has got to pay.

3863. It is suggested it would be a more equitable distribution of it if it were done through taxation?—You mean that the man who could be got at best would pay. The regular taxpayer in one case would pay, and in the other case he would not?

3864. Yes?—I daresay it is easier to get at the man who has a settled income than it is to get at the man who has not got any. He does not pay. He would pay in the other case. The national indemnity you would levy on the man who has to pay income-tax, the man who is most easily got at.

3865. I did not say what tax it would be got from—the general taxes of the country. In your opinion the danger of fraud is really very great with any such scheme?—Yes, very great.

3866. Do you think that applies equally to the ships themselves as well as to the cargoes?—No, I should think it rather more likely to apply to the cargoes.

3867. You think it would be easier to ascertain the actual value of a ship?—Yes; it has got a life, and it has got a history.

3868. The form of fraud which you anticipate would be the shipping of inferior goods invoiced at the price of good stuff?—That would be one form.

3869. It is an invidious question to ask, but do you care to suggest any other method?—No.

3870. I ask the question, because so many of the witnesses have ridiculed the idea that any serious fraud would be possible. They admit that of course there is always a certain possibility of fraud in the insurance market, and that undetected frauds do occasionally take place, but so many of them have contended that there would be practically no increase of fraud?—I think more frauds would come as a consequence of there being a Government paymaster than would come as a consequence of the business being done by Lloyd's and the banks, with their ability to detect them because of the existing machinery.

3871. Partly because when it is left to private enterprise there are skilled men dealing with the matter, who might not be available to the Government?—Yes.

3872. And partly, I suppose, because everybody is apt to consider the Government fair game?—Yes. We have seen a good deal of that in the South African war.

3873. There is no alternative, is there, between leaving things as they are and some form of national indemnity?—I think not. The only alternative, I think, is that which I mentioned just now—the payment by the Government when the insurances became abnormal.

3874. Are bankers much interested in shipping afloat nowadays?—No; the merchant is much more than the banker. The Eastern bankers, of course, are very much more interested, the Indian banks much more so than the English banker pure and simple. We are interested, of course, indirectly through them, they banking with us; the merchants bank with us. But the merchants are much more interested than the bankers.

3875. The English bankers are often interested in ships in course of construction?—Yes, very much indeed.

(*Sir James Mackay.*) I think Mr. Estall's answer was more with reference to cargo. You were speaking of ships?

3876. (*Chairman.*) Yes, I was speaking of ships?—My mind was rather on the cargo.

3877. Then, as regard the ships afloat, the banks have very little interest?—Very little.

3878. Their liabilities run off practically as soon as the ship is afloat?—Yes. London bankers for many years have practically made no advances on shipping at all. I am speaking now of ourselves; of course, I know our own business best. We make practically no advances—in fact, I think I may say no advances at all on shipping except in course of construction. A considerable amount of advances is made on shipping in course of construction—that is to say, we discount the bills upon the purchaser for whom the ship is being built, and there are various bills extending over a period of one, two, three, or four years, as the case may be. These bills are freely discounted for the wealthy shipbuilders, and the bankers are certainly considerably interested in them. We are ourselves; we do a considerable business with the large shipbuilders on the Tyne, the Wear, and the Tees. They draw bills, and we discount them.

3879. That part of your business would not be seriously affected by war risks?—No; the vessels are here.

3880. And you would still be able to give credit?—As a matter of fact, the bills should disappear when the vessel is handed over. I do not say that they always do.

3881. They probably would, I suppose, if war were actually in progress?—If not, you would have your acceptor or drawer. If the ship disappears from the building yard before the obligations were paid, you would still have the obligants on your bill.

3882. The operations of those who purchase commercial bills, bills drawn against cargo, would be very much restricted on the outbreak of war, I suppose?—They would be restricted, of course. Others than bankers are restricted as to what the banker is doing. You may take it that purchasers of bills in the discount market are practically dependent on the power of the bankers to re-discount for them. It is obvious that they can only discount directly to the extent of their deposits and their capital, and if you look at the balance sheets of any of the discount companies you will see that the amount of the bills that they rediscount is out of all proportion to their deposits and their capital. It is enormously out of proportion. The consequence is they depend upon the bill-taking banks, and the Bank of England, of course, as a last resource; they do not go there until they have exhausted the other supplies. They depend entirely upon the power of the bill-taking banks when they have exhausted their deposits and their capital.

3883. (*Sir George Murray.*) I think you said that

you would prefer to a scheme of free indemnity a scheme under which the nation would take over all insurance above a certain amount?—That is a reservation to my objection to the whole thing.

3884. Do you think that would be a practical scheme?—I do not think it would be attended with so many difficulties as the whole guarantee, and I think it would tend perhaps to make competition keener between the insurance brokers first, and so tend to keep down the prices. I should not like to give it as a very decided opinion. It is purely an insurance question.

3885. And the arrangement would be, I suppose, that the Government would pay the underwriter all losses above a certain amount?—Yes.

3886. Would that be more equitable, do you think, to the country at large?—I think it would be easier. I do not know that it would be more equitable, I think it would be more workable.

3887. It would have the same objection that you mentioned to the others?—Yes. It is full of objections, I admit. I do not put it forward as an alternative in any way; I merely put it forward to modify a little my total objection to the whole thing.

3888. Then as regards the question of fraud, I did not quite follow why you thought that the Government was so much more exposed to fraud than the insurance companies would be?—They are so much less capable of dealing with questions of this sort. They have not the experience of the insurance companies and Lloyd's.

3889. No, but the assumption would be, I suppose, that they could get expert assistance to enable them to decide on claims?—I daresay they could get it, but when they had got it, I do not think it would be equal to the machinery which has been in existence at Lloyd's for generations.

3890. (*Sir George Clarke.*) Have you considered what the financial effect of embarking on a great war would be upon us; a war in which the issue was not certain, and the expenditure was certain to be enormous?—Do you mean whether it would cause a panic?

3891. Whether it would cause a great panic in London, as we have been told it might?—No, I do not think so.

3892. It has been pointed out to us that the outbreak of war, even when we were not concerned, has generally produced panics of some dimensions in the City, and that therefore on the outbreak of a war in which we were engaged, the panic would be much greater?—What panic followed the outbreak of the last war?

3893. The specific case which has been laid stress on is the war of 1870, which produced a panic in the City. It was not long, but it was considerable while it lasted?—I do not think wars between other nations have produced panic here. You are speaking of the Franco-German war of 1870?

3894. Yes?—The stringency was of very short duration. A good deal of trouble was caused in the Franco-German war; there was a tremendous disturbance, because such an enormous number of Germans left England. At the time of the Franco-German war practically every German gave up his situation and went over. There was a great disturbance; I do not think it was a panic. I do not recollect it as a panic.

3895. (*Chairman.*) It is suggested to us also that very great disturbance was caused by the large withdrawals of gold at that time?—It is a long while back to recollect. I do not know, I am sure; but I do not think so. The probability is that would not happen again, because the amount of gold that the foreign nations have compared with 10 or 12 years ago is extremely large, so that the withdrawal of gold I do not think would be so necessary. I have a note here that the increase of gold of the State Banks of the world since 1894 is £350,000,000, so that the State Banks of the world have during these last 12 or 13 years increased their storage of gold by £350,000,000. The United States, for instance, has £150,000,000 more of gold than it had 12 or 13 years ago. The year 1894 is the date I have taken. England, as a matter of fact, has only £4,000,000 more than it had in 1894. I am taking the State Bank.

3896. Have you any means of knowing how the amount of foreign money in London compares with the same period?—It varies very much indeed. Of course, quite recently we have had the use of some French money in London.

3897. (*Sir James Mackay.*) It depends upon the rate of discount, I suppose?—Yes. If this market is higher, if bills give a better return in this market, the tendency is for French and German money to find its way here.

3898. (*Chairman.*) There is nearly always a very considerable amount of German and French money here, is there not?—I should not think there was very much German money here at the present moment, and not a great deal of French.

3899. (*Sir James Mackay.*) There is a great deal of Japanese money?—A great deal of Japanese. Japanese money here has been, I might say, the disturbing factor. At the same time, it has been most useful to us.

3900. That Japanese money was borrowed from ourselves?—Yes.

3901. (*Mr. Lindley.*) There is a lot of Colonial money here too, is there not?—Yes. The Colonials have been getting exceedingly good prices for their goods, and there is a great deal of Colonial money available. That is why, more particularly on the Stock Exchange accounts, two or three months ago the prices fell, because of the Australian money being lent in the House to the stock market.

3902. You mean for carrying over?—Yes, for carrying over. That was mainly caused by the balances of the Australian banks being large, and they were able to employ the money at the high rate ruling, 4, 4¼, and 4½ per cent., 2 per cent. more than they could get from their bankers.

3903. (*Sir George Clarke.*) The evidence we received about the war of 1870 was that the outbreak of war caused great apprehensions, and the result was one of the biggest panics on the Stock Exchange which the Stock Exchange has ever known. You do not agree with that?—Well, 1870 is a long while back. I cannot recollect the nature of the panic.

3904. And you do not think the amount of foreign money likely to be in London at the outbreak of war, and likely, therefore, to be recalled, would constitute any financial danger?—No, I do not think so. But take Germany, for instance. She has got tremendous use for her money at the present time. Her trade is so very large that I do not think it is likely that for some time to come she will have much money here. France, of course, might have, if her disturbances there were very continuous. French money would then come here; it always does. It came here very largely before the Franco-German war.

3905. Would that money continue to come if we were at war ourselves?—No, I do not suppose it would.

3906. You do not think that we from our position as the commercial centre are more exposed to panic at the outbreak of war than other peoples?—No, I should think possibly France is more so than we are now, by the enormous indebtedness of Russia to her.

3907. You say that there would be delay after war is declared, until the ship and cargo owners had made such arrangements as would satisfy bankers and brokers. I suppose if there were no State insurance in operation that delay would certainly occur at first?—There would be delay in both cases. The Government would not be any more expeditious than the present machinery, nor so expeditious. I should expect them to be very much more slow.

3908. So that in either case there would be a temporary delay until the bankers and brokers were satisfied?—I think that is inevitable.

3909. Have you any idea how long that delay would last?—It would depend so much upon the nations against us, or as to who was against us.

3910. But from that cause alone you anticipate a sudden check to the operations of commerce on the outbreak of war?—Yes.

3911. And if, as the war went on the insurance markets became very restricted, I suppose there would then come another check?—Yes; the more restrictions the greater the check.

3912. I think you said also that the war risk market would depend on the strength of the Navy. You mean, I suppose, on the public estimate of the strength of the Navy at the time of going to war?—The whole thing is

Mr. T. Estell. 25 June 1907.

a question of the strength of the Navy, absolutely. There is no argument about it; the whole food supplies, the whole commerce, and everything, entirely depends upon the strength of the Navy and the number of cruisers capable of protecting our commerce. That sums up, in my opinion, the whole thing. It is all summed up in that.

3913. You think that the initial rates would be settled really by the public estimate of the potency of the Navy?—And performance, of course.

3914. But performance has not come into play?—But the public would see the disposition of the forces at once. Rates would go up immediately, of course.

3915. And afterwards rates would depend upon the results?—Upon the capacity of the country to hold its own.

3916. When you speak of 30 per cent. of losses as making rates too onerous, do you mean 30 per cent. per annum losses?—I put that as a very outside risk, at which business would practically cease.

3917. Of course, the period matters very much?—I take it it would all take place during from three to six months.

3918. But suppose a loss occurred in the first few weeks which was equivalent to 30 per cent. per annum?—I do not think it is possible that it could occur to that extent in the first few weeks.

3919. But if it did, and the loss in the first few weeks was equivalent to 30 per cent. per annum, do you think that would cause premiums to become too onerous?—They would be very high, of course.

3920. And you consider, I think, that if the gratuitous guarantee by the State was agreed to, it would satisfy the bankers and the brokers only if prompt settlement were assured?—Yes.

3921. And you would also demand a document?—Yes, I think so.

3922. There would have to be documentary evidence that the shipper was covered?—I should want to know that there was no possibility of the Government getting away. I do not suppose that they would wish to do so, but I should like to know that my document covered my transaction.

3923. And the amount covered?—Yes.

3924. You also said that a national guarantee would not satisfy a banker unless the policy were issued with practically no conditions?—Yes, I should like a practically unconditional policy.

3925. But the underwriters would probably impose conditions if we left it to the open market?—Yes, I should think so.

3926. And those conditions would probably be to follow the instructions given by the Admiralty?—The ordinary Lloyd's policy, do you mean?

3927. There would probably be special policies, I suppose?—Yes, I suppose there would.

3928. But you would not be quite satisfied with an ordinary underwriter's policy if it involved conditions of that kind?—I should like the Government policy to be at least as good as the Lloyd's policy. I should not like to take a policy which was full of conditions as to routes and cargoes and other things. I take it that you are proposing to offer something rather better by this guarantee than exists. Is not that the idea, that the Government should do something better than a Lloyd's policy under this proposal?

3929. Of course we do not know in the least what a Lloyd's policy would be the moment that a war broke out. I am afraid nobody could tell us that. You noted, of course, in the paper sent to you that both schemes "A" and "B" were to be subject to all the conditions laid down by the Admiralty?—Yes.

3930. Then I think you say that the risks that would be refused by Lloyd's would be pressed on the Government, and cargoes that were certain to be lost would be shipped. But the conditions the Admiralty would have laid down would surely be such as to prevent the certainty of loss?—Then there would be delay.

3931. There would probably be delay, but the certainty of loss, I think, is prevented?—Then there would be great delay, and delay, I think, would be fatal.

3932. On the whole you are decidedly opposed to the State doing anything in the matter?—Very much indeed.

3933. You think that commerce can get on without it?—Quite well; always assuming that the Navy does its work and the number of cruisers and such like are sufficient. It is all a question of the Navy.

3934. Your one exception is that the Government should only come in when the premiums rise above a certain figure?—That is the only reservation.

3935. Would not that have a tendency to force up premiums to the height at which the Government would come in. You would have to settle that at the time. I take it you would not make any hard and fast figures in peace time. You would settle the figure at which you would come in in the time of war.

3936. That would entail great political pressure to fix it, would it not?—No doubt it would.

3937. If there were any form of Government guarantee would you rather prefer that the premium should be paid to the Government than that it should be purely gratuitous?—Do you mean premiums to be paid always?

3938. No, continuously during the war. I think you have said that the gratuitous issue of policies would be unfair to other interests?—Yes.

3939. So that you would prefer, if anything were done, that the insurer should pay a premium to the Government?—It would be more equitable.

3940. (*Sir James Mackay.*) I take it that a very considerable portion of the value of the shipping afloat, especially vessels of not more than four or five years old, must be financed by the money market always. I think you said that banks and discount houses had not very much interest in ships after they were put into the water?—Yes.

3941. But I take it that a great many of the shipbuilders' bills on owners run on for four or five years?—A good many of them. They run on after the vessel has been floated.

3942. So that the money market does have a very considerable stake in the preservation of shipping at sea?—The quantity of bills representing vessels at sea I think is a very moderate proportion of the bills in the market. It is a very small percentage in dealing with the whole total.

3943. Yes, but still I fancy it is a very considerable percentage in the value of ships afloat represented by bills in the money market for the first four or five years of their life?—I should think the percentage is moderate.

3944. You spoke of 15 per cent. insurance premium as what would probably be charged, if we got to war, say, with France and Germany, for goods coming across the Atlantic. Would not 15 per cent. for a voyage across the Atlantic be rather a heavy premium?—Yes, very.

3945. The premium, I take it, would depend altogether upon what our Navy was able to do to the French and German Navy?—Absolutely.

3946. You said two Continental Powers; I suppose you were thinking of France and Germany?—Yes.

3947. If our Navy was able to destroy or bottle up the other two navies, I suppose the insurance premium would be something very moderate?—Very small indeed. I think you may take it that nothing, or practically nothing, would come through the Mediterranean unless we had the entire control of it absolutely. I do not think anyone would risk sending their boats through the Mediterranean, unless they were perfectly certain that the English fleet held the whole of the Mediterranean.

3948. Even in the case of a national indemnity, with vessels running under Admiralty orders, I presume the Admiralty would only allow vessels to leave neutral ports, such as Port Said, provided they were perfectly satisfied the ships would get through to England all right?—Yes; the Admiralty would stop them going through the Mediterranean if we did not hold the Mediterranean.

3949. And so long as the Admiralty were unable to hold the Mediterranean our food supply from India and the Black Sea would not come?—No, it would be absolutely stopped.

3950. Can you give us any idea of the percentage of our wheat and oats and barley that comes from India and the Black Sea?—I should think out of the four-fifths of the food supply for which we depend upon outside sources fully 30 per cent. comes through the

Mediterranean. It is a guess only. I have not statistics or figures before me. I should not be surprised if it were more.

3951. (*Mr. Llewellyn Smith.*) It varies enormously in different years?—Yes. In saying 30 per cent. I should rather be taking an average of perhaps five or six years.

3952. (*Chairman.*) Would the Indian trade necessarily stop if the Mediterranean were blocked. Might it not come round the Cape?—It could, of course. It would take longer, and that would be an important matter, considering that our supply of wheat here is, I think, generally admitted to be about six weeks.

3953. Only at one point in the year?—Do you mean we have more at other times than six weeks' supply?

3954. Yes?—I should take it, as an average, at six weeks. I make out that the supplies are pretty regular.

3955. I think the Food Commission put it at the lowest at three weeks, and that there was a variation between three weeks and three months' supply?—Three months' supply here at a certain period?

3956. Yes, as a maximum?—I think it is a very high maximum. I should take six or seven weeks as the average, because the supplies are so regular.

3957. (*Mr. Llewellyn Smith.*) Are not you speaking of different things. I think the Commission included the whole crop. You are speaking entirely of importation?—Entirely of importation.

3958. (*Chairman.*) I was speaking of wheat in the country, and therefore available?—I was speaking more of imported wheat.

3959. (*Sir James Mackay.*) Then, of course, if our fleet did not hold the North Atlantic and the entrance to the English Channel we might be cut off from America?—Yes. You see the American wheat comes along mostly in August and September. A good deal would depend on the time of year when war was declared.

3960. The Argentine supply would also be cut off?—Yes; the Argentine supply comes along in January, February and March principally.

3961. And so would the supply from the Cape?—Yes.

3962. Therefore if the Admiralty did not hold the Bay of Biscay and the entrance to the Channel, presumably they would not allow vessels to leave, say, New York, or Boston, or Canada, or the Cape, bound for England?—No; they would drop it, I should take it.

3963. Would a national indemnity for vessels and cargoes destroyed in time of war in such an event give us our food supply any better?—No. Whatever indemnity you give does not get the food here. Getting the food here is the whole crux of the thing. You want your food; you do not want an indemnity.

3964. (*Mr. Beauchamp.*) You think that the present insurance market is quite large enough to deal with the insurance problem in time of war?—I do.

3965. That is rather based on the assumption that the captures would not be very large in the early stages of the war?—That they would not be abnormal. I do not think that they would be very large in the early stages of the war.

3966. I do not know whether you have looked at the result of the Naval Manœuvres in the autumn of last year, which were directed to the protection of commerce and to attacks upon commerce. The captures during the first week were very large indeed, were they not?—Yes, they were.

3967. If we had a considerable number of captures in the first week of a war, do you not think the insurance market would dry up; there would be such a panic that they would say they would not take any more risk?—I do not think there would be a considerable number.

3968. But on the assumption that there would be, do you think the insurance market would dry up?—If the captures were very large indeed, I do not think it would dry up, but it would go up very high. The source is so very extensive that I do not think it would dry up. I think it is so very ample for all possible purposes. It would be dear, but I do not think it would dry up.

3969. You think it would still provide all that was necessary?—I do, as long as the Navy and everything else was getting ready for the final issue. I think the final issue would come before the captures were considerable.

3970. Then you think that any system of indemnity would be unfair to the general community?—Yes; I think it is a preference.

3971. And you have instanced the fall that there might be in the price of Consols held by the individual, that they might go down to 75?—Yes.

3972. But the capture would be an absolute loss. The fall in Consols would be temporary, and they would rise again. Therefore, in the one case you have an absolute loss, and in the other you only have a temporary loss?—Of course the credit of the Government would come back again. The results would settle the price.

3973. (*Chairman.*) I suppose you fear you might be ruined in the meantime?—If you wanted to sell. You might have to sit very tight on what you had got or realise your loss. It would depend upon whether it was your money or somebody else's, and what somebody else was going to charge you.

3974. (*Mr. Beauchamp.*) There was a question, supposing an indemnity of some form should be recommended, whether it would be necessary that there should be some document in the form of a policy or something of that kind before the banker advanced his money. I think you said it would be necessary that there should be some document?—Yes, I think so.

3975. Would it not be quite sufficient if there were an Act of Parliament stating that the owner of any cargo liable to capture carried in a British ship should be indemnified?—Without any conditions at all?

3976. Without any conditions?—I do not think Parliament would say so.

3977. That is in the scheme. There would be conditions attached that the captain of the ship should conform to Admiralty regulations?—Of course, if you had an unconditional guarantee, covering anything, the interested parties would have no reason to object, but I do not think it is likely or probable that you would get such an Act passed.

3978. (*Mr. Lindley.*) You were speaking just now of the question of possible panic rises in prices at the commencement of a war. Do you think that the indemnity of the Government, whether paid for or gratuitous, would prevent a panic?—No.

3979. It would have no effect upon it?—Practically nothing.

3980. You mentioned the possibility of fraud, particularly with regard to cargoes. Would not that necessarily imply collusion on the part of the shipowner or the captain?—Not necessarily the captain.

3981. Then the shipowner?—No, I do not know that it would.

3982. How would it be possible for the cargo owner to perpetrate a fraud, we will say, for instance, to provide for the loss of the ship and cargo, without there was collusion?—The cargo might be an indifferent cargo, and the Government would have a claim made upon it for a first-rate cargo.

3983. Would not the captain and officers take good care to see that they did not run into unnecessary danger?—It is quite possible there would be connivance.

3984. I do not quite understand why, in the suggested gratuitous indemnity, no conditions should be attached. If you get a gratuitous indemnity, should not the Government have a right to dictate the terms on which they give it?—Yes, and their having that right would deter a banker from taking it.

3985. That is what I wanted to get your view upon. Have you ever seen a Lloyd's war policy, with restrictions?—I have never read one right through. I take it in bits.

3986. (*Mr. Llewellyn Smith.*) I gathered from your answer to Mr. Beauchamp that you think that, even if your forecast is wrong, and the forecast of some of the other witnesses is right, that at the beginning of the war there would be an abnormal number of captures, still your general view would not be changed?—That is so.

Mr. T. Estall.
25 June 1907.

3987. You think the insurance market would be wide enough?—Yes, I think so.

3988. That is to say, there would be enough people who would be willing to take the risk?—Yes. When I say Lloyd's, I include, of course, the companies.

3989. Yes. They would be the more speculative individuals, I suppose, who would go in for those risks?—They are speculative, of course.

3990. Have you any idea at all of what the amount of the immediately available capital behind that form of insurance would be. I know it is very difficult to give an idea?—I do not know. It is very large.

3991. Do you think it would be very large?—The capital behind Lloyd's as Lloyd's? The capital available for insurance, do you mean?

3992. Available for this form of insurance—available behind the people who would be likely to take it up?—Yes, very large.

3993. Large enough to meet abnormal losses?—Yes.

3994. In fact, you as a banker would not feel any disturbance at the idea that the policies issued would not be honoured?—I should not.

3995. If there was a feeling of that kind among bankers, I suppose it would be very serious, would it not?—I have never heard anyone express that myself. I certainly should have no fear. I never have had any fear.

3996. (*Mr. Gladstone.*) You would select your policies, of course, distinguishing one company from another?—Well, they are all very good.

3997. (*Mr. Llewellyn Smith.*) The suggestion is that you would not be able to select a policy; there would be an enormous number of these risks that would be covered that would be very speculative risks?—I understand.

3998. (*Mr. Gladstone.*) What I mean is that there are certain second-class companies, whose policies you would not take?—I should put it in another way—that there are enough first-class companies, with Lloyd's, to cover them.

3999. (*Mr. Llewellyn Smith.*) Who would not draw in their horns?—Whose resources would be equal to the necessities, I think.

4000. And who, in your opinion, would be likely to go in for that particular form of risk?—Yes, certainly.

4001. The only exception you made was that in the case of very heavy risks there might be something to be said for the Government stepping in?—Yes. I am not strong upon it, but that is as an alternative.

4002. By heavy risks you mean risks above a certain rate, I suppose?—Yes.

4003. You were not speaking of the amount at issue?—No; above a certain rate.

4004. Would the Government fix a rate of premium pretty high, and say "Anything above that we will take"?—I think they should fix it fairly high, so as not to interfere with the proper Lloyd's business, which is in existence always.

4005. They would do insurance business at that fixed rate—10 per cent., or whatever the figure that is fixed?—Yes. I think they should fix it fairly high, and then I think the competition would keep it down probably below that.

4006. The result would be that that would be the maximum to which rates could rise, because anything above that would go to the Government?—Yes, as an alternative. This is only an alternative.

4007. Quite so. Why could not that rate be fixed once for all in peace time? I presume it would be fixed by a consideration of the rise in prices?—If it was in a document I should not mind whether it was done in peace time or war time, only if you did it in peace time you might have to vary it in war time.

4008. Why?—Circumstances might render it necessary. I should see no objection to fixing it in peace time if you elected to do that.

4009. One other exception has been suggested, and that is in the case of ships and cargoes afloat at the outbreak of war. Would you give any indemnity for those, so as to prevent any possibility of panic?—I think if you did the one there would be no objection to your doing the other. The great object is to get the stuff here. That is the point. That is what you want.

Mr. Joseph Paton Maclay, called and examined.

Mr. J. P. Maclay.

Mr. Maclay, in a preliminary memorandum,* had submitted:—

(1) That a national guarantee is probably the cheapest, easiest, fairest, and safest way of meeting war losses, since it would cost nothing in time of peace, and would save the country the expense of war insurance in times of international tension.

(2) That only British vessels bound to and from any port in the Empire, and cargoes on such vessels, should be covered. The responsibility of the State to be limited to such risks as would confer benefit upon the entire community.

(3) That foreign cargoes on board British vessels bound from one foreign port to another should be excluded, since the fear of fraud and the cost of investigating and meeting claims, if these were included, would be out of all proportion to the advantages to be derived.

(4) That the effect of an indemnity would be to concentrate our own tonnage in our own trades, and might even lower freights.

(5) That on the declaration of war the transfer of British vessels should be absolutely prohibited.

(6) That the national indemnity should be gratuitous, and that Scheme A is preferable to Scheme B.

(7) That the conditions to be attached to the granting of an indemnity should include the power of regulating the movements of shipping, but that it should be open to shipowners to remain outside the scheme altogether if they preferred to do so.

(8) That the capacity of the market for war risks to bear a series of heavy losses in the event of a serious war is doubtful.

(9) That a committee of experts could fairly adjust the premiums to the various trades and cargoes according to the risk, should the Government decide that a scheme of insurance was preferable to a scheme of gratuitous indemnity. But that any such arrangement would retard commerce, and entail great labour and inconvenience.

(10) That under an indemnity the parties to be recognised as the owners of the goods in the event of loss should be the holders of bills of lading and original invoices.

(11) That claims should be strictly limited to the loss sustained, and that the value of the ship should be her fair sound value at the outset of the venture, including her provisions and stores, and other disbursements incurred to make her fit for the voyage contemplated. That the value of the cargo should be taken at the prime, or invoice, cost, together with expenses incidental to shipping it, including advanced freight, if any. The value of the freight to be the freight at shipowner's risk at time of loss, minus the cost of earning it from that time.

(12) That the cost of laying up a ship depends on the character of the ship, but that at home, and outside the interest on the capital involved, the cost would be comparatively trifling.

---

* *Vide* note, p. iii.

4010. (*Chairman.*) You are the senior partner, I think, of the firm of Maclay and McIntyre, shipowners, of Glasgow?—Yes.

4011. Do you mind telling the Committee how many steamers your firm owns?—We have forty-one steamers at present.

4012. Trading on any particular routes, or generally?—Not on particular routes, but generally.

4013. In the précis that you have been good enough to send me you mention that you have had some assistance in compiling it?—Yes, from Mr. Fred Gardiner, of Messrs. James Gardiner and Co. I may say we have been interested together in some shipping matters, and we consulted over it, and that is the result.

4014. The views that you are going to give us are the result?—Yes.

4015. First, let me ask whether you think it desirable that the State should undertake to make good to shippers and traders losses incurred through the capture of shipping in time of war?—It is desirable that the State should undertake to make good to shipowners and traders losses incurred through the capture of shipping by the enemy in time of war, with limitations stated hereafter. I incline to adopt, generally, the view as expressed by Captain Inglefield, Assistant Director of the Admiralty, before the Royal Commission. He said, "It appears to me that a national guarantee is the cheapest, easiest, fairest and safest way of meeting war losses. It is the cheapest, because the country would only pay for the actual cost of the losses, and would not, as they would by war premiums, pay several times over for them. It is the fairest, because it would throw the cost on the taxpayers instead of, as war premiums do, doubly on the working classes by means of increased cost of their food.

4016. You are inclined to adopt that view?—Generally.

4017. As regards its being the cheapest alternative, is it not the case that the loss to the country, as a whole, is the same under any circumstances, though the profits or losses of particular individuals may be different?—There is something in the point you make, but it is the cheapest, at least, I think it should prove the cheapest, because underwriters only take risks for the purposes of gain.

4018. It would eliminate their profit?—It would eliminate their profit.

4019. After all, that profit would be made in the country?—To a great extent it would.

4020. But that would be the extent of the saving to the consumer?—I think so, on the face of it. Of course, the great feature would be that the country would realise the safety of the position, and the general trade of the country would not be affected, as I believe it would be otherwise.

4021. There would be a good many factors besides war premiums that would be affecting the trade of the country in time of war?—I think the premiums a minor feature, against the definite position which such a scheme would give.

4022. In your *précis* you suggest another advantage that would attach to such a scheme?—Yes. Another important advantage of a scheme of national indemnity is obvious; it costs nothing in time of peace. In times of international tension the shipowner not infrequently thinks it prudent to cover the risk of war, and this at once influences freights upwards. Under a national guarantee this expense to the country would be obviated.

4023. But the losses which fell to be borne by the nation under such a guarantee would be spread over the whole community, would they not, through taxation?—Undoubtedly that is so, but in the meantime the tax is detrimental to the country. For instance, for many years my own firm insured against war risks year after year, and we had, as a consequence, to charge increased freight.

4024. But supposing the indemnity did not apply to ostrich feathers or diamonds from South Africa, people who wanted a luxury like ostrich feathers could very well afford to pay the extra price which was involved in the extra freight?—It might be, but it means that they have to pay more. Every item that you add to the expense of running the ship means that the shipowner requires increased freight.

4025. Yes, but so far as that charge falls upon articles of luxury like diamonds and ostrich feathers, it would be rather unfair, would it not, to transfer the burden to the general taxpayer?—If you consider that war is brought on not by any act of the shipowner, but entirely for the benefit of the country, by the Government, the position is at once altered. One of the main trades of the country is the shipping trade, and immediately that is affected the whole country is affected.

Mr. J. P. Maclay. 25 June 1907.

4026. You spoke just now of certain limitations which should be attached to any scheme. Would you tell us what they are?—The limitations I would propose are as follows:—That only British vessels bound to and from any port in the Empire (it matters not from what country they come or to what country they go), and cargoes on board of such vessels should be protected against war risks by the British Government. In my view the responsibility of the Government should be limited to such risks as would confer benefit upon the entire community, and it would be impolitic to extend protection to risks which only benefit a section of the community. In other words, I do not think that a good claim could be established that all British ships should be protected in whatever trade they might be engaged, nor do I see that a sound argument could be advanced in favour of protecting foreign cargoes on board British vessels bound from one foreign port to another.

4027. Let me take the first point first. Would not a good many steamers be making round voyages, some portion of which would be between foreign ports? A vessel might leave this country with a cargo of coal, proceed to one foreign port and discharge that cargo then go on to another port, pick up her cargo, discharge that at yet another foreign port, and then perhaps again pick up a cargo which would be brought home to this country?—That very often happens.

4028. Would not your scheme rather break down if you left an unprotected gap in that portion of the round voyage which was between foreign ports?—I do not think I leave any unprotected gap, because if the shipowner is carrying cargo to and from foreign countries, he has an opportunity to cover his own risk, and in the same way the cargo which is carried by the steamer would be covered.

4029. The protection of the guarantee of the State you would confine, therefore, solely to cargoes going to or coming from a British port?—Yes; it matters not where they are going to or where they are coming from; in other words, Empire trade.

4030. On what ground do you exclude foreign cargoes in those vessels?—Because I do not think we have any direct interest in those foreign cargoes. The nation, as a nation, has no interest, I take it, in cargoes going, for instance, from New York to France, or New York to Germany, or vice versa.

4031. No, but I was intending to ask you about your second point, that even in the case of vessels going to or from a British port you would confine the indemnity to British cargoes in those vessels?—I look upon all cargoes coming to our ports as British, in the same way as I look upon all cargoes going from our ports as British. Whatever is for the use of the people of this country under the British flag, to my mind should be covered in coming here, and the same thing in the way of exports from this country. Imports to this country and exports from this country, I think, should be covered, my idea being that as far as possible the normal condition of things should continue to exist here in the time of war.

4032. And for that purpose you think it would be sufficient to cover vessels and cargoes proceeding either from or to a British port?—That is my view.

4033. Ignoring British vessels and the cargoes in them when they were trading between two foreign ports?—That is so.

4034. In that way you hope that the cover given to British ships and the cargoes in them would maintain the freights to and from British ports at approximately their peace level?—I think that is so. In fact, I should think it would be altogether to the advantage of the shipowner who was especially engaged in trades outside of the Empire.

4035. You would expect the freights in the trades outside the Empire to rise?—To be more remunerative than the freights within the Empire.

Mr. J.P. Maclay.

25 June 1907.

4036. Might that not have the effect of tempting the shipowner to those trades rather than to the trades upon which our supplies or exports are dependent?—No doubt it would to some extent, but you cannot get trade sufficient to utilise the British shipping in that way, and my own view is that with such a scheme as this you would certainly not have anything to speak of in the shape of a rise of freights, and possibly there would be a lowering of freights, which would be entirely to the advantage of the Empire. It might not be to the advantage of the shipowner, but I believe it would be to the advantage of the Empire. Then I say here that the only ground on which this could be urged is that it is of vital importance that the British shipping trade should not suffer by war.

4037. That is in connection with the suggestion that foreign cargoes on board of British vessels bound to foreign ports should not be protected?—Yes. But apart from the difficulty of satisfactorily investigating and meeting claims under this wider cover the cost might be out of all proportion to the advantage derived, and further that advantage would attach specially to the mercantile marine and not so much to the general community. If, as I have suggested, the cover is given to British vessels and the cargoes on board bound to and from British Empire ports, then I submit that the freights in these particular trades should not advance materially; indeed, as British vessels would require to cover the war risk whenever they went outside of the limits I propose, it must be obvious that the advance in freights would really fall upon the trades outside those protected by the British Government, and that the tendency would be that such freights would rise very materially while concentration of our own tonnage in our own trades would in point of fact tend to lower these freights. I need not enlarge on the difficulties incident to an insurance scheme on a wider basis, nor do I think it necessary to enter into detail as to the heavy cost that this more comprehensive policy would involve. Anyone conversant with the course of British shipping, and giving due weight to the enormous share we have in the carrying trade, not only for ourselves, but for other countries, will readily appreciate the gravity of the risk indicated. In my view the working of any insurance scheme which embraced all the foreign cargoes carried by British ships in all parts of the world would lend itself to fraud, and any satisfactory check or control over such business seems to be impracticable.

4038. Do you think it would be easy for the Government to protect itself against fraud under a scheme within the limits you have suggested?—I think so.

4039. To ascertain without great difficulty the value of ships lost?—I do not think there is any difficulty.

4040. Or of the cargoes carried?—I do not think there would be any difficulty. Such a course it will be understood would not keep any British owner from carrying goods from countries outside the British Empire, but the owners of vessels doing such trades would run their own risks or insure with underwriters, and have no indemnity from the British Government. This would doubtless mean that there would be a great rise in freights from and to countries which are usually served by British shipping, but the increase of freights would enable owners who desired to continue business outside of the Empire to compensate themselves for the risk.

4041. Would you allow the owner who was engaged in a trade where he got the British indemnity to make an additional insurance against war risks?—I do not see any harm in it. I do not see anything that could be said against it. He would be satisfied, I should expect, with the British indemnity, but he might think of risks outside those that should be covered.

4042. Of course the object of the indemnity is to get the ships and their cargoes here, is it not?—That is the object, to keep the trade of our country as far as practicable in its normal condition.

4043. If it becomes more profitable to lose the ship than to bring it safely home, the temptation to fraud at any rate is increased?—Yes, but I do not think there is much in that. You sometimes hear those suggestions made, but I think the ownership of the country is beyond that. A man might not object to lose his ship; we can conceive of circumstances such as that, but you can conceive of very few shipowners desirous of throwing away their tonnage.

4044. Supposing there were no guarantee of the kind, what do you imagine would happen?—We should require as shipowners to insure our own risks as well as we could, so far as that was practicable.

4045. Do you think there would be much difficulty in doing it at a rate?—I think if the war was a war of any scope at all the difficulty would be to find underwriters. That has been experienced in the past.

4046. And if the shipower failed to find an underwriter you are afraid that he would either lay up his ship or transfer it?—He must have freight proportionate to his risk.

4047. And if he could not get that I gather it is your opinion that there would be a real danger of transfers of British shipping to a foreign flag?—I think so.

4048. Will you give the Committee your suggestions on that point?—I now come to what appears to me of the greatest, in fact, the most vital importance, that with the declaration of war a law should immediately be passed absolutely prohibiting the transfer of British vessels during the continuance of war. Unless such a measure were taken there would be grave danger that our tonnage would be freely bought up by foreigners, and that irreparable damage might be done to the position of the British mercantile marine. It should never be forgotten how the American nation lost its large share in the ocean carrying trade of the world during the time of war. I understand year after year the transference from the American to the British flag went on increasing, and culminated in 1863, in which year between 300 and 400 vessels are said to have been purchased by British shipowners from America and added to our tonnage, and at the close of the war the American fleet, by sale to foreigners, transference to other flags, or capture, had practically ceased to exist, this result being to a great extent brought about by a few cruisers in the hands of the Confederates. The intention to pass such a law would require to be kept absolutely private, as otherwise the American nation, for instance, might see the danger, which to them would be a very real one, because, as already indicated, freights from America to ports outside of the British Empire would go enormously up. To build ships during a short period to supply the need would be impossible, and the American nation and other nations using our ships would be the people to suffer instead of the Britisher during the war. This is all as we would prefer it to be, but I fear that if America got the idea that this country would so act America might even now alter its Tariff Navigation laws, and practically permit the free entrance of all vessels within the flag and grant subsidies. I am one of those who believe that the greatest loss to British shipping at the present moment would come if Americans allowed free trade in ships, and I should dread giving America the opportunity in the time of war of recovering what she lost about 1860 to 1865.

4049. It has been suggested to us that the danger of transference is really very small, that it is very doubtful whether the other belligerent or countries with which we were at war would recognise transfers made under such circumstances. It has been suggested that if they seized ships nominally transferred, or transferred to escape the consequences of hostilities, they would refuse to recognise the validity of the transfer?—Yes, but I believe it would be a permanent transfer. I may be wrong, but my feeling is that America would be delighted to get the opportunity of winning back what she had lost, and I should fear America more than any other country.

4050. And that it would be a *bonâ fide* purchase?—A *bonâ fide* purchase.

4051. You think there would be no difficulty in America buying such a proportion of the British Mercantile Marine as really seriously to affect our mercantile supremacy?—I do not think there would be any difficulty. There are lines we could think of which I think without difficulty could be transferred to America.

4052. Have you in contemplation that the State should give its indemnity without payment?—That is the view I adopt, and I believe it is the most favourable to the State.

4053. Would you be prepared, if we thought it right to recommend that as a condition, to make some contribution in order to receive such an indemnity? It has been suggested to us, for instance, that one-eighth of one per cent. would be a fair charge to put on ship-

ping?—It is a very trifling figure. I think there is a principle at stake here, and I am working it out on principle.

4054. Your principle being that the risk is incurred through the action of the State, and that the State ought, therefore, to guarantee the individual against loss arising through it?—Yes. I might say this, that as a shipowner with a number of ships I think I would prefer to be without any insurance, purely from a speculative point of view. I believe in time of war many large shipowners could do very much better for themselves than under such a guarantee as this.

4055. You mean that they would recover in freights more than the extra charge they paid in premiums?—I think a great deal more.

4056. But that is subject to the qualification you made just now, that you doubt whether they would be able to insure?—I speak from my own personal standpoint, but I do not think it would be good for the nation. All owners of British ships are not in the same position. You can understand a great proportion of the Mercantile Marine of this country is held by men who have one, two, or three ships, and they would never have the same position that a large company would have. I speak here wholly from the national point of view.

4057. I think you are prepared to agree that if the State gives such a guarantee it must retain power to regulate the movement of shipping?—Yes, that is so.

4058. But you would allow owners who would like to take risks forbidden by the State to proceed at their own risk, insuring themselves if they could in the market?—Certainly, so long as it was not to the detriment of the country.

4059. You suggest in the *precis* that you sent me that another condition should be that the Government would have power to restrict the character of any cargo put on board ships in time of war. What have you in mind there?—Such things as you, Sir, yourself indicated—diamonds, and ostrich feathers, and such things. If there was a serious risk at the time it would be desirable to restrict the ships as to the articles they carried.

4060. Articles which it was not urgent for this country to receive, or where the risk in a small parcel was so heavy that it would not be wise to enter upon it?—That is what I mean.

4061. You have already told me that you think a scheme for a free indemnity is the right one?—That is so.

4062. If, on the other hand, the Government decided that some premium should be paid by the shipper, have you considered the possibility that Government might intervene and say that when the risk passed a certain point they would assume it, leaving all risks estimated by the ordinary sources as being below that point to be taken in the ordinary way?—I have not considered it from that standpoint. It seems to me the Government should either do the one thing or the other.

4063. Do the whole or nothing?—The whole or nothing.

4064. Then as regards the cargoes. I think it has occurred to you that there might be some difficulty in finding out whose cargoes they were?—I do not think there is any difficulty about that. The position is one we are dealing with every day. We deal with the man who produces the documents. A bill of lading is the equivalent of a bank note.

4065. You treat the holder of the bill of lading for the time being as the person entitled to receive the indemnity?—That is the basis on which the business is worked.

4066. If there were no scheme in existence, and if you were right in supposing that the shipowner might have a difficulty in insuring his risks in the market, I suppose he would have to lay his ship up?—Or run his ship at his own risk.

4067. What is the cost of laying a ship up. Is it impossible to give a general answer to that question?—I do not think so. It depends on the character of the ship. Generally speaking, however, outside the interest on the capital involved, the loss is comparatively trifling, as even large ships can be kept in order, while laid up for a considerable period, by a very few men. Of course, if ships were laid up in foreign ports, and obliged to keep their crews on board, then the cost would be increased.

4068. But it must always be to the interest of the shipowner to continue to run his ship as long as the premium which he is charged is less than the interest on the capital?—It is purely a matter of calculation.

4069. Interest on the capital, plus the profit that he might gain?—That is so. If a man could make a profit he would never lay up his ship.

4070. Then will you give the Committee your idea as to what standard of values we should take for the payment of the indemnity?—With regard to the method of valuation of ship and cargo for the purpose of indemnity, I think the recompense should be strictly limited to an indemnity for actual loss sustained. Thus: The ship should be taken at her fair sound value at the outset of the adventure, including her provisions and stores, and other disbursements incurred to make the ship fit for the voyage contemplated. Then the cargo should be taken at the prime or invoice cost, together with expenses incidental to shipping it, including advanced freight, if any; and then the freight at the shipowner's risk at the time of the loss, minus the cost of earning it from that time.

4071. As regards the ship, would that involve an agreement as to her value between the Government Department and the shipowner before each undertaking?—No. I do not think there is any difficulty whatever in arriving at the value of a ship.

4072. You would not trouble about the value until after it was lost?—No. I think it would be the greatest mistake possible.

4073. Do you think there would be no difficulty in arriving at a value satisfactory to both parties?—I do not think there would be any difficulty at all in arriving at a fair value. Whether it would be satisfactory to both parties would be another question, but I do not think there would be any difficulty in arriving at a fair value.

4074. How would you propose to fix that value?—You would want a number of experts.

4075. Invited by the Government to act for that purpose?—I think so.

4076. Should their decision be final, in your opinion, or would you give an appeal to the Courts?—I think the decision of whoever was appointed should be absolutely final.

4077. (*Mr. Gladstone.*) With reference to the loss of the American fleet after the Civil War, I think there were contributory causes to that of a special character, were there not. The change from wood to iron, and from sail to steam, had a great effect?—Probably, to a great extent. That was after the date. But at the time of the transference the wooden ships were practically the only thing.

4078. Then I think you say that the capacity of the market for war risks in the event of a serious war is doubtful. Have you had any actual experience yourself?—Yes. During the time of the war between Russia and Japan, for instance, we had a good deal of experience. We were carrying cargoes from different ports to Japan, and immediately a certain sum of risk was put into the market it was more difficult to complete. The market becomes very limited if the risk is at all serious.

4079. But you were able to cover all your risks?—Yes. Some owners paid as high, I think, as 50 guineas. Of course, we got freight proportionate to that.

4080. I gather you do not think the country would suffer severely from any laying up of ships; the cost of laying up would be small, and probably the rise in freights would take them out again?—The cost of laying up a tramp steamer is comparatively small. I do not think it is very great, in comparison, for other ships either. They would simply lay up while they were out of remunerative employment. Of course, the remunerative employment has to cover the cost of insurance.

4081. Do you think that this special law that you suggest, prohibiting the transfer of shipping during the continuance of war, could be made effective?—There is no difficulty.

4082. And do you think it would meet the case?—To my mind, it is vital in any serious war.

4083. (*Chairman.*) I suppose your suggestion for a law of that kind is conditional upon Government being willing to give a guarantee?—Certainly.

Mr. J. P. Maclay. 25 June 1907.

4084. You would not think it fair that Government should place upon a shipowner that disability to sell unless it undertook to guarantee the shipowner's trade?—That is my view, but, at the same time as an individual, I should rather see it for the sake of the nation.

4085. (*Mr. Lindley.*) You laid stress rather upon the fact that you did not consider foreign cargoes should be protected on board British vessels bound from one foreign port to another, but in the words of Scheme A you will notice that the indemnity would be on vessels liable to capture. Foreign cargoes on board British ships bound from one foreign port to another would not be liable to capture?—I take it that anything is liable to capture under the British flag.

4086. The ship itself is liable to capture, but that does not cover the cargo?—If the ship was captured the cargo would go with it.

4087. No; if it were not contraband?—I did not know that aspect of it. I take it from you.

4088. (*Mr. Beauchamp.*) With regard to the market for war insurance, you say that it would be so limited during a state of war that it might not be possible to get everything covered?—Yes. Take the Atlantic trade, for instance. If one or two big ships were lost in the Atlantic, premiums would go to a very high level at once, and the difficulty would be, probably, to get underwriters, when one realises the enormous value of ships and cargoes in these days.

4089. You instanced some difficulty that you yourself as a shipowner had. I did not quite catch what was the voyage?—During the Russo-Japanese war some of our ships were running to Japan, and we had to cover the war risk. During a portion of the period there was a very great amount of war insurance done, and the more that was done the more difficult it became to do. As time went on it became a very trifling premium, but what I mean is that just according to the amount of risk there is to cover, there comes the difficulty of getting proper cover.

4090. Then the insurance market only becomes small when the risk is really serious?—That is so. In a war like the Russo-Japanese war there were a considerable number of British ships captured.

4091. Then you would restrict any form of indemnity to vessels trading between ports in the Empire?—That is my view of it.

4092. The Chairman pointed out that there might be a gap on a round voyage where you would not be covered by the indemnity, and you said that you would be able to fill that up by insurance in the ordinary market?—Yes. The gap would be just as the shipowner made it. The shipowner has the making of the gap. He may either endeavour to secure Empire cargo, and thereby be protected by the Government, or take outside cargo and cover himself.

4093. Then he would have to pay a considerable war premium?—Yes.

4094. And he might not be able to get that out of his freight between those two ports where he was not covered?—Of course, there is no compulsion for him to take it in that case. He would only take it if it paid him.

4095. But it would be cheaper for him to take cargo, would it not, than to go without any cargo at all? I want to make my point clear. He might not be able to get it out of his freight between those two ports, and therefore he would have to make it up on his homeward voyage to this country, in which case the homeward freight to this country would be very heavy and would increase the cost of the articles which he brought in his ship?—My idea is that intermediate cargo would just require to pay its proportion. It would require to pay not only the normal freight, but sufficient also to pay the war premium.

4096. That would depend upon the supply of shipping at the port?—It is a matter of supply and demand.

4097. It might not be possible to do it, in which case the shipowner would have to get it out of his homeward freight?—He has got to make it somehow.

4098. And therefore it would be really cheaper for the country to cover it all the way round?—That is certainly what the shipowner would prefer. As a shipowner, I would prefer that.

4099. It really might be cheaper for the country to do it in that way, to give a continuous cover?—I do not see why the country as a country should cover foreign trade in time of war.

4100. Even then it might be cheaper to the country in the end?—Of course, that is a matter of opinion. What I should like to do would be to make the foreign article pay for itself.

4101. There was one thing you said about the transfer of ships to the American flag. You think that might occur in time of war?—I should think it is extremely probable.

4102. Because America would be very desirous of getting back her shipping?—Yes. I feel it very much. In fact, I know the spirit that exists in many shipping circles in America.

4103. But that could only be done by an Act in Congress?—Or, as I suggest in my précis, by an alteration in their Tariff Navigation Laws.

4104. That would not be very easy in time of war, would it?—I think that could be done very quickly in time of need. I think the American President would not take very long to do it.

4105. But the American Legislature only sits for a very small period of the year. If the war broke out at any time when Congress was not sitting, they would have to call a special session?—If the necessity became claimant, I think the American President might so act.

4106. Might not the belligerent consider a special calling of the Legislature in order to pass a measure of that kind an unfriendly act?—I do not think America or any other country in a similar position would mind that. They are looking after their own trade, and they would simply buy the British ships in the same way that we should from some other nation.

4107. Apart from America, do you think there would be any great transfer of British shipping to other foreign flags?—Everything depends on the Power with which you might happen to be at war.

4108. There are not many other countries, are there, who could buy any very considerable amount of British shipping?—No, there are not very many countries.

4109. America would be the chief one?—America is more in my mind.

4110. (*Sir George Clarke.*) I think you endorse Captain Inglefield's view, that a national guarantee is the cheapest system. Why cheapest, and to whom cheapest?—To the country.

4111. Why to the country?—Because you keep things in a normal condition. I apprehend the true idea in time of war is that our manufactures should not be interfered with, and immediately you have heavy premiums put on to our shipping, freights rise, and our manufacturers are thereby placed at a great disadvantage as against foreign manufacturers. In the same way, freights to this country for food and necessary materials to keep our manufactures going would also greatly rise. The result again would be a great advantage to the foreign manufacturers.

4112. You do not mean cheaper as compared with a scheme of purchased indemnity; that is Scheme B?—I think Scheme A is the true one for the country. I think it would be much cheaper for the country.

4113. But what is the difference?—Because you at once interfere with the normal condition of things when you add to the cost of working the ships, and a shipowner, if you charge war insurance, has simply to get it out of his freight.

4114. The difference is that the Government has got to pay the whole of the indemnity in one case, and in the other case it gets a part of it back from the shipowner. Is it not from the point of view of the country exactly the same?—No, I do not think so. I think Captain Inglefield expresses it properly here. He says: "It is the fairest because it would throw the cost on the taxpayers instead of, as war premiums do, doubly on the working classes by means of increased cost of their food."

4115. But, as far as the country as a whole is concerned, it really comes to the same thing, does it not? It is a difference between classes in the country, but it really comes to the same thing?—I do not think it comes to the same thing; I feel that a tremendous

advantage would be that manufacturers would not have their business upset by war.

4116. When you speak of British ships, do you mean to include Colonial ships too?—I have not considered it. The Colonial tonnage is so trifling.

4117. But would you be inclined to bring them in under the same system?—I should be inclined to bring them in if they would pay a proportion of the cost.

4118. You say that the effect of the indemnity would be to concentrate tonnage in our own trade. Do you mean that it would concentrate commerce in British shipping in time of war?—No, I mean that the British ships would be encouraged to run an Empire trade, because the risks would be covered by the Government.

4119. Do you mean that the proportion of ships engaged in British trade would remain the same?—Would be increased.

4120. (*Chairman.*) By the indemnity being confined to the proportion of British shipping so engaged?—That is what I mean.

4121. (*Sir George Clarke.*) You realise, do you not, that as the neutral carrier would certainly have to insure himself against war risks if he carried a certain kind of article, you are giving a bounty to British shipping during the period of war?—I do not see where the bounty comes in.

4122. The bounty is exactly the amount which the neutral might have to pay in war insurance?—The way my scheme would work out would be this, that the foreigner would pay the indemnity to the British shipowner for the risk he runs in carrying his goods. The foreigner would require to pay the war insurance.

4123. A certain amount of British goods, Empire goods, as you would call them, is carried and would continue to be carried in neutral vessels?—What do you mean by the word "neutral"?

4124. The vessels of the Powers which are not at war?—Yes.

4125. Those vessels under the neutral flag would have to pay a war insurance, especially if they carried food, which an enemy might make contraband. If you get free indemnity for your ships, you have a bounty, as against the foreigner carrying Empire requirements, to the amount of the war insurance that he has to pay. Is that not so?—Of course, the national insurance you might call a bounty. I think I should call it by another name.

4126. But that is the effect?—Neutral shipping has so little influence in this country that I do not think it is worth taking notice of. I do not think anything better could happen to neutral shipping than a war in which the British Government were engaged.

4127. (*Chairman.*) Let me take your own illustration of the Russo-Japanese war. Suppose the Japanese Government had given a free indemnity to Japanese ships, would not you, as a shipowner who had to pay 50 per cent. premium on a certain risk, have been very much at a disadvantage in competition with the Japanese, who would not have paid, though his risk was the same?—Undoubtedly, but I rather took Sir George Clarke to be referring to trade outside of our own country.

4128. No; I think it was exactly that case which Sir George Clarke was trying to put to you, of a man shipping to this country having the choice of a British vessel and a neutral vessel. The war risk in the British vessel might be greater than in the neutral vessel, but that would be covered by a free indemnity, which costs the shipowner nothing, and for which he would make no charge to the shipper. The war risk of the neutral might be less, but that would not be covered by the Government, and he would have to pay something for it, and therefore charge something for it?—I think we should not object to that.

4129. (*Sir George Clarke.*) In an answer to me before, you said that the effect of this free indemnity would be that more British tonnage would be employed. That is, of course, equivalent to saying that there would be a bonus?—It comes, perhaps, something near to that. It is not really a bonus, it is to keep our manufactures on the normal basis.

4130. With regard to the law that you wish to be passed at the outbreak of war to prevent any transference of British vessels, I suppose you do not contemplate that if you got a system of free indemnity the inducements to transfer would be very great?—I do not agree with that at all. It is then I should fear it most. America would at once have to pay much higher freights for its sea-borne trade, and America would take the opportunity, I should think, if it got it, of purchasing tonnage to do its sea-borne trade. I think as much tonnage as the country could utilise would be engaged in Empire trade, and that is what I should say the Government should aim at, so that the normal condition of things should not in time of war be interferred with. That would divert British shipping into the Empire trade which is outside of it now to some extent.

Mr. J. P. Maclay.

25 June 1907

4131. (*Chairman.*) Your idea is that there would be less British shipping available for doing American trade with other countries than Great Britain?—That is so.

4132. And that that would cause America to try to buy British shipping to bring into that other trade?—That is so.

4133. (*Sir George Clarke.*) But why should a ship which has an absolute guarantee under one flag transfer itself to another flag and lose that guarantee?—It would go into a trade in which there would no longer be a war risk.

4134. It depends upon the limitation of your scheme to ships trading between British ports?—That is my position. I advocate Empire trade.

4135. I think you have told us that you doubt the capacity of the open market to carry the war risks?—I do, in the event of a serious war.

4136. And you have said that as a shipowner you would be quite satisfied if there was a sufficiently large number of substantial underwriters?—Personally I would, although I think that the system suggested is the true one for the country.

4137. Therefore you, individually, would be prepared to pay war insurance in the open market if the security was good enough?—I believe I could make more money out of it, as a speculating shipowner.

4138. That being so, one does not quite see why the Government should give a gratuitous guarantee?—I have looked at it entirely from a national point of view. I believe, entirely in the interests of our trade, that the normal condition of things should continue to exist. Immediately the appearance of war showed itself, there would at once be a charge against the British shipowner of the war premium. He has got to get recouped for that, and it is the British manufacturer who has to recoup him, so that the British manufacturer is at once placed at a disadvantage as against the foreign manufacturer.

4139. I suppose it is with regard to Scheme "B" that you suggest this committee of twenty experts, which is to adjust fairly the premiums on the various trade routes, according to the risks. That was your view of the possibilities of Scheme "B," I suppose?—Yes, I say that if the Government adopted this view, that premiums should be put on ships and cargoes, according to the risk.

4140. Would this committee be as careful of the pecuniary interests of the Government as they would be if they had to bear the risks themselves?—I should expect they would be just the same.

4141. Suppose, instead of a committee of experts, you had a fixed scale of insurance premiums for zones of length of voyages, so that you would have a fixed rate for such zones of the world as you travelled over?—That would be quite practicable.

4142. And, that scale having been laid down, ship owners could insure under it with underwriting firms acting as agents for the Government?—Yes.

4143. Would you rather have that, or some such arrangement as that, than nothing, if you cannot get your free or purchased indemnity?—I would very much rather have that.

4144. Your position is that you think the best system for the nation, as a whole, is a gratuitous indemnity?—I am strongly of that opinion.

4145. But if you cannot get that, you think it would be to your advantage to get insurance at some fixed rate from the Government?—I think so.

NINETEENTH DAY.

Tuesday, 2nd July 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Mr. H. LLEWELLYN SMITH, C.B.
Mr. HENRY NEVILLE GLADSTONE.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. FREDERICK HUTH JACKSON.
Mr. ARTHUR LINDLEY.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. RICHARD WALTER JEANS, called and examined.

Mr. R. W. Jeans. 2 July 1907.

Mr. Jeans, in a preliminary memorandum,* had submitted:—

(1) That at the first indication that hostilities were imminent, a banker whose business involved making advances on shipments would insist that the insurance policy attached to the other documents taken as security should cover the risk of capture and seizure.

(2) That although no difficulty has been experienced hitherto in getting cover for war risks, it is possible that after serious disasters it might be difficult to get capture risks covered, even at greatly enhanced premiums.

(3) That a National Guarantee under such circumstances would not only be valuable but essential to the maintenance of our trade and the prevention of transfers. It would also be useful under less serious conditons in restricting the amount of premiums which might otherwise be charged by underwriters to those who preferred not to accept the conditions imposed by the State.

(4) That a separate certificate should be issued for each interest, to accompany the other documents attaching to the relative draft drawn against the shipment, and also in order to facilitate the adjustment of claims, should they arise.

(5) That in order to avoid heavy clerical work it might be preferable for the Government to abstain from direct dealings with the public, and to guarantee the underwriters by indemnifying them for a certain percentage of the loss sustained through capture.

(6) That fraud is not to be feared, since the knowledge that unlimited resources were available to bring culprits to book would act as a deterrent.

(7) That although some scheme of National Insurance in time of war may be desirable, and, if desirable, should be legalised in time of peace, it should be allowed to remain inoperative until it became evident that the time had arrived when the public interest demanded it.

(8) That it is the usual practice of shippers to cover a fair profit on their shipments, in addition to the value of the cargo at port of shipment.

4146. (*Chairman.*) You are manager of the Bank of Australasia, I think?—Yes.

4147. You have seen the reference to this Committee and the draft schemes which we have prepared?—I have.

4148. As regards a good many points on the draft schemes, I think you do not desire to offer any evidence?—I have no knowledge which would enable me to do so.

4149. But as regards the effect they might have, or the absence of them might have, on banks and bankers' business, you are prepared to give us some information?—Yes.

4150. If hostilities become imminent or appear imminent, I suppose the banker at once becomes extra careful about his security?—He becomes anxious about his insurance.

4151. The banker's interest is mainly, I suppose, in the cargo and not in the ship?—Generally, yes.

4152. To a certain extent on shipping?—Of course, bankers make advances on shipping.

4153. On shipping that is afloat?—Certainly.

4154. But they would have far larger sums at risk on the cargoes?—Yes.

4155. If war becomes imminent, would it be correct to say that they would always require a policy of insurance against capture?—Certainly.

4156. Has there been any difficulty in recent years in getting such policies?—No, I think not. It is more a question of rate. The rate sometimes has been somewhat onerous, but not sufficient to prevent free insurance, I think.

4157. Would you be inclined to say that, having regard to the risks that were run, rates were over-extravagant?—Yes, I think so. I think sometimes the risk is more imaginary than real, but it serves the purpose for making an extra charge to cover the insurance.

4158. But suppose you had been looking at it from the point of view of an underwriter and not of a banker, would you have cared to write the risks, do you think, at much lower rates under the circumstances of the moment?—I have no data upon which I could go at all.

4159. You are rather afraid, I gather, that if there were serious captures in the earlier stages of war, or at any stage of the war, it might become impossible to insure at all?—I think it is quite likely.

4160. What then would take place?—I imagine that shipments would be stopped, or that they would be transferred to foreign bottoms.

4161. And in order to prevent that you would be in favour of some form of national guarantee?—Yes. I think that some steps, at all events, should be taken to provide for some protection of that sort.

4162. To your mind the danger of a large diversion of our commerce, or a large interruption of our commerce, is a very real and serious one?—Very serious.

* *Vide* note, p. iii.

4163. You contemplate, I think, that the ordinary channels of insurance should remain open and optional for the insurer?—Certainly.

4164. If he preferred to take an insurance at Lloyd's instead of coming to the Government, you would not prevent his doing it?—Certainly not.

4165. Would you allow him to have the benefit of a Government insurance and a Lloyd's insurance in addition?—That would be a double insurance, would it not?

4166. Yes?—I doubt that. I should think he must elect to insure in either one direction or the other.

4167. Do you contemplate that the Government should charge him a premium?—No, I think not.

4168. You think he should be given a guarantee free?—I think, as it is a national interest, it should be paid for out of national revenue.

4169. Would you as a banker like to see the Government undertaking that business without having made any provision for it in advance?—No, I think an emergency might arise rendering it very difficult to take steps at the moment, and therefore steps should be taken in advance.

4170. I meant something a little different. What I meant was, would you like the Government to undertake such a financial risk without having financially prepared themselves for it beforehand?—I am afraid that is a question that I have hardly considered.

4171. Of course in time of war the needs of the Government must in any case be very large. They would have to come to the market with large loans?—Yes. I dare say it would be more difficult to finance in such times than in ordinary times.

4172. This would be a serious liability for them to undertake if they had no funds on which to draw?—Possibly, yes; but I take it the Government would protect themselves in certain directions by prohibiting sailings on various routes, and even delaying the departure of a vessel, and so on. They would minimise the risks.

4173. Suppose there were such a Government scheme, what is necessary in the shape of a document for the purposes of the banker? Would you dispense with a document altogether?—I think not. The insurance, as a rule, especially on cargoes, is paid for by the consignee—at least, that is my experience in the Australian trade—and he naturally expects, when he gets the other documents, to see that he is properly covered by insurance, and it would be necessary to give him some certificate to that effect.

4174. (*Mr. Huth Jackson.*) And it would be necessary also for the banker?—Yes.

4175. (*Chairman.*) It would not be sufficient for the banker to know that if the vessel complied with certain Admiralty regulations it would automatically come under the terms of a State guarantee?—I think it would be necessary for him to bring evidence of that fact to his customer.

4176. And therefore for each venture, and each interest in the venture, you would require the Government to issue a certificate?—Yes; in the same way that the insurance companies do now, either by policy or by declaration on an open policy.

4177. It would be a very big business to concentrate in the hands of one office, even a Government office, would it not?—Very.

4178. Do you think it would be really practicable?—A very large staff would be necessary to carry it out, and a staff more or less expert, I take it.

4179. It would require a large expert staff, for whom the Government would naturally have no occupation in time of peace?—I imagine that would be the case.

4180. Do you think they could get it together on an emergency, and use it successfully in time of war?—It might be difficult, I think, unless some preparation were made beforehand—some way of providing the possibility of obtaining a qualified staff

4180*. You have suggested in your précis that, in order to avoid this heavy clerical work, it might be possible to avoid dealing directly with the public?—I think it would be much better.

4181. I am not quite certain what your idea is as to how that should be done?—They should guarantee the underwriter on certain conditions.

4182. That they should say to the underwriter, If you charge only such and such a premium, we will guarantee it?—I have not considered the question of dictating the premium, but I should think that the fact that the Government guarantee was behind it would in itself limit the probable amount of extra premium.

4183. I do not quite know why, if the underwriter had a complete Government guarantee, he should charge any premium at all?—There are other risks besides seizure and capture. He charges premiums on the ordinary marine risks.

4184. Yes, but if he had a complete Government guarantee from loss from seizure and capture, there would be no necessity to charge anything for that risk?—There would be no necessity to charge additional premium to cover that risk.

4185. (*Mr. Beauchamp.*) I did not quite catch whether the underwriter was to charge a premium?—Not to cover that special seizure and capture risk.

4186. (*Chairman.*) Would it not be almost necessary to leave some portion of the risk, at any rate, to the underwriter if you employed him as an agent in this way, in order to secure that reasonable care should be exercised?—I think it would be very desirable.

4187. But the main portion would have to remain with the State, if the other objects of your scheme should be attained?—Of course, it would be necessary that there would be a very small proportion. It is to make him careful of the risks.

4188. (*Mr. Huth Jackson.*) Would not the underwriter charge a premium for that portion which he retains?—Yes. It would be very small, I take it, in proportion to the other.

4189. (*Chairman.*) I gather that you are not afraid of the State being the victim of fraud?—I think it is far less likely to be the victim of fraud, for reasons which I venture to state. It is the practice more or less now of insurance companies and underwriters to avoid, if possible, prosecutions, as throwing good money after bad very frequently; but I take it that a Government would not take that view, and a knowledge would exist on the part of the fraudulent person that, at all events, there were ample funds to pursue him.

4190. You think that would be sufficient to deter him?—I think the Government would certainly run no more risk than an ordinary underwriter, and less, probably.

4191. The difficulties of getting evidence might be very great, possibly greater in war and in connection with war risks than in ordinary cases of marine risk?—Possibly, but I think that to a great extent that would be avoided by the fact that the Government would impose certain conditions. I take it that the fraud would take the nature of running purposely into the enemy's hands. That, of course, would be prevented to a very great extent if the Government made conditions as to sailing.

4192. Suppose the cargo owner who wished to get his goods financed by a banker brought to the bank a certificate that he was covered by the Government, but that that certificate showed on the face of it that the shipper and the owner of the ship must abide by such conditions as were from time to time laid down by the Admiralty, would that be good enough for the banker?—It certainly would not be an entirely clean certificate. These conditions, of course, would have to be safeguarded in some way or another.

4193. I imagine that it would be impossible for the Admiralty to lay down regulations at the beginning of a war which would endure for the war. They must be free to change their conditions from week to week, perhaps even from day to day, as the circumstances changed?—To change the contract entered into?

4194. Not to change the contract. The contract would be to abide by the Admiralty conditions, but the Admiralty conditions, for instance, might be that the Mediterranean is unsafe this week, will be safe next week, and might become unsafe again the week after?—I imagine that any risk that had been undertaken under the original orders or instructions of the Admiralty would be carried out, although subsequently certain parts of the route might be closed.

Mr. R. W. Jeans.
2 July 1907.

4195. Suppose a vessel started for the Mediterranean at a time when it appeared reasonably safe for such a venture to be undertaken, but on arrival at Gibraltar the vessel received Admiralty instructions not to proceed; are you prepared for that contingency?—I should imagine that as the Government had accepted a risk in connection with that particular sailing, it would use force to prevent that master from proceeding.

4196. Therefore, the Admiralty instructions for any particular venture in your opinion must be given before the commencement of that venture, and must not be varied during the venture?—I do not think so necessarily. I think they may be varied, provided the new instructions were first conveyed to the master of the ship.

4197. Then take my case of the ship arriving at Gibraltar, bound for the Black Sea, we will say, and finding on getting to Gibraltar that owing to the Mediterranean having become unsafe, the Admiralty instructions now are that such a voyage cannot be prosecuted?—Clearly they would not proceed.

4198. Would you be satisfied that under those circumstances, if they did proceed they should have no claim against the Government?—Then the banker loses his security. I think the Government, having the power to prevent the vessel proceeding—that is, having taken the risk, and having the power, they should exercise it.

4199. You think they should enforce it as against the shipowner in order to protect the cargo owner?—Exactly.

4200. But suppose the cargo owner also wished to take the risk? Suppose he said, "Well, here I am so much out of pocket by having come to Gibraltar with these goods at risk; and I cannot dispose of them elsewhere"?—But he has disposed of his right to dictate in the matter, because he has already hypothecated these goods to the bank, or to some other institution.

4201. If you leave him to the ordinary underwriter, he may take the risk, however bad it be, on payment of a premium which the underwriter thinks proportionate?—Yes.

4202. If he trusts instead to the Government guarantee he may be unable to get any cover for the risk?—I do not think I quite follow.

4203. The Government may refuse to insure the venture at all?—Yes.

4204. Are not there circumstances in which it would be to the interests of all concerned in the ship and cargo that the venture should proceed?—Without the Government guarantee as regards insurance.

4205. Yes?—I can hardly conceive such a condition.

4206. Practically, therefore, in your opinion, such Admiralty regulations as might become necessary would not place any serious difficulty in the way of the working of a Government scheme?—It is entirely dependent on the question as to whether coercion was to be exercised to prevent sailings in contravention of the Admiralty's orders. I think it would be necessary to give to a bona-fide holder of those documents perfect security.

4207. And, therefore, if the Government were not prepared to pay a loss incurred in continuation of the voyage, it would be necessary to prevent the ship sailing for the protection of the holders of those documents?—Yes.

4208. (*Mr. Huth Jackson.*) I take it that you, as a banker, would insist, when negotiating a draft—say, from Australia to Europe—that the cargo was absolutely covered against all risks, including those of war?—Yes.

4209. Suppose that the Admiralty gave a national guarantee without premium and retained the right to control the sailing of the ship, suppose that the ship, for argument's sake, arrived at Aden, and the Admiralty instructed the captain that it was unsafe to go through the Mediterranean, and the captain disobeyed those orders—in that case the owner of the ship would not be indemnified for any loss that might occur if the captain disobeyed the Admiralty orders?—The owner would not certainly, if he acquiesces in ignoring the Admiralty orders, but somebody else may really have a lien over the ship, and the insurer may not really be the directly interested party.

4210. But you are only interested in the cargo, I take it, in these particular instances?—Yes.

4211. You would still contemplate, I presume, that the owner of the cargo should be indemnified?—Certainly.

4212. Or should he suffer for it?—No, he should be indemnified.

4213. You say that a separate certificate of insurance should be given in each case?—Yes.

4214. What is the present practice in Australia?—Either a separate policy is issued with each shipment, or, in the case of an open policy, the insurance company issue a certificate that the risk has been declared upon the policy.

4215. When a shipper in Australia comes to your bank and offers a documentary bill for negotiation, he attaches the bills of lading; what evidence would you require, then, with regard to the insurance?—Either the policy, or a certificate of the underwriter's that the risk had been declared on an open policy to him, the proportion declared being held in turn by him to the bank.

4216. The certificate of a London underwriter?—Yes, generally London.

4217. (*Mr. Gladstone.*) In the case of goods, do you merely take the statement of the shipper?—No; we always get the insurance cover in the Australian trade. We always have the complete shipping documents, including the policy of insurance, or a declaration, as I say.

4218. (*Mr. Huth Jackson.*) Would there not be some difficulty in arranging for a complete separate certificate from Australia?—I have never experienced it.

4219. I mean in the special circumstances contemplated?—There would be the difficulty we spoke of just now—that is, the enormous amount of clerical labour entailed.

4220. You mentioned that you contemplated, in the absence of any national guarantee, a considerable diversion of vessels to other flags?—I should imagine so, but I am not an expert in that.

4221. Have you any knowledge of the difficulties there are with regard to the transfer of shipping?—Not at present.

4222. That would naturally be controlled by the difficulties there may be with regard to the transfer of ships?—Yes.

4223. (*Mr. Lindley.*) In answer to the Chairman, you used the words "double insurance," in the event of an insurance being effected with the ordinary underwriters as well as the guarantee from the Government?—Yes.

4224. I do not quite know what was in the Chairman's mind when he asked the question, but I think he meant an excess insurance over the value of the guarantee. If that was the case, do you see any objection to that?—Then the ordinary insurance would be effected with the underwriter, and the seizure and capture risks would be underwritten by the Government.

4225. Yes, to the limited value mentioned in the scheme that has been put before you. You see in your answer to No. 8 you refer to the practice of the shippers to cover a fair profit on their shipments?—Yes; that is so.

4226. That is not contemplated by either of the two schemes put before you, is it?—No.

4227. That is, I think, what the Chairman was referring to in his question; that is to say, if the Government only guaranteed the actual value, including the charges incurred in getting the goods to this country, that would still leave the shipper uncovered for his profit?—Yes.

4228. Do you see any objection to his being allowed to effect an insurance with underwriters for that?—Certainly not.

4229. That would not be a double insurance?—No.

4230. Would it not be sufficiently satisfactory to the bank if in an Act of Parliament it was clearly stated what the Government were prepared to cover in all cases?—It would be satisfactory to the bank, but the bank has to satisfy its customer.

4231. Is not the customer to a certain extent dependent upon the bank, and does he not have to take what he gets?—No, I think not. He would want some evidence that the insurance had been effected.

4232. He has got the Act of Parliament?—Yes, he has got the Act of Parliament, but he has not any proof that that particular shipment has been declared.

4233. Would it be sufficient, for instance, supposing the notification of the shipment were given to a special Government Department and reply from that Department just acknowledging the notice were issued?—That would be equivalent, I take it, to a certificate.

4234. Yes, but it might save a lot of time and trouble if it were dealt with in that way?—Possibly. You see it would be necessary to give particulars of the shipment, I take it, and I do not think there would be any less labour entailed in giving that than in giving an ordinary certificate.

4235. Only that the one would merely be a question of registration, and the other you might probably have to put expert clerks to deal with?—Marks and numbers and so on, I take it, would have to be given.

4236. I see your point. Anyway, you think as a banker you must have a document?—If the Government is to deal directly with the insurer, yes.

4237. (*Mr. Beauchamp.*) You think that some such scheme as this is necessary, because of the fear of the insurance market not being large enough to cover the various shipments. Is that because you think that the underwriters would not take the risk, or is it that you think that if there were many losses the bankers might not be satisfied with the policy?—I think there is a little to be said on both those points. I think the underwriters would probably hesitate very much, and I think also the bankers would begin to think that the underwriters were taking very large risks, and it was necessary to exercise caution.

4238. With regard to the document being necessary, of course that difficulty would be got over if the underwriter issued the ordinary policy and the State guaranteed the underwriter and not the shipper?—I think that would do.

4239. Because otherwise there would be an enormous difficulty in providing a Department after the outbreak of war?—There would be an enormous amount of labour.

4240. And the difficulty might be to find anybody at that time really to give his services to conduct a thing for what must be a temporary service?—Quite possibly.

4241. (*Sir George Clarke.*) Do you propose to allow the underwriter to fix the premiums for the risks which the Government has to guarantee?—No, I take it no premium could be charged by the underwriter for a risk undertaken by the Government.

4242. I am not quite clear whether the Government fixes the rate in that case, or whether the underwriter does?—The underwriter would necessarily charge for the proportion of the risk that he accepted himself.

4243. Otherwise I do not know exactly what he does; he gives a document, that is all?—Yes, he gives a policy covering all other risks, and 10 per cent., say, or a fixed percentage of the capture and seizure risk.

Mr. R. W. Jeans

2 July 1907.

4244. He gives a policy for which he charges nothing, and he puts on a little premium to cover himself for the ordinary risk he has to cover?—No, I take it he charges an ordinary premium for the ordinary risk.

4245. He takes the ordinary marine risk?—Yes.

4246. But, I suppose, he has got to cover himself for the 10 per cent. of the loss?—Yes.

4247. He puts on a little for that?—Yes.

4248. So that it comes to this, that the ship is covered at the ordinary marine risk, plus a small percentage?—That is what I contemplated.

4249. (*Sir George Murray.*) Supposing heavy losses were incurred by capture in war time, would it make much difference to the money market whether they were liquidated in the ordinary way, that is, if they fell upon the underwriters, or whether they fell upon the Government?—I do not quite follow.

4250. Would it make much difference to the money market whether the Government came into it as a large borrower to cover these losses, or whether they fell upon the underwriters and were liquidated in the ordinary way?—I should almost think that the effect would be less in the Government case than if the underwriters and others were called upon suddenly to realise their securities.

4251. You think it would be less than if it fell upon the Government?—I think so.

4252. (*Chairman.*) How do you imagine the Government would obtain the funds to liquidate its losses?—In the ordinary way, by the issue of Consols, or by the issue of Treasury Bills or Exchequer Bills.

4253. And you think that the issuing of new Consols by Government would have a less disturbing effect upon the market than the sale possibly of some old Consols by private individuals?—I think so. Of course, it is a matter of degree. If the losses became very heavy, necessarily the realisations would have to be very heavy, in which case I think it would cause a steadily depreciating market to a much greater extent than if an issue was made by the Government.

4254. (*Mr. Huth Jackson.*) With regard to what Sir George Clarke was asking you as to the charging of a premium by the underwriter for his proportion of the war risk, might I put a concrete instance to you? Supposing that a shipper went to the underwriter and took out an ordinary marine insurance policy, and then applied for a war policy, I suppose the underwriter would charge, say, at the rate of 30 guineas per cent. for the 10 per cent. of his risk?—The proportion, yes.

4255. That would really mean only 3 per cent. on the whole risk?—Yes.

4256. That is the way in which you meant it should work?—Yes.

TWENTIETH DAY.

Tuesday, 9th July 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*)

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. FREDERICK HUTH JACKSON.
Mr. ARTHUR LINDLEY.

Mr. GEORGE H. DUCKWORTH (*Secretary*).

Sir THOMAS SUTHERLAND, G.C.M.G., called and examined.

Sir T. Sutherland, G.C.M.G.
9 July 1907.

Sir Thomas Sutherland, in a preliminary memorandum,* had submitted:—

(1) That the ideas underlying a project of National Guarantee are:—

(*a*) The sufficiency of a less powerful Navy if, under a guarantee, the mercantile marine can be kept at sea in war time.

(*b*) The dread of the transference of a great proportion of our tonnage to a neutral flag in time of war.

(*c*) The danger of the loss of our sea-borne commerce, and the risk attending our food supply.

(2) That nevertheless a very strong Navy would, in any case, be essential, for without it the risks to shipping would be so great as to reduce any scheme of National Guarantee to a dead letter.

(3) That if the Navy were strong a scheme of indemnity would be unnecessary since with a reasonable chance of safety and the prospect of large gains, there would be plenty of enterprise amongst shipowners without the intervention of Government.

(4) That there is little ground for apprehension that transfers to a neutral flag would be effected in time of war since the necessary purchase money would not be forthcoming. That the number of transfers that might take place in anticipation of war would not be so great as to affect the ultimate status of our shipping industry. And that transfers after a declaration of war would be invalid.

(5) That any scheme having for its object the keeping of our sea-borne commerce alive and ensuring the continuance of our food supply in time of war, even though its efficacy was doubtful, is to be welcomed by shipowners; though it is not to be expected that the Legislature could admit a broad and generous acceptance of all maritime risks in time of war, including life risk and indemnity in the event of wounds and imprisonment, since this would be to throw all the losses on the taxpayer, while the profit would belong to one favoured class of the community.

(6) That if the indemnity were to be hemmed in by narrow restrictions it is unlikely that shipowners or merchants would be better off under a National Guarantee than under present conditions.

(7) That it would be open to the State, in the absence of an indemnity, to charter ships to carry provisions in the same way as vessels are now chartered to carry troops and warlike stores if the condition of affairs was desperate and insurance unobtainable.

(8) That naval wars are not likely to be of long duration, and that it is probably sounder policy to increase the strength of the Navy than to support theories of State insurance which appear to be academic rather than practical.

4257. (*Chairman.*) Sir Thomas, you know the terms of the reference to this Committee?—Yes, I know them generally.

4258. I think the most convenient way would be that you should make a statement of your general views to the Committee?—I see your Secretary has been kind enough to embody a short statement which I made in the form of certain propositions or views, and I do not know that I can add very much to it.

4259. Would you give us your views as put in your paper?—I will. I preface it by saying that this idea of insuring our commerce in war time, so as to keep our ships at sea, is one which was very much ventilated in 1885, at the time of the Russian scare about the Penjdeh affair, which, of course, most of us remember, and which I recollect very distinctly. Nobody could ever discover any means by which the idea could be practically applied, and as soon as the danger was over the idea evaporated, until, as far as I know, the Royal Commission on the subject of our food supply. Then, of course, it revived again. With regard to that idea, there is no doubt that one of the underlying features in the minds of, I will not say a great many people, but, at all events, certain people who talked about this subject in 1885, was, that if we could insure our merchant navy so as to keep our ships at sea in war time it would hardly be necessary to have quite such a strong Navy as otherwise. You will remember that in 1884 and 1885 there was a great uproar about the weakness of our Navy, and it was remedied to a certain extent, although not fully until some years afterwards, when the Government of the day obtained a very large grant of 20 millions of money right off in order to try to set things straight. Upon that point I hold that it is absolutely necessary, if you are going to have any insurance system that will be operative, that we shall have a very strong Navy, because otherwise any scheme of indemnity with regard to shipping in war time would, in my opinion, become a dead letter. Apart from that underlying idea, there is another feeling, and that is the dread of our pre-eminence as shipowners being lost through a great proportion of our tonnage being transferred to other flags. Upon that point I must say that, seeing the extent of our tonnage, the extent of our shipowning power, and our resources to construct new vessels, which are superior to almost all the rest of the world combined, I should not myself be apprehensive of any great change in our position in that respect. I have no doubt that if it were possible at the outbreak of a war to transfer ships to a neutral flag, by being well paid for doing it, a certain number of vessels would certainly be transferred. But I do not think it is probable myself that any neutral Power, or any body of neutrals, would be likely to come forward to buy anything approaching to the 16 million tons of net registered tonnage which we

* *Vide* note, p. iii.

Sir T. Sutherland, G.C.M.G.

9 July 1907.

have now under our flag. That 16 millions represents a gross tonnage of, we will say, 24 millions probably. I do not know what the value would be, but I should think that on the Register basis of shipping it would be well on to £250,000,000 or £300,000,000. Ventures in shipping do not run to large figures of that kind, or anything approaching it, and shipowners are very much accustomed to lay up their ships if they cannot employ them or sell to advantage. No doubt the first effect of a war would be largely to lay up ships; there is no question whatever about that. But the prospect of a heavy purchase of tonnage is, I think, more or less chimerical, especially as (although this is a question for a lawyer, which I will not profess to be at all an authority about) I imagine that there will be almost an insuperable difficulty in the way of getting effective transfers of ships to neutrals after war had been actually declared. It might depend very much upon the relative strengths of the Powers at war and the neutrals. Probably a very big neutral would have a very much better chance of holding its own in a transaction of that kind than a weaker neutral. What I mean to say is this, that supposing we were at war with a European Power, and America stepped in to purchase our ships, probably the European Power would not be so ready to fix a quarrel upon America as it would be to quarrel with Norway or Sweden or any of those smaller Powers that are now in the habit of buying our ships, as things are at present.

4260. And America would be the Power that would be best equipped financially for carrying through such a transaction on a large scale, would it not?—I do not think myself that America would pay a very large amount of money for any large purchase of our shipping. America has not got the appliances for continuing the construction of ships. What many people no doubt are thinking of is the possibility of a revolution in shipowning such as occurred after the American war. But that was an era of wooden ships; we are now in an era of iron ships. The circumstances are totally different; the conditions are in no sense the same at all. Give America time, and no doubt she could do a very great deal; but after all I take it we should most of us agree that naval wars nowadays are rather short, and there would be no time for America to create great engineering and shipbuilding establishments in iron and steel such as we have in this country. That is an absolute necessity for any Power that is to become a large shipowning Power, I think. Then there is the other idea underlying this enquiry, and that is the danger of the loss of our seaborne commerce and the risk attending our food supply. That is, I suppose, the *raison d'être* of this Committee. If the dangers of capture, imprisonment, and loss of life were very serious, which would be the case in the absence of a strong naval force, neither shipowners nor seamen would be likely to tempt their fate on the mere chance of recovering insurance. The converse proposition naturally at once arises—namely, Why, if our Navy is a strong one, should the country speculate in war risks? If there is a reasonable chance of safety and large gains, if the venture in sending ships to sea is successful, there will be plenty of enterprise forthcoming without the intervention of the Government. That brings one naturally to the third point of enquiry—namely, the danger of the loss of our seaborne commerce and the risk attending our food supply. This remains, then, the object of keeping our seaborne commerce alive, and especially to ensure the continuance of our food supply. As a shipowner, I am quite willing to welcome any indemnity project in this direction, though I may greatly doubt its efficacy. A policy of this kind can only be in the nature of an experiment. If it were to cover a broad and generous acceptance of all maritime risks in time of war, including life risk and indemnity in the event of wounds and imprisonment, such a policy would hardly, I fear, be accepted by the Legislature, as it would throw all losses on the taxpayer, while the profit would belong to one favoured class of the community. If, on the other hand, the indemnity were to be hemmed in by restrictions, such as I see are suggested in your reference, it seems unlikely that shipowners or merchants would be better off under any Government scheme than by taking their war risks into the open market. Should the circumstances of the country be so desperate that underwriters would not insure at any price, the Government might step in and charter ships to carry provisions, as they do now to carry troops and warlike stores. Such a state of affairs would imply that our Navy was not powerful enough to defeat the enemy's fleet in the open or to shut up their ships in its fortresses. I was thinking at that moment about Lord Nelson chasing the enemy's fleet, and I say that we should not have to chase the enemy's ships about for a year to know where they were located.

4261. You think it less possible for them to escape notice than in the old days?—It is a question of naval strategy. What one would have to fear most would be the escape of a cruiser, say, from blockade. I suppose that could not be kept dark very long, and a cruiser would have to be followed, I should assume, by two cruisers more powerful if possible, if we have an adequate Navy. Then, again, why I think insurance in such a case would be of slight practical value, is that if a cruiser is let loose in that way on the broad ocean she could not easily capture commercial ships; she could only sink and destroy them. Who is going to run the risk of sending ships to sea under those conditions? How could you get men to go? The enemy could not carry her capture to another port, and therefore I fear myself that the insurance idea would not be effective in a case of that kind, supposing it were to arise. With regard to the question of food supply and general insurance, there is no doubt to my mind that the first effect of a war with a European Power would be very serious indeed. For instance, supposing it to be a Power in the Mediterranean, which most likely it would be, the Mediterranean for the time being would be shut up, and the next point would be whether we should be strong enough to keep the Atlantic open. If we were strong enough to keep the Atlantic open, then, as far as our food supply was concerned, I take it we should have no overwhelming anxiety, because we should not only have North and South America, but we should have Australia, and Australia is capable of producing food enough, if the price proves remunerative, to add very largely indeed to our supplies. Of course, that state of affairs would be disastrous in the meantime to such companies as the P. and O. Company, unless they were able to take the Cape route. But no insurance would ever be adequate to encourage shipping, in my opinion, to pursue their voyages through a sphere or an area where warlike operations were likely to be in existence, and where the danger of capture would be imminent. Look how the other day these commercial cruisers of Russia frightened us out of our wits, although they were acting illegally. The "St. Petersburg" and another vessel dodged about in the Red Sea, and nearly stopped British trade. They did not stop ships from sailing, but they actually affected so strongly the shipments to China, the Straits, and to Japan, that for a few weeks, until it was found that the capture was absolutely illegal, our commerce suffered tremendously. I cannot believe, therefore, that where there is a risk of life and imminent danger of capture your insurance would be effective. Where, on the other hand, there is a fair chance of one shipowner making a large profit, and an underwriter making a large profit, there will be, as I say, plenty of enterprise forthcoming. I need hardly add, however, that if you can formulate any scheme which you think would come into operation in case of war, I have no objection to the experiment.

4262. I gather that, speaking as a shipowner, you would not be in favour of a scheme which involved a contribution from the shipowners?—Speaking as a shipowner, I do not think so. It would mean, I suppose, imposing a heavy burden upon the shipowning community, and I do not think such a scheme would ever have a chance of going through Parliament.

4263. It has been suggested to us by some witnesses to make it compulsory on the shipowner to pay a small sum annually, say, an eighth per cent., in return for which he would be guaranteed against war risks, this eighth per cent. which he paid in time of peace accumulating to make a fund out of which to return him his war losses. What is your view upon that?—Is it suggested that the shipowner should pay in the meantime?

4264. Yes?—I do not agree with the man who suggested that idea. The *raison d'être* of your enquiry is not taxation of shipping, but food supply.

4265. (*Sir George Murray.*) And the supply of raw material generally?—Raw material also. It would be very hard, it appears to me, upon the merchant who had sent in his ship what was not considered raw material if he had to pay for a man who was the consignee or the shipper of raw material or food. For instance, take

Sir T. Sutherland, G.C.M.G.

9 July 1907.

trade with India or China, or any of those countries where a large miscellaneous trade is carried on. Would tea be a raw material? I do not know whether it would or not.

4266. (*Chairman.*) Food?—But take the case of raw silk. Raw silk is raw material largely carried in British ships. It is raw material for France, however, rather than for Great Britain at the present time. But silk goods, which are shipped in the same vessel as raw silk, for instance, would be raw material in a certain sense largely for Great Britain, because it is used for manufacturing purposes here. But it is not raw material in what you may call the concrete sense.

4267. I think you may take it that those who have advocated such a scheme are of opinion that you cannot distinguish between different forms of cargo; that the theory, perhaps, would justify the distinction, but in practice it would be impossible?—That is quite right. Then the *raison d'être* as affecting food does not stand by itself, and you cannot, as it were, make a recommendation on that point alone. Now upon that basis your recommendation if you make one in favour of an insurance scheme, would be in favour of protecting merchant shipping in all ways. If you can draw up such a scheme I shall be very glad. I hope I shall not see it at work, because I hope there will not be a war; but I shall be very curious to see the scheme.

4268. And, provided you get it for nothing, you would not object to it?—It is no use suggesting I am going to be taxed in advance.

4269. You would not like to pay anything for it?—Not by anticipation.

4270. Supposing there is no scheme, and you are left to the ordinary operations of the market, could you insure your shipping if a great war broke out?—It would all depend upon the circumstances for the time being. I believe you can insure anything if you have a fair chance. If the chance is hopeless and you cannot insure, and there is a question of getting food, I should think the best thing Government could possibly do would be to charter vessels and to convoy them if it were reduced to such a dire state of things as that; but in ordinary circumstances I should say you will find people quite willing to insure.

4271. And solid people who could pay their losses if they lost?—I should think so, but until we have the conditions before us who can say? The first result of a war would undoubtedly be panic all round and high prices. Then we should see very soon what was going to happen. If we had a chance of doing business there is no doubt business would be done.

4272. You said just now that no doubt the first result of a serious war would be that many ships would be laid up?—Probably.

4273. I suppose your view is that if the Navy was in a position to do its duty, that state of things would cease very rapidly?—Probably.

4274. It would only last a week or two?—I think that if our Navy was strong enough to give an effective patrol on seas where the enemy, properly speaking, had no business to be, for instance on the Atlantic, you would find ships running very soon, especially fast ships. The slower ships no doubt would be laid up to a very much larger extent.

4275. I suppose, to a great extent, it is the slower ships that are most important from the point of view of our food and commerce?—I suppose it would be a question of convoy in that case. Of course, the slower ships are the larger carriers. But then prices would be so high that, although we could not possibly carry on our present work without these large carriers, still we could carry on a diminished amount of work by fast ships which would give a better chance of safety. But even fast ships would not risk going to sea unless there was a fair chance of safety.

4276. Your conclusion on the whole is that whatever money we have to spend had better be spent on keeping the Navy strong than on paying for losses which might occur through a weak Navy?—Absolutely.

4277. (*Sir George Clarke.*) No one has suggested to us that any form of national guarantee would enable us to reduce our expenditure on the Navy. Do you think it would have that tendency?—No guarantee would be operative unless you have fair security at sea.

4278. But you do not think if we had some form of guarantee it would produce a tendency in the country to reduce its naval expenditure?—No, I do not think it should.

4279. As you know, hitherto we have proportioned the strength of our Navy to the strength of other navies, so that nothing that we did in the form of a scheme for national guarantee in time of war would cause any expenditure in time of peace, and therefore the Navy Estimates would not be affected in time of peace?—That is so probably.

4280. I think you feel that whatever strength the Navy has, we must expect losses of some sort?—I dare say. You can hardly make omelettes without breaking eggs. I suppose we must have losses.

4281. And you think, also, that the losses, as we have been told by other witnesses, will be most heavy in the first few weeks of war?—Yes, I think so.

4282. Then would not that be the period in which there would be likely to be a great rise in insurance rates?—Yes. Things march very rapidly nowadays, but I should think it would probably be a month, at all events, before people began to see things clearly.

4283. Then you think not only the rise of rates but the general fear of capture would cause a large number of ships to be laid up at the outset of war?—Yes.

4284. Have you formed any idea of what insurance rates would be likely to run to in the event of a war with a great Power?—Not the faintest. It is impossible for me to form an idea.

4285. I think you have told us that the fast steamers would be the most likely to show enterprise?—At first.

4286. And that the fast steamers would be the most easily insured?—Yes.

4287. So that it is the bulk of the slow steamers which carry our food which would be most likely to be laid up in war until the seas appeared to be clear?—The fast steamers are, of course, not very large carriers; you may take that as an axiom; but they could carry to a certain extent—I do not say to the necessary extent. We could not have our present food supply, at all events, without having a very large proportion of our slow tonnage at work; that is quite certain. But the steamers that would first take the route, as it were, would be likely to be fast steamers, to whatever extent they might be available. We could not have our present food supply without a large employment of what are called cargo steamers, which have a speed of 9 knots, 10 knots, and so on.

4288. And the owners of those slow steamers would be the owners least likely to show enterprise or to risk much?—I think everybody would show enterprise if they saw a fair chance of profit. I do not think it would be confined to any particular category.

4289. You have told us that you would welcome any scheme which would have for its object the keeping of the British trade running in war. Would you like a system of insurance at fixed rates laid down in peace beforehand, so that you would know your maximum charge for insurance?—I should say it is absolutely impossible, but that is a matter of opinion, of course.

4290. Why impossible?—You mean to define the rate of premium before war?

4291. Yes?—In my opinion it would be quite impossible.

4292. Why?—Because you cannot measure the risk until you know what it is.

4293. You cannot measure the risk, but you would have to assume a certain proportion of loss on a year of war, say, and you might presumably base that upon our experience in the last great war. That would give you a fixed rate; it might not be right, but it would steady the insurance market, and it would tell all shipowners exactly what their maximum charges would be. The State might lose or the State might gain, but if it had the effect of enabling ships to go to sea, would not that help the movement of British trade?—Do I understand you to mean what the Chairman referred to, an anticipatory rate?

4294. No, an actual rate which only came into force when you asked for it?—What is the use of defining an actual rate, perhaps years before the war breaks out? If you can get Parliament to pass an Act by which Government is going to take broadly all the risks of underwriting on its shoulders in the event of war, then it must be left to the Executive to fix the rate if you mean that the shipowner is to pay the rate.

4295. Yes, the shipowner and cargo owner to pay the rate?—Then the Executive will have to make a bargain with the shipowner. You cannot anticipate the rate. The Government officials, say, the Treasury or the Post Office, will then have to become underwriters, and say that for a voyage to the United States the rate will be, say, 5 or 6 per cent. If the shipowner accepts that, well and good. If the shipowner does not accept it and ships are required for the work, then the Treasury or the Post Office must alter the rate. How can you tell beforehand?

4296. You cannot tell, in the sense of being sure, that the rates fixed in advance would cover the losses. Probably they would not; but if the State agreed to cover the losses, do you not think that the steadying effect of the fixed rates would be a benefit to the shipowner?—I hold it is absolutely impossible to define the rate. The rate must wait upon the circumstances; you cannot settle upon it.

4297. But is it not just the rapid fluctuations of the rates which would be a trouble to you in war?—That would be a matter of experience. You cannot settle it beforehand, I am perfectly sure.

4298. But you would expect very violent jumps, would you not?—One morning the rate might be 5 per cent., and the next morning it might be up to 20?—You cannot prevent violent jumps.

4299. I suppose you really do not think it is worth while for the State to take any steps to mitigate the burden of war insurance?—I am not at all advocating that a view which happens to be my own should be followed; far from it. I am only saying that from my point of view it would be a most difficult thing to devise a scheme based upon the reference to this Committee. But if the Committee is able to devise a scheme I shall look upon it with the greatest possible interest.

4300. If any scheme were to be proposed, I gather you do not think it should be a free indemnity, the State giving it for nothing, but an indemnity for which the shipowner and cargo owner contribute something in time of war only. Do you prefer that?—Yes. I have never known the State to do anything for nothing.

Sir T. Sutherland, G.C.M.G.
9 July 1907.

4301. And if the conditions of such an indemnity involved restrictions on the movement of trade, as ordained by the Admiralty, I rather gather you think that would annul its value?—I can hardly tell until I see it.

4302. Of course, you cannot lay it down beforehand, but do you think any restrictions on movements, in order to follow Admiralty instructions, would destroy the value of the system to the shipowner?—I do not see how I can express an opinion upon that point until I see the scheme.

4303. Whatever the scheme were, whether it were a good or a bad scheme, supposing it involved as one of its conditions that ships had to follow instructions given to them at various parts of the world by the Admiralty or its representatives, do you think those restrictions would spoil the effect of the scheme from the point of view of the shipowner?—Of course, if the conditions of the policy required the shipowner to follow certain routes, the policy would be vitiated if he did not follow them. That seems perfectly clear. But whether it would be wise to make that part of the scheme of indemnity is quite another question. I should doubt it myself, because, while the Admiralty would be very likely to be the most competent authority to give advice to shipowners as to the way in which they should navigate in time of war, and advice which shipowners would be only too glad to follow, circumstances might arise when even information outside the Admiralty came, which would guide a clever shipmaster in following, perhaps, some other line, and getting outside the line that might be laid down.

TWENTY-FIRST DAY.

Tuesday, 16th July, 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir THOMAS GLEN-COATS, Bart., M.P.
Sir JAMES L. MACKAY, G.C.M.G., K.C.I.E.
Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Mr. H. LLEWELLYN SMITH, C.B.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. FREDERICK HUTH JACKSON.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. JOHN STANLEY MITCALFE, called and examined.

Mr. Mitcalfe, in a preliminary memorandum,* had submitted:—

(1) That the war risk class of the North of England Protecting and Indemnity Association provides for the protection of British shipowners against risks excluded from an ordinary Lloyd's policy by the "Free from capture and seizure" clause, but does not cover vessels carrying contraband of war. The values entered in this class amounting to upwards of £21,000,000.

(2) That the State should undertake to make good to shipowners and traders losses incurred through capture of shipping by the enemy in time of war, if a workable scheme can be devised; but that the practicability of any such Indemnity has been made doubtful by the experience gained during the Russo-Japanese war.

(3) That this indemnity should be gratuitous, or for only a small percentage of the estimated cost of covering each loss, in order to put British shipowners on an equal footing with neutrals.

(4) That the protection given by Government should not be granted without most careful consideration.

(5) That each case, or at least each trade, should be dealt with on its merits by a committee of experts, with power to decide as to the premium, if any, to be charged, and the amount of indemnity to be paid in case of capture or detention.

Mr. J. S. Mitcalfe.
16 July 1907.

(6) That the Admiralty, in conjunction with the expert committee, should decide the course to be taken so far as each vessel or voyage was concerned; and that the conditions of Clause 3 of Scheme A would have to be complied with in order to secure the indemnity.

(7) With regard to various suggestions brought before the Royal Commission on Food Supplies, Mr. Mitcalfe submitted:—

(2) That a fixed charge of 2 per cent. for a Government indemnity would only be effective if rates went above this amount, and only then if sufficient freight could be obtained to cover this premium.

(b) That an indemnity given to owners of cargo only would not put British shipowners on an equality with neutrals.

* *Vide* note, p. iii.

Mr. J. S. Mitcalfe.

16 July 1907.

(c) That the Government might give a guarantee for special trades, each voyage or trade being dealt with on its merits, but that in time of war neutral ships would probably be preferred to British, even though the rates of freight were the same.

(8) That the settlement of the amount of indemnity for a total loss of ship or cargo on the lines suggested in Scheme A would be comparatively easy, but that serious difficulties would arise in connection with the detention and deterioration of cargoes owing to compliance with Admiralty orders.

(9) That sufficient consideration has not been given to the unwillingness of seamen to sail in belligerent ships owing to their personal risk from mines, and the uncertainty in connection with the carriage of cargoes which might be treated as contraband.

(10) That in order to minimise this difficulty a list of contraband goods should be formulated, and that the Government should undertake to recover, or pay, any loss sustained by British shipowners in consequence of the improper destruction of their property.

(11) That owing to injurious restrictions on the part of Government, ships are now transferred to foreign countries, and that in case of war it is probable that a much larger number would be so transferred.

(12) That owing to the losses during the Japanese war the extent of the insurance market for war risks has been greatly restricted.

(13) That a committee of experts would be able to reduce the danger of fraud to a minimum, but that the insured values of ship and cargo, as suggested in Schemes A and B, would have to be investigated before acceptance.

(14) That the liability of war risk policies to a full marine stamp duty has greatly hindered the development of protecting and indemnity associations in this direction and should be removed.

(15) Finally, that a Government indemnity or insurance guarantee, although desirable, is hardly practicable, and that a strong navy is the best guarantee for the continuity of maritime transport trade under the British flag.

(16) That, in default of a scheme of guarantee, every assistance in the direction of self-help should be afforded to British shipowners, and that "contraband" should be defined officially.

4304. (*Chairman.*) You come here to-day, I think, representing the Chamber of Shipping of the United Kingdom?—That is so, but it must not be taken that I bind them to my views. They have not yet discussed this subject, and therefore, although I was nominated as an expert in such matters, it does not necessarily follow that I may give expression to their views.

4305. You have had considerable experience as an underwriter, I think?—Yes, for the last 30 or 40 years.

4306. You were underwriter of the Northern Maritime Insurance Company from 1865 to 1891?—I was, and I have since been chairman of that company.

4307. And you have been connected with the North of England Protecting and Indemnity Association since its formation?—Yes.

4308. And you were chairman of that association last year?—Yes.

4309. Would you tell us what the war risk class of your association is?—To put it as shortly as I can, the war risk class provides protection for shipowners against the risks excluded from the ordinary Lloyd's policy by the free from capture and seizure clause, but it does not cover vessels carrying contraband of war. Of course, I can go into detail as to that if you wish.

4310. Perhaps you could tell us briefly what was your reason for excluding ships carrying contraband of war?—We saw at a very early stage that large freights would be paid for carrying contraband, and therefore it was supposed that such shipowners as went in for that could well afford to pay the war premiums. Manifestly you could not run an association on a mutual basis and allow some to take very great risks while others did not.

4311. Your association covers the risks to its owners' ships in cases where we are not a belligerent?—Yes. And even where we are belligerents, but we have not had such experience yet. I might point out that we completely cover ships that have entered into contracts before the declaration of war. Where goods have proved to be contraband during the voyage we take that up, and we protect against any sudden emergency.

4312. Will you state briefly your general views on the subject of the reference to our Committee—namely, as to the desirability of the State undertaking any liability?—I think it would be very desirable if we could enable our ships to keep the sea during a time when Great Britain was a belligerent. But the more experience I have the more difficult it becomes, and were it not that it is impossible to say nowadays what is impracticable, I would certainly describe any such scheme as impracticable.

4313. You say that the more experience you have the more difficult it becomes?—Yes.

4314. In what way?—Because of the very difficult questions that we have had to deal with during this Russian War. Each shipowner was extremely anxious to get big freights and to be covered by someone else, and the same thing would apply were you to give a national guarantee, or indemnity, or whatever it may be.

4315. Do you think, speaking generally, that the effect of your mutual indemnity was to keep freights down at all?—Not freights. We do not interfere with freights at all. I think that the effect was in many respect to keep war-risk premiums down. I cannot see how it would apply to the freights.

4316. Only indirectly in that way, that if the war-risks premium is kept down one cause for the freight rising has gone?—That may be, but we have a considerable foreign competition, too. That is an element, doubtless, but so far as vessels that were not carrying contraband were concerned, the premium was light during the past war. It would be very different if England was a belligerent.

4317. In those cases where the premium was light there was still, I gather, a considerable rise in freights as compared with peace time?—That depends where it was to. To Vladivostock, to the Russian ports, or to the Japanese ports, doubtless that would be so, but I am not aware that it had any effect on other ports beyond the scope of the danger zone.

4318. But other causes besides the rise of premium were at work to raise the freights to the danger zone?—Yes.

4319. That was partly the risk to the crew?—I do not know that the shipowner would consider that. He would look to his pocket, and he would also look to what he would get. He would get the uttermost penny he could. It was not everyone who was prepared to take any risk in the late war. Others more venturesome did so, and the freights went up.

4320. Should I be right in drawing the inference from your experience that even supposing we gave an absolute and free guarantee to our shipping in a case where we were a belligerent, you think that for other reasons the freights would still rise considerably?—Yes, I think the freights would rise very considerably. I made a note in reply to the second question whether it was advisable to make such an indemnity gratuitous or not. Now, the crux of the difficulty appears to be to place our shipowners in the same position as the neutral would be placed when we were a belligerent. The shipowner, of course, might, in exchange for a Government indemnity, be called upon to pay such portion of the estimated cost of the war risk as was not covered by the increase of freight obtainable in consequence of the war. That would be a most difficult thing to do. Then the cargo owner would also have to be dealt with. He would probably require an indemnity against loss, or detention, consequent on shipping under a belligerent flag. But on all sides you would be met with difficulties. It might very well be that the shipowner had already insured his war risk. By doing it in time of peace he can get it done for half-a-crown per cent. per annum. Another shipowner with an identical ship might not have taken this precaution, and he might be asked 20 or 30 per cent. But, as I said before, the more you go into the details the more difficult any scheme is seen to be.

4321. For the moment I was trying to get at something different. Several witnesses have recommended to us that the State should give an indemnity, on the ground that by so doing you would either do away with war risk premiums altogether or keep them at a very moderate figure; that that being so, the shipowner having no additional expense on that account, would be able to charge a very moderate freight, and our oversea commerce would go on at very similar charges to that to which it is put in time of peace. I gathered that what you said as regards the experience in the Russo-Japanese war rather went to show that, setting aside the war premium question altogether, other causes would be at work that would certainly enable the shipowners to raise freights, and therefore it would not be true to say that the freights would be kept down if only the war premiums were to be provided for?—It would have an indirect effect upon the freight, but I am afraid you would always be faced with the fact of the shipowner who is inclined to be speculative, who would run wherever he saw most money to be made, and the more complete the guarantee the greater the risk he would run. But as I put it, if you are going to do anything, supposing freights have risen so much as to more than cover the war premium, I would pay no portion of it. Supposing the freights have not risen and the premium is very high, it might be necessary to pay him a considerable portion of the cost.

4322. You do not yourself think it would be possible to work a scheme on those lines?—I do not think it would.

4323. Supposing we were to recommend a scheme of any kind, what conditions do you think should be attached to the grant of the indemnity?—There, of course, we get into a sea of difficulties. I take it that the protection or indemnity given by the Government should not be granted without the most careful consideration; that each case, or certainly each trade, must be dealt with on its merits.

4324. What exactly do you mean by that?—When a shipowner was entering into a charter he must come to the powers that be—the Committees, or whatever you have formed—and arrange with them the terms of his indemnity.

4325. Even if the State were giving a free indemnity?—But to give a free indemnity would invite the most speculative to go in. I cannot see that you can possibly work it that way. The circumstances of each case might change from day to day, or from hour to hour, as we know.

4326. And you do not think it would be possible for the powers that be to prevent too speculative risks being undertaken, by simple Admiralty regulations?—They would certainly have to be under the orders of the Admiralty, but still you would get the more speculative owner. You could not give a general cover, so far as I see. During the Japanese war, in many cases, as we know, the Governments of these two countries offered an indemnity—in fact, they gave shipowners the choice. They said, Our rate of freight is so and so, without an indemnity; it is so much less with an indemnity; and a bargain of this kind, so far as I can see, would be the only practicable thing.

4327. Then if each case had to be dealt with on its merits you would form a Committee for that purpose?—Yes, a Committee or Committees of experts to sit. The indemnity, or the cost of the indemnity, should depend upon the freight that was obtainable at that time. The shipowner might sustain no loss whatever; freights might have risen in the particular trade to such an extent that he could well afford to pay the premium. The object is not that he should have an extra profit, but that he should keep the seas. The great object is that he should be able to compete with the neutral.

4328. That his freights should be kept down?—That he should not make an extra profit by the war and also be paid for the war risk.

4329. Let me put it a little differently: that he should not incur extra cost through the war risk for which he would have to recoup himself by increased freight. It is suggested to us that either the shipowner would be able to charge, and would charge, such an increased freight as would stop commerce and prevent us obtaining goods, or, being unable to get that price back in his freights, he would be unable to run the ship, because it would become too expensive for him to do so?—I would look at it more in connection with his competition with the neutral. Supply and demand would probably adjust these other questions. But I understand the object of this inquiry is to enable the English shipowner, when his country was a belligerent, to compete with the neutral. If he got a big extra freight in consequence of the war, he might well afford to pay the whole of the war risk premium. There is one misapprehension that I have not seen corrected in connection with the Food Supplies Commission. It was put to one of the witnesses: "Am I not correct that Great Britain practically has 70 or 80 per cent. of the trade of the world?" That witness apparently agreed to it. The question, of course, has a considerable bearing on the considerations, because if there are only 20 or 30 per cent. of foreigners to consider it would be a very different thing from what the actual facts are. It is a subject that I have paid a good deal of attention to. In 1893 we appeared to have reached about the high tide of our proportion of the carrying trade. I then made it out to be about 58 per cent. of the whole, making due allowance for the difference between sailing ships and steamers. That has gradually and regularly fallen off, at the rate of about 1 per cent. in two years, until we have barely over 50 per cent. In fact, according to the last return made by Lloyd's a few weeks ago, it is under 50 per cent.

Mr. J. S. Metcalfe.

16 July 1907.

4330. (*Sir George Murray.*) That is tonnage, is it not?—Roughly speaking, our position is this. We have about half the steamer tonnage of the world, and we have about a quarter of the sailing ship tonnage, but you cannot compare a ton of sailing ship tonnage to a ton of steamer tonnage; the steamer does so much more. I therefore make an allowance of 3½. I suppose that a steamer ton is equal to 3½ sailing ship tons, and after making that allowance, as I say, we have fallen from 58 per cent. of the whole to 50 and a very small decimal point, or even below 50.

4331. (*Chairman.*) I have not got the question to which you refer in my mind. Was it not a question as to the proportion of tonnage cleared from British ports?—No; it was a question put to Mr. Douglas Owen. It was said, I think, we had 70 or 80 per cent. of the carrying trade of the world.

4332. I will take the figures in the way you give them. I think your figures are more correct. That being the proportion now, about 50 per cent., what is the inference you draw from it?—That we have a more serious competition with 50 per cent. of foreigners than we would have if that competition were limited to 20 or 30 per cent.

4333. (*Mr. Llewellyn Smith.*) It is 50 per cent. of the trade of the world, not of our trade?—Not of our trade.

4334. We are not in direct competition with an equal number of foreign vessels in our own trade?—Unfortunately, from some British ports 70 to 75 per cent. of the trade is carried in foreign bottoms.

4335. (*Chairman.*) The lumber trade especially?—No; it is more particularly the coal trade to the Baltic. I dare say the lumber trade may be, but I do not know so much about that.

4336. (*Mr. Huth Jackson.*) Although those ships are registered under foreign flags, is it not in many cases the fact that the ownership is retained by British interests?—Should I go into that now?

4337. I am only asking that by the way?—There are some cases in which the reverse holds good, as in the American combine. There are ships under the English flag that the foreigners own and a good many under foreign flags that are English. Shall I go into that now?

4338. (*Chairman.*) We will come to that later. Now I come back to your Committee of experts. They would decide the amount of premium to be paid for each particular venture?—That is the only way, I think.

4339. And the amount of indemnity in case of loss?—That is so.

4340. You recognise also, do you not, that it would be necessary in addition for the Admiralty to have certain control of what voyages should be undertaken?—Undoubtedly. I do not know whether convoy is out of fashion now, but there are questions of delay, diverting the route, and so on; there are so many details that will have to be considered.

4341. The conditions that are attached to the suggested indemnity in those printed schemes that were sent to you do not appear to you to be unreasonable?—Certainly not, so far as the Admiralty is concerned. It is absolutely necessary that there should be some

Mr. J. S. Metcalfe.

16 July 1907.

control. I suggested even the possibility of having to put a man on board, because some of these captains might disobey orders. Not that I say it is practicable, but it may be necessary.

4342. May I ask a little farther about the question of a free indemnity. More than one way of securing a contribution from the shipowner has been suggested to us. One suggestion that has been made is that there should be a low fixed charge in time of peace, say of an eighth per cent. on the capital value of the ship, and that that should accumulate as a fund out of which to pay losses in time of war. Has that idea ever occurred to you?—Yes, but why should a shipowner pay the 2s. 6d. when he can come to us and get covered without any such scheme during peace? He can do it now without going to the Government—at least, during peace time, as a rule, he can get covered at about 2s. 6d. per cent. extra for the twelve months, if there are no clouds in the horizon, I imagine; but with us he can cover any loss. Of course, he could go on paying, and the contributions could be used to build up a fund, but his ship may be sold and gone before the time of benefit comes. We thought of the same thing; we thought of making a regular charge and raising a fund, but the people who might pay to that fund might pay for years—and it is to be hoped it will be many years before there is such a war—and the others will reap the benefit. They prefer to go on; they say, it costs us nothing while there is peace, and we will make other arrangements when there is war.

4343. Might you not by parity of reasoning justify the decision not to insure your house against fire. If you have insured your house, and are fortunate or unfortunate enough not to have a fire, the benefit goes to somebody else?—I think that argument hardly applies. You would find out your mistake in the case of the house when the fire took place. You find out your mistake about the war when it breaks out, before anything does take place. The worst that can happen to you is that if you have gone on for twenty years and not paid your 2s. 6d. you may have to pay five or ten guineas; it depends on how soon you insure. But the case of the house is different. You have no notice of the fire in the house. You have notice of the war more or less.

4344. Do you think it would be easy to insure ships actually at sea at the moment of the outbreak of war?—There are always, or generally, rumours of war before the war breaks out. But there would be no difficulty except in the premium. The fact that the ship is at sea will not affect it—in fact, it certainly would happen that there were a great many ships on their voyage, and it depends where they are what the rate may be. The underwriter has to take into consideration the whole of the possibilities of the case.

4345. It has been suggested to us, and it was suggested to Lord Balfour's Commission, I think, that a toll should be put on British cargoes carried in neutral vessels?—That is going back to Cromwell's idea in 1651, but it would not effect its object, because there is an immense volume of trade carried on by British vessels between foreign ports. We could not get hold of that. That same witness would even prohibit the carriage of cargo by foreigners between all parts of the Empire in time of war.

4346. By other than British ships?—By other than British ships, yes, and he would put a tax on the foreigners that did carry from British ports. But I am afraid that that would be impracticable.

4347. I perhaps need not take you through all these suggestions, but there is one which has cropped up in evidence given before us, and was also mentioned before Lord Balfour's Committee, and that is the suggestion that the national guarantee should be for special trades only, perhaps even for special trades at special times?—If any such thing is possible it appears to be in that direction. The danger zone is generally somewhat limited. It is to be hoped it would be, and you might deal with these special ships, as I say, when they come to be chartered. Their owners would have to come to this Committee, and that is one of the reasons why I say each case would have to be dealt with on its merits. If the owner were getting a sufficient extra freight to pay his war risk, then by all means let him pay it.

4348. Of course, if the Government has to deal with each venture separately it would mean an enormous business?—Enormous.

4349. And a business of which necessarily they would have no experience in time of peace?—The Government could not do it. They would have to delegate it to experts of some kind. I should think they are badly enough "had" over their own contracts, and this would be quite beyond them.

4350. Do you think it would be possible for them to get the necessary expert assistance at a time of war?—I should think so.

4351. It might be that in time of war the underwriters and the experts generally would be just at their busiest?—I should think so. The task you would set them would be an extremely difficult one, and they would probably be blackguarded on all sides by those who did not think they had got sufficient. You would be giving them a very unpleasant task.

4352. Clearly your advice to the Committee is that they had better not touch this?—If any scheme were submitted that appeared to have the germ of success in it, it would be another matter, but I have not heard of such a scheme. I have read all the suggestions that were laid before the Food Supply Commission, and I see nothing that is practicable, and my own personal experience is against it.

4353. I quite understand your general view, but let me ask you one or two questions of detail. Supposing we did desire to recommend something, do you consider that the basis for calculating the amount of the indemnity in case of loss suggested in that Scheme A we sent you is a fair one?—That is, the insured value of the ship?

4354. Not the insured value of the ship—the actual value of the ship; it might be a different thing from the insured value?—I am afraid you would be asking this Committee to do more than is possible. At the present time underwriters accept the values of ships pretty much as the values are put before them. But, of course, if the shipowner had to pay a portion of this premium, that would deter him from making the value too high. Taking it all round, I should think the insured value is probably better than what you call the actual value. The greatest difference of opinion occurs even between experts as to what the actual value is.

4355. Of course, the object of a scheme would be to secure the arrival of a ship and its cargo. We want the interest of the shipowner and of everyone concerned to be that the cargo in the ship should come safely to hand?—Yes. That, of course, was the object of the Food Supply Commission, but I understood that the first object of this Committee was to enable Great Britain to keep the seas in the event of a war in which she was a belligerent.

4356. They are both objects?—Exactly.

4357. If we are thinking of getting the ship safely home we ought to make it to the interest of the shipowner rather to get home. It should not be a matter of indifference whether he gets home or whether his ship is lost?—Yes. I do not know whether, in connection with that, you are aware of a discussion that took place before the International Law Association at Rouen. I contributed something to it. Two questions were put forward. The first question was, With immunity or without immunity. The second was, Indemnity on a reduced valuation, with licence to put to sea. That brings in, of course, what Admiralty regulations might be necessary. But when you begin to suggest a reduction of value, the effect of it is that the shipowner insures the balance if he thinks he is not sufficiently covered. If you put his property down in value he says: "That is not sufficient for me; before I accept these terms I must see what I can insure the balance at"; and he goes and insures it. As to restrictions at sea, that brings us back to the question of Admiralty control.

4358. In the *précis* you have been good enough to send us you say that attention has not been given sufficiently to the unwillingness of seamen to take the risks?—The extraordinary difficulties that there were with the crews in the Russo-Japanese war suggested to me how much greater the difficulty would be when we were at war. When we were neutrals, crew after crew refused to proceed when they got into Singapore and Hong Kong, and in some cases Chinese crews were shipped while they went to the Japanese ports, and the ships returned and picked up their English crews. Again, as you have seen, a great many actions were commenced by these men for their wages. Of course, they imagined all sorts of things. When you are near the theatre of war you hear all sorts of rumours, and I

can fully imagine that in case of England being at war you might have very serious difficulties. Then, of course, we must not blink at the fact that a considerable number of our crews are foreigners.

4359. So far as they were Englishmen, I imagine they would be more ready to take these risks if we were a belligerent than if we were neutral?—I think they would say, "You have been very good to the shipowner, you have covered him and the cargo owner, but what about me?" The seaman would say, "This is a purely mercantile affair; if I were fighting for my country I would be as ready as anyone, but to convey merchandise for perhaps a foreigner in order that British merchandise may keep the seas is quite another matter." There is very little doubt, I imagine, that many of them would refuse.

4360. Or require an indemnity for themselves?—You can give an indemnity where money only is concerned, but a lot of these men of course do not know what treatment they may experience, and the Russians set a bad example. They torpedoed boats, and acted in a very high-handed manner even where the cargoes were supposed to be neutral.

4361. On the whole, therefore you would say that our only security is a strong navy?—Yes, our main security.

4362. That is the only effective security we can give to enable our ships to keep the seas or our supplies to arrive?—I think that Government too might do a very great deal to assist us, more particularly by a definition of contraband. That has been our greatest difficulty throughout. Every owner that had a ship likely to go to the East came to us with all sorts of questions. We went to the Foreign Office and asked, "Are these goods contraband?" The Foreign Office did their very best to help us, I understand, but they were extremely afraid of committing themselves. The Russian declaration as to contraband speaks of naphtha. We asked, "What is naphtha; what is the translation; what is the Russian word used?" This led us up to oil. In addition to that, three of our ships were destroyed by the Russians, and in some cases I consider the treatment that has been dealt out to the owners is little short of scandalous. One ship had a cargo of oil. She was boarded just the day before the battle in the Straits; they dug down about 12 feet into this case oil, but they could find no contraband; they took her nevertheless, and managed to run her ashore and set fire to her. The case has dragged on in the Russian courts. That was in 1905. After a lapse of two years judgment was given by the Court of Libau in favour of the shipowner, that the cargo, being oil, was not contraband. A verdict apparently was given for £60,000 out of £68,000 claimed by the shipowner, and he thought he had little to do but collect the money. Some time afterwards, about a month ago, there was a telegram from his lawyers saying they had been suddenly called to some other port, where a new Commissioner had been appointed. That was followed by another telegram that the Russians described the cargo as "petrole" and repudiated everything, and our Government apparently stands by and does nothing.

4363. I quite understand the importance of the definition of contraband, but that also is a difficult subject?—Very difficult.

4364. And it hardly comes within the scope of our Committee. But those questions apply much more in the case where we are neutral than where we are a belligerent?—Yes, except that by the Declaration of Paris which took us on to the ice, and left us there pretty well, the neutral flag covers the enemy's cargo except contraband. You always run up against this word "contraband" in every difficulty that arises.

4365. And therefore the wider the definition of contraband the greater the disadvantage to the neutral?—Yes.

4366. And therefore the less he is at an advantage compared with one of the belligerents?—Unless it be, as we have rather a strong feeling, that the Germans, for instance, ventured to run a considerable risk as to what was contraband, because they believed that they would obtain, and they did obtain, the support of their Government throughout. The Hamburg-American Line is said to have made £500,000 out of the war, and there were undoubtedly a great many cases where English shipowners hesitated, and others, who thought they would get more support from their Government, took the risks.

4367. In a case where we are a belligerent you anticipate that the British Government would give its shipowners what support it could?—Except that the British Government has not done so very much at present. The manner in which the British Government allowed its ships to be stopped rather encouraged that proceeding, I think.

4368. In that war we were not a belligerent?—We were not, but we allowed our ships to be interfered with in a manner which I think might have been stopped. I see the Germans even in this Hague Conference are endeavouring to define contraband.

4369. (*Sir George Clarke.*) I see you say your Indemnity Association covers £21,000,000 sterling?—Yes.

4370. In fixing your contributions or premiums, what estimate of loss have you worked upon?—We make no estimate whatever. The amount payable by each member depends upon the amount of loss. The loss is divided *pro rata*. It is simply a mutual Association. If there is no loss there is nothing to pay. If there is a heavy loss it is all *pro rata* on the amount insured. We only take up to £50,000 now. We had a much larger capital before, and we took the whole value. It was considered best to make it £50,000. The member contributes on the amount he enters, whatever the amount of the loss may be.

4371. If there were a loss of 5 per cent., which would be over a million, in the first few weeks of war, would that be met out of reserves?—No; there are practically no reserves. We thought of that idea, but that was abandoned. A call would be made on the members for this 5 per cent., and everyone would pay on that amount.

4372. You would make a call to meet the liability?—We would make a call, yes.

4373. Is the policy that your Association issues such that banks would be prepared to lend upon it during a war with a great Naval Power?—There is one great difficulty that I refer to, the Stamp Act.

4374. (*Chairman.*) May I interrupt you to say this? You saw probably that the Chancellor of the Exchequer the other night said he was going to deal with that point?—I did not see that; I am glad to hear it.

4375. He said a reason for not touching it this year was because this Committee was sitting, and that our recommendations might affect it, but that he intended to deal with it next year?—We at present stamp our policies with a penny stamp. That is only valid to the extent of 2s. 6d. per cent. upon the amount insured. It would not be a legal document beyond that. We have a rule by which we endeavour to meet that difficulty, but bankers would doubtless demur. They would say, Here you have given me a policy with a penny stamp upon it. I want one with a sixpenny stamp upon it, to give me a full cover.

4376. (*Mr. Beauchamp.*) 6d. per cent.?—6d. per cent., yes, which would cost us £5,000 per annum on our capital, and we have not done it yet. But we have got a rule by which we have tried to meet the difficulty. I do not like the rule, but we do our best. When the emergency arises we would issue a policy with a sixpenny stamp.

4377. (*Sir George Clarke.*) And the probability is that bankers would only lend to your clients up to the amount represented by the stamp?—I should imagine so. I think, for all ordinary claims, barring the stamp duty, the security would be as good as they would get at Lloyds.

4378. From the point of view of the banker?—From the point of view of the banker, always apart from the stamp difficulty.

4379. Do you impose any conditions as to navigation in war time?—Yes.

4380. Are they strict?—They are varied from time to time. At the present time we do not insure any vessel, even yet, that is in the neighbourhood of Port Arthur and Vladivostock. We have a special rule not only not to carry contraband, but we have exceptions of that kind, and the rules have been varied from time to time, and would be varied according to the danger zone.

4381. You say that the practicability of indemnity was shown to be doubtful by the experience of the Russo-Japanese war. Why was that?—Because we found that all owners that were likely to get these big

Mr. J. S. Mitcalfe.

16 July 1907.

freights came to us and said, "Now, are we covered?" If they got an answer in the affirmative, they seemed willing to run any risk whatever. They wanted the big freights, and they wanted someone else to cover the risk, if possible.

4382. But you see the case is special, because all these cargoes that it was desired to cover were being either run into a blockaded port—Port Arthur—or in any case into an enemy's port. That is not the case we are considering in time of war?—No, but there are certain trades where the risk would be very great, and shipowners would go into that trade if they could get an indemnity from the Government. Freights would naturally rise, even for the neutral. The neutral would have to pay some war premium. Of course, the belligerent would pay more.

4383. But you see there is a distinction between cargoes sent to a blockaded or a belligerent port and cargoes which are not sent to a blockaded or a belligerent port?—Undoubtedly.

4384. I think you said it was desirable to put British shipowners on an equal footing with neutrals, but I think afterwards you told the Chairman you did not think that was practicable?—I still say it is desirable, and I still say, so far as I can see, it is impracticable.

4385. Then, with this large Committee which is to settle what trades are to be discriminated in favour of, there would not be time, would there, to deal quickly with the many claims that would arise. That would cause great delay?—That is extremely probable, and that is one of the difficulties which makes me say it appears to be impracticable.

4386. It might have the effect of delaying the movements of shipping?—Undoubtedly it would have that effect, I should say, and the Government would have to pay for it. Detention would be one of the most difficult things to deal with, because we constantly have claims for alleged deterioration of cargo, loss of market, and so on. You have nothing to teach a merchant as to making claims.

4387. You said that if a fixed charge of 2 per cent. for a Government indemnity were made it would only be effective if the rates went above that amount?—I think so.

4388. But is not that exactly what is required, the State to come in, if it comes in at all, just when the rates in the open market were becoming so burdensome that the shipowner could not continue his business?—But if the shipowner were to get an adequate freight which would cover the excess, why should he be paid even this 2 per cent? The idea is not to enable shipowners to make profit but to enable British shipping to keep the seas. Therefore, if in consequence of the danger of this particular trade the freight had gone up so that the shipowner could well afford to pay the war risk premium, why should the Government pay the 2 per cent.?

4389. We have been told that the rates in the open market might rise so very high that nobody could carry at all?—I cannot answer for that. Our fleet would have to be in a very bad condition, I should say, before that arose.

4390. You think that the open market would always be able to cover the risks provided that the mercantile interests were able to pay the premiums asked?—I think so.

4391. There would be no restriction of that market?—I think not. Underwriters are all ready and willing to make money if they can see their way to do it. There is no such thing as a combination amongst them.

4392. You gave us a percentage of British ships and neutral ships in the carrying trade, but the whole point would be whether the neutral ships could carry on a large part of our trade, and at the same time carry on the trade they were doing before?—That is so.

4393. Would there be sufficient neutral ships to do that to any great extent?—As I say, I imagine that in all human probability the war would be confined to certain zones, and the English ships outside of that might go on with their business as before, pretty well. You, however, could imagine all sorts of things. Freights would doubtless rise.

4394. But you agree that it is only the surplus shipping of neutrals, the shipping not ordinarily employed, which could come in and compete with us in war?—They would be attracted by the freight they could get. They would probably leave any trade they were in to get the more remunerative freights.

4395. But that would leave our other shipowners able to take over the trade they left?—That might be so, if it were in a district that we could safely navigate.

4396. You have spoken of the reluctance of British seamen to sail in belligerent ships. Would not that also be operative in the case of neutral ships carrying contraband?—To some extent, just as the neutral has to pay a war premium, but the belligerent has to pay a very much heavier war premium. The seaman, while he was under a neutral flag, would know that there was certainly less chance of capture than if he were under a belligerent flag. Then that brings us to the question of transfer. I do not know whether you wish me to speak of the transfer to foreign flags.

4397. I was going to ask you whether you consider there is any great risk arising of a wholesale transfer to a foreign flag?—Not perhaps wholesale, but this is done, I believe, to a very considerable extent for other reasons. Thirty years ago there was a firm in Newcastle that issued a circular—it was about the time of the Plimsoll agitation—offering to transfer ships to foreign flags. There was a great row about it, and I have not seen anything of that kind since, but their idea then was to find a foreigner who was willing to be registered as owner, and to take a mortgage upon the ship as security. There were obvious difficulties, and that was found not to work. Since that, in consequence of the restrictions that have been made applicable to English ships only, a very large number of vessels have been transferred—first of all to the Norwegian flag. I am told that recently they have become much more particular there, and also that they are talking about—or have arranged—a load line, and therefore it appears to have stopped to a considerable extent, so far as Norway is concerned. Denmark puts a duty of some 3 per cent. upon transfers, and therefore there is very little in that direction. But Sweden, I understand, is very anxious at the present time to increase her mercantile marine, and there it can be very easily done. I have a considerable list of ships that are really managed by English owners, and that are under these flags. A foreigner is registered, a Swede or Norwegian, as the case may be, and you will find his name in Lloyd's book. If that could be done, and if the war was long, it would be almost a natural thing; the shipowner would see that, if he were under a foreign flag, he then could carry cargoes as a neutral that he could not carry so long as he was a belligerent. Take this large American combine: if England was at war and America were a neutral, what more natural than that these ships should go back as they are really owned in America? Of course, an Act of Congress would be required, but that is very soon done. They have done that in two or three cases.

4398. But all these transfers you have spoken of are transfers carried out in time of peace, and you realise, do you not, that the difficulties of transfer after war has broken out, would be very considerable?—Few belligerents, I should think, would like to get into trouble with another nation by interfering with ships under a neutral flag. Take such an instance as the combine; it really is only giving back to America what belongs to that country.

4399. I think your evidence may be summed up that you think both free and purchased indemnity would be equally impracticable?—I think so.

4400. But of the two you would prefer that something should be paid, rather than that the guarantee should be free?—That is so.

4401. You say in your *précis* that every assistance in the direction of self-help should be afforded to British shipowners? What assistance can the State give in the direction of self-help?—First of all this definition of contraband, I think, would be extremely valuable. The associations would then know how far to go.

4402. Of course, you know that is what we are trying to do at the present moment?—I was not aware. I am very glad indeed to hear that.

4403. Is there anything else?—There is the Stamp Act, of course, which you say is also under consideration. Then I think everything where life is concerned should be put on an international basis. British shipowners are at a great disadvantage in consequence of that not being the case. The removal of these disad-

vantages would at once stop transfers at least, as far as the present time is concerned.

4404. By help, you do not mean help in the shape of giving instructions to guide the movements of ships during time of war?—We have made approaches to Government. We have a rule by which each member is requested to keep us fully advised to the whereabouts of his ships. We think we could be of very great assistance to Government in case of war.

4405. But you expect Government also to be of great assistance to you by giving you all the information they can to help you?—It might be mutual to that extent.

4406. (*Mr. Beauchamp.*) The North of England Protecting and Indemnity Association makes a charge for all steamers which are entered in their society?—A small entrance fee.

4407. A small entrance fee of 2 guineas?—Yes.

4408. And the value of the steamers entered is limited to half a crown per cent.?—The liability of the Association is limited by the stamp duty to 2s. 6d. per cent. at the present time.

4409. I see by your rules the liability of any member is limited to half a crown per cent.?—That is the Stamp Act difficulty. We have a rule that when, in the opinion of the directors, the claims are likely to exceed half a crown per cent., fresh policies shall then be issued without any such limit, and it is the only way we could see of getting out of the difficulty.

4410. But it would have to be by resolution of the directors. You cannot extend the liability of your members without a direct resolution of the directors?—Not only a resolution, but the issue of these policies.

4411. But I mean to say it can only be done by a resolution of the directors?—Yes.

4412. That is a necessity; and would it have to be a unanimous resolution of the directors?—Supposing the unlikely thing that the directors were to refuse any such thing, it would be left to the members; there would be an appeal to the members.

4413. And have the members any right of objecting to the increase of their liability?—We consulted counsel; we said—Here is the difficulty of the Stamp Act. Show us our way best to get over it. The rule is the consequence; the rule is as I have stated.

4414. 2s. 6d. per cent. would only yield £26,000, roughly?—That is so.

4415. And would the members of the association have the right to retire if the directors passed that resolution?—Of course, there is no doubt this is the difficulty we were in. We waited upon you in reference to this very subject. We said—We are not satisfied with our rule. We think it a hardship that when a ship is insured and the full stamp duty is paid upon the insurance of the hull, a full stamp duty should also be exacted for the war risk. We appealed to the then Chancellor of the Exchequer, and perhaps you will recollect you read out to me the very rule that we have adopted, and we were satisfied with that. We said: "Very well, if that is so, that is all we want."

4416. (*Sir James Mackay.*) Does the North of England Protecting and Indemnity Association insure vessels against total loss?—It is not an insurance on hull at all.

4417. You simply insure for what shipowners cannot cover under the ordinary policies, I suppose?—That is practically so. The association is divided into three classes. The first one covers mainly the one-fourth deducted under Lloyd's Collision Clause. Class 2 covers claims made by owners of cargo arising without the fault or the privity of the members. Class 3 steps in for war risks. They all contribute to the general expenses, but the members of each class are only liable for the risks of that class, and Class 3 covers war risks.

4418. I think you said there was a considerable rise in freights to Japan during the Russo-Japanese War?—Yes.

4419. Do you think that was the case really, when you come to think of it?—I know Mr. Runciman, whose evidence I have looked at, quoted a rise of from 17s. 6d. to 25s. In fact, we know there was a considerable rise. I am not a shipowner, but I imagine there was a considerable rise.

4420. I do not think there was much rise in freight of cargo that was not contraband?—With the declarations made by the two belligerents it was difficult to say what was not contraband.

4421. You see there was very little risk run practically; cargo mostly went from India to Japan, and there was very little risk of capture between India and Japan until the Baltic Fleet got out?—Capture by the Russians?

4422. Yes?—Yes, that may be so. That is why it varies in every place. It depends on the circumstances.

4423. Then with regard to the proposal that the Government, in return for an indemnity, should make a charge during time of peace. I do not think Mr. Chamberlain mentioned that it was proposed to make it compulsory. You asked why should a shipowner pay that charge when he could get insured either with you or not be insured at all, where there was no risk of war. The idea, I fancy, some of the witnesses have had was that the charge should be made compulsory. Do you think that would be welcomed by the shipowners?—Nothing compulsory, I think, would be welcomed by the shipowners.

4424. Then, I think, you said that the idea in giving an indemnity would be to try and keep British vessels at sea during time of war?—That, as I understand, is an object in view.

4425. Of course, there would not be much object in keeping British vessels at sea unless the seas were safe?—It might be when the seas were not safe to belligerents that you would want them to keep the seas.

4426. Suppose we were at war, there would not be much object in sending ships to sea down the Mediterranean, for instance, if the Government was not keeping the Mediterranean clear?—That would have to be left to the Admiralty to say when and where they should go. But that is why I cannot see that an indemnity is workable.

4427. Then you thought if the Government decided to give a national guarantee in time of war it would be necessary to compensate owners of steamers for delays when they were tied up by the Admiralty?—I think so. It is part and parcel of it. You can hardly ask them to wait unless you are going to pay for the waiting.

4428. So that if a ship is tied up at Port Said for a fortnight or a month by the Admiralty, and not allowed to sail because the Mediterranean is not safe, you think the owner should be compensated?—I think so. We have a rule, I may say, in this war risk class that when vessels are detained they shall be paid at the rate of 2d. per ton per day for such detention.

4429. It would be reasonable, I suppose, that the shipowner should be compensated, because he would be tying up his ship in order to save a possible loss to the country?—Yes, and in the same way he might have to go some longer route to arrive at his destination.

4430. And then he should be compensated too?—Yes; but fancy the claims for perishable neutral cargo you would have in a case of that kind.

4431. In regard to the difficulty in getting men to go to sea in British ships if we were at war, do you think there would be an indemnity wanted by the men too?—Not an indemnity; they would want more wages.

4432. They would want rather a bonus than an indemnity?—I do not know. I think in the old wars the wages went up to £10 a month. It is inevitable almost.

4433. And you would not consent that the Government should give the men an indemnity?—I say it should be taken into account in the settlement with the owner. If the Government not only has to settle with the shipowner and with the cargo owner, but also with the men, it renders any scheme still more hopeless. But that will be one of the points for consideration before the shipowner makes his bargain with the Government. He will want to know what his crew is going to do; what he is going to pay them. There is no doubt that, risk or no risk, the men would think it a very favourable opportunity of getting a very much higher scale of wages. That has always been our history.

4434. You spoke of the possibility of its being necessary to put a Government man on board the ships?—Looking about for some solution of the difficulty, it occurred to me it was necessary, because I know what

Mr. J. S. Metcalfe.

16 July 1907.

some of these ship captains are, and what stupid things they sometimes do.

4435. Would it be a naval officer?—Yes, it would have to be a competent naval officer.

4436. Who could give directions to the captain as to the course he should adopt?—Yes, I do not for a moment recommend such a thing, but it is just one of the safeguards.

4437. (*Mr. Huth Jackson.*) I understand that your association only insures the ships?—Yes.

4438. They have nothing to do with cargoes?—Nothing to do with cargoes.

4439. And the value of the steamer for the purposes of indemnity is assumed to be the amount that is insured by an ordinary value policy on hull and machinery?—That is so. At one time we used to take extra amounts—consequent on a very bad principle that shipowners have adopted—against total loss. But we got into such difficulties with these extra amounts that we now simply go on the ordinary policy value, irrespective of p.p.i policies.

4440. That insured value is, I understand, not infrequently more than the actual value of the ship?—I have no doubt it is, but also, in consequence of this objectionable plan to which I refer, it is very often less than the value of the ship.

4441. So that, on the whole, as an average, you think it would be the best way?—I think so, more particularly as most of the hulls are insured for time, and this value would probably be fixed before the owners knew exactly what was going to take place about the war. It is something done beforehand, not premediated.

4442. It has been suggested by some witnesses that a fair valuation to be taken by the State, if a scheme of national insurance were adopted, would be the cost of the vessel, less so much depreciation per annum, since the time when she was finished?—That may be a rough and ready way; but a few years after a ship is built she may be worth a good deal more than what she cost, and, on the other hand, 5 per cent. may be totally inadequate. Ships may in a year or two be worth half what they cost. It is a most difficult thing, as you doubtless know.

4443. However, there would be no objection, I presume, to the owner insuring excess values if he thought he was not fully covered?—I hardly see how you could prevent that. Then, of course, that would take from him the interest that he might otherwise have of being careful.

4444. But in any scheme, if such were recommended, would you suggest there should be a prohibition to a shipowner to insure outside in excess?—I think it would be useless to make any such prohibition; it would be unworkable.

4445. In your own case the liability of the association is limited to £50,000 in any one particular ship?—In this way, that if the ship is valued at £100,000 we only take £50,000. That is our limit; that is our line.

4446. Then do you permit the owner to insure the excess elsewhere?—Undoubtedly.

4447. And therefore, in any national scheme, you would permit the owner to insure elsewhere?—Yes.

4448. You indicated in part of your evidence that you thought the State should not interfere if the owner of the ship was able to secure, by increased freight, the amount of the additional cost of the war premium?—That is my opinion.

4449. But you are, of course, aware that one of the objects in view is to prevent the increased cost of food and raw materials coming to this country, due to highly increased freight?—I was not aware of that. That was so in connection with the Food Supplies Committee, but I understood the question you were dealing with was the best means of preserving the seas to the British ship.

4450. That is one of the questions. Another one was the question of securing a constant supply of food and raw material, and, if possible, to prevent the enhancement of the cost of those to this country beyond what would normally happen in time of war?—That would have to be dealt with by this Committee in each case, I presume.

4451. But you admit, do you not, that the shipowner would always try to place on the freight any increased charge which he has to pay?—Well, whether he had increased charges or not, he would get the biggest freight he could, under any circumstances.

4452. And he would always, in any circumstances, take steps to see that he would get that increased amount of his out-of-pocket expenses—say the increased insurance premium?—That would be one of the considerations in entering into a charter.

4453. To go back to the object which you mentioned particularly, that is, to keep the sea during time of war, it is clear that the British shipowner would have to pay a higher rate of war insurance than the neutral vessel?—Undoubtedly.

4454. Further, he would have to pay higher wages than the neutral vessel?—I think so.

4455. Therefore, he would be at a distinct disadvantage in the carrying trade?—Undoubtedly. Apart from that, the owner of a neutral cargo would naturally prefer, all things being similar, the freight being the same, the neutral ship to the belligerent ship. He would say: "I do not know what difficulties I may get into here, in spite of guarantees." All things being equal, I imagine he would prefer the neutral.

4456. Therefore, if, as you say, he would prefer the neutral at equal prices, then, if the British ships are to keep the sea, the inference from what you say would be that the British ships would have to be in a position to carry the cargo at lower freights than the neutral?—They would.

4457. Unless something is done that is obviously impossible?—Obviously impossible that they could carry at lower freights?

4458. Yes?—Not quite. Supposing freight has gone up unduly beyond a payable rate, and that they can secure such a freight as will cover all these contingencies—the extra wages to the crew, the war risk, and everything else—the profit to that shipowner would be equal to what he would make on an ordinary voyage in times of peace.

4459. Yes, but the neutral would do better?—He would make more money, probably. One would make so much more than the other, but it would still enable the British ship to keep the seas, making less profit than the neutral.

4460. You think, therefore, that the British shipowner might still, without any such scheme of national insurance, as has been suggested, be able to charge a less freight than the neutral in time of our being at war?—Instead of using the words "being able to charge," I would say "be able to get." He might be able to get a sufficient freight to cover all these contingencies you are speaking of.

4461. And that freight might be still less than a neutral would be willing to take?—Yes. I want to draw the line, that you are not going to advise a scheme to enable the shipowner to make more money. You are simply going to advise, if you advise it at all, a scheme to enable them to keep the seas, not to be driven out of the market altogether.

4462. I understand you yourself have been acting as an underwriter for many years?—Yes.

4463. As an underwriter, what would you say would be the period when war premiums were likely to be highest?—That is impossible to say. The period would be when we were most defenceless on the sea. It would not only be a period, but a place. There might be no risk at one quarter of the globe, and enormous risk in narrow seas. There are so many questions. In fact, it varies from day to day, as I say. The appearance of a man-of-war in the Channel, or off the Chops of the Channel, would make all the difference.

4464. To speak generally, would not the most panicky period in insurance be just prior to the declaration of war?—No, I should think not. The most panicky period, I should imagine, would be after a few captures.

4465. I was going to say, just previous to the declaration of war, when the fear of war was imminent, and then during the first few weeks, or months, say, of the war?—That hardly follows.

4466. Until the British fleet had been able to assert itself?—Yes, but the awkward part would be if the British fleet was not able to assert itself in a certain

quarter. Everything depends on the circumstances, and the underwriter must study these questions, and he asks a premium that he thinks is adequate.

4467. You said there had been a good many transfers to foreign flags in recent years owing to the restrictions on British shipping, which are not imposed by other nations?—Yes.

4468. Could you briefly state what those restrictions are?—I should think the most potent factor is the load line.

4469. Are there others as well?—I do not know whether this Compensation Act has had any effect—it is too new; and Germany, of course, has a Compensation Act—but I imagine that the principal objection on the part of certain classes of ships has been partly remedied. After many years we have gone back again, and given certain ships a deeper load line, and therefore the object in transferring them may have disappeared.

4470. But with the exception of the load line regulations, there are no other restrictions imposed here of a serious kind to the disadvantage of British shipping?—There are a great many minor ones, but I imagine nothing of so serious a character. But, of course, in war time, if a neutral, you could go anywhere; you get your freedom at once if you can manage to transfer.

Mr. J. S. Metcalfe.
16 July 1907.

4471. Under the Merchant Shipping Act of 1906 the load line difficulty has largely disappeared?—That is so, and other countries fortunately, but very slowly, are adopting load lines. Germany appears to be on the verge of it, and also Norway, I believe, but, so far as I know, not Sweden. If you take away the object of transferring you can stop the transfer, but it is very easily done, and, I imagine, to a greater extent than we believe.

4472. In peace time?—In peace time. You spoke about other objects. They get their crews cheaper. They get the provisions cheaper. It very easily came about, as you will see. The first thing was that, with the load line, a great many ships had to be sold, because they no longer could be worked at a profit. But these owners were rather surprised to see the same ships appear again in the very trades from which they had been taken, and they were being navigated and making a profit. They said "How is this," and they began to look into it. First, the ships carried 200 tons more cargo, and paid less to their crews. The British owner therefore thought: "If that is the case, why should we not transfer our vessels to the foreign flag and do likewise?"

Mr. Charles McArthur, called and examined.

Mr. C. McArthur.

Mr. McArthur, in a preliminary memorandum,* had submitted:—

(1) That there are considerable facilities for the insurance of war risks by companies and private underwriters in the United Kingdom.

(2) That, nevertheless, a system of national guarantee for the war risks of shipping is desirable on grounds of expediency, owing to the dependence of Great Britain upon supplies of food and raw material obtained oversea, but only pending an international arrangement for the exemption of private property at sea from capture.

(3) That having regard to the fact that a national guarantee would place property at sea in a preferential position to property on land, such an arrangement should be limited in its scope, and should not extend to British vessels engaged in trading between foreign countries; but that it should cover all vessels proceeding to or from the United Kingdom, or proceeding from one foreign or colonial port to another in ballast, or under charter to load a cargo for the United Kingdom; provided that these vessels were in no way unsuitable for foreign commerce, nor engaged in any trade which might be adjudged detrimental to the security of the United Kingdom in time of war.

(4) That Scheme A is preferable to Scheme B.

(5) That under the rule *causa proxima non remota spectatur*, which applies to all contracts of insurance, the State should not be liable for the indirect results of hostilities or for the effects of any aggravation of marine risks which might be due to hostilities, and that there would be no difficulty, therefore, in distinguishing between war risks and marine risks.

(6) That the transfer of trade to neutral flags is to be apprehended in time of war, since shippers will naturally prefer to ship their cargoes under a neutral flag.

(7) That values for indemnity should be:—

(a) In the case of the ship, for total loss, her value at the commencement of the voyage, subject to deduction in respect of any loss or damage sustained prior to capture, otherwise than by hostile acts.

(b) In the case of the cargo, its value on shipment, being invoice cost, including shipping charges and freight paid in advance, if any, subject to deduction as in the case of ship.

(c) In the case of the freight, the gross amount at the risk of the shipowner, less any saving in the ordinary working expenses of the voyage arising from the capture, subject to deduction as in the case of ship.

(d) In the case of other interests the value should be the same as that fixed by law in the case of an open (unvalued) policy.

(e) In the event of the Government granting certificates of indemnity, it might be left open for the Department concerned to agree a valuation with the parties guaranteed, and insert same in the certificate.

(f) In the case of average (*i.e.*, partial loss), whether particular average, general average, or salvage or other charges, the amount recoverable under the guarantee should be the same as that which would be recoverable under an open (unvalued) policy in Lloyd's form, against war risks only.

(8) That in the case of ships bound to a port of call it should be incumbent upon the owner of the cargo, as a condition of recovery, to prove that it was at the time of capture the property of a British subject, and that its ulterior destination was a port in the United Kingdom.

(9) That the Board of Claims should consist of about five members, aided by a staff of specialists to examine the claims in detail, and that appeal should be allowed to an arbitrator.

(10) That Admiralty control should interfere as little as possible with the ordinary course of trading, and that no delay in sailing, or deviation, should invalidate any claim under a policy of insurance on the property.

4473. (*Chairman.*) You are of opinion, I think, from the *précis* you were good enough to send me, that ample facilities exist for the insurance of war risks?—There would be if all underwriters took war risks, but I understand that many underwriters decline to engage in that class of business, and I think it is very doubtful whether those underwriters who do take these risks are sufficient to constitute an adequate market. In any case, the business is looked upon as a speculative class of business, and naturally underwriters are anxious to get as high a premium as they can, and, speaking generally, I think the premium is in excess of the risk.

4474. When you speak of an adequate market, you have in mind a market large enough to secure proper competition?—Yes, quite so.

4475. Is there sufficient capital behind those underwriters and companies who take war risks to make their guarantee a good one?—So far as it goes, certainly.

4476. And would it go far enough to cover the British Mercantile Marine?—No, I do not think it would.

4477. Then do you think that without any system of guarantee, suppose we ourselves were a belligerent, a part of the British mercantile marine would have to

* *Vide* note, p. iii.

Mr. C. McArthur.

16 July 1907.

go without a war policy?—Yes, I think so; and I think also that the rates on that portion which is insured would probably exceed, as I have said, the value of the risk; that is to say, that the owners of the property would have to pay more than the real cost of insuring the thing which is offered for insurance.

4478. Then I infer from that you would be in favour of some system of national guarantee?—Yes, I am very strongly in favour of it, as an alternative to an international arrangement for the exemption of private property at sea from capture. That, in my opinion, is the true remedy for the evils complained of, but as that seems at present to be not within the sphere of practical politics, I certainly think it is desirable that there should be a system of national guarantee.

4479. I will not go into that question, because it is outside the scope of our reference, and for the purpose of our reference I will assume that international law remains what it is?—Quite so.

4480. You think, then, that some form of national guarantee is necessary for a country so largely dependent upon oversea supplies as we are?—Yes.

4481. Necessary in order that we may secure a continuance of those supplies in war?—Quite so. May I give the reasons very briefly which commend themselves to my mind. I may commence by four reasons. First, it is necessary to prevent violent and sudden fluctuations in prices of commodities. I take it that we, as a country, are mainly dependent for our supplies of food and raw materials upon supplies obtained oversea, and that in the event of a great maritime war, although there may be no danger of the supplies being cut off, there is a danger of such fear of their being cut off as would lead to a great increase in the cost of insurance, which would go naturally into the price of the commodity, and might cause such an increase of prices as would press very severely on the mass of our people. Then, secondly, to insure the maintenance of an efficient Navy. It is often said that what we pay for our Navy is a premium of insurance. That I believe to be the case. If that be so, then we ought to get for that premium of insurance adequate protection. To get adequate protection we must have the protection of our trade and commerce. Then thirdly, the most equitable mode of defraying the loss which must result from captures at sea. The nation must defray that loss in some form, and under the present system it goes to increase the price of commodities. It goes into the insurance, and then into the freight, and then into the price of the commodity, and so presses upon the masses of the people, and most upon the neediest. I should say further it is swelled up by the profit which the underwriter must make. Therefore I think it is better that the loss should be limited to the exact amount of the loss, and that should be treated as part of the war taxation. Then, fourthly, the protection of our shipping trade. I consider that the shipping trade is of the utmost importance to the country. The trade and commerce of the country is dependent upon our shipping trade, and anything which was calculated to injure or destroy our shipping trade would be a blow to the prosperity of the country. On these grounds I think a system of national indemnity is greatly needed and would be very valuable.

4482. Would you say that any one of those grounds was more important than the other?—Yes; I have put them in what I consider to be their relative importance.

4483. May I ask about the first ground, that it is necessary to avoid sudden and violent fluctuations. Suppose we had a scheme of national guarantee, and that it worked satisfactorily, would that by itself be sufficient to prevent those sudden and violent fluctuations on the outbreak or after the outbreak of war?—I think it would, of course, assuming that our Navy was sufficient to hold command of the seas.

4484. It has been suggested to us by some witnesses that one of the first results of the outbreak of a great European war in which we were a belligerent would be something very like a panic in the City, great withdrawals of gold, great disturbance of the money market, resulting perhaps in inability of bankers to meet their liabilities. If there were anything of that kind, or even if a fraction of that came true, those circumstances would affect prices very much more than the mere cost of insuring against risks, would they not?—I should say that those disturbances would arise rather from speculative causes, and therefore they would be only temporary.

4485. They might be very serious while they lasted?—Yes, that might be very serious, but it is a pure matter of speculation.

4486. They might involve a suspension of specie payments?—I should think myself it would be very unlikely. But that, of course, is, as I say, a mere matter of conjecture. I should think, having regard to our financial position, that any disturbance of that character would be speculative and temporary.

4487. To proceed to another question, you suggest that this would be a more equitable form of defraying the loss than the present system of allowing the losses to percolate through insurance and freights to the consumer. You would apply the system of indemnity to the cargoes as well as to the vessels, I suppose?—Certainly.

4488. Your object is evidently to secure our supplies of food and raw materials?—Yes, to prevent a sudden or great rise of prices.

4489. But would you think it possible to exclude from the indemnity other forms of cargo than food and raw materials; luxuries as distinct from necessities?—I do not think it is worth while going into that.

4490. You would therefore cover, for instance, such imports as diamonds?—Yes. My feeling is that if an indemnity of this kind is to be given it should be a full indemnity. It would be a mistake to do things by halves, and you must look not only at your immediate object, which is, of course, to prevent food and raw materials from rising in price, but also you must look at the outcome of that import trade, which is the export trade. The two go together, and you cannot safeguard the one and leave the other unprovided for.

4491. I quite agree. I only wanted to call your attention to the fact that you would be distributing among the taxpayers at large, not merely the charges on the necessaries of life, but charges on luxuries and superfluities, which at present would go to the consumer—that is, to a very rich man, not to a poor man?—That is a very small matter indeed, and, of course, such things only generally form a fraction of a cargo. I should include those, not on principle, but because I should think it would be a trivial matter to except.

4492. As regards shipping itself, suppose there is no such indemnity, what do you anticipate would happen? Would it be transferred to a foreign flag, or would it be laid up, because it was unprofitable to employ it, or what?—I take it there would be a great advantage given to competing foreign shipping, because the shipowner and the owner of the cargo would be free from the cost of insurance which would be necessary on the part of a belligerent. That being the case, of course, the shipowner could afford to take a much lower freight, and he would have an advantage over the British shipowner, and the tendency would be therefore to transfer British cargo to neutral bottoms.

4493. A good many witnesses have dwelt upon the great hardships, and, as they thought, great injustice, that neutrals suffered in the late war, and they almost led us to think that, after all a neutral is not much better off than a belligerent?—I think, if I may say so, the treatment accorded by the Russians to neutrals was exceptionally bad. I do not imagine it would take place with regard to any other civilised nation.

4494. Being in favour of a national guarantee for the reasons you have given us, would you say what limitation, if any, you would impose upon that guarantee?—Yes. Generally speaking, I think there should be a limitation, and that the arrangement should be limited in its scope to one which would secure adequate benefits to the nation at large. That is to say, we have not got to consider what would benefit the mercantile marine in itself in the first instance, but what would be beneficial to the nation, and on that ground I should exclude from the scope of the guarantee all British vessels engaged in trading between foreign countries, because this branch of our trade, however important to the shipping trade, does not vitally affect the nation at large. I think the national guarantee should be confined to vessels proceeding to or from ports in the United Kingdom, with their cargoes. I would further suggest that it should be in the discretion of His Majesty's Government to refuse a guarantee of indemnity in the case of any vessel adjudged by them to be unsuitable for the foreign trade in time of war by reason of age or inefficiency, but subject to the above limitations I think that the proposed guarantee should extend to all vessels proceeding to or from the United

Kingdom, or proceeding from one foreign or colonial port to another, in ballast or under charter, to load a cargo for the United Kingdom. Just to make my meaning clear, I would sum it up by saying I would distinguish between our national trade and our international trade, if I may so distinguish it; that is, that the national trade as between these islands should be guaranteed, but that the international trade should not be guaranteed, though, of course, it would continue to be protected by our Navy, as it is protected at present.

4495. Certain vessels are in the habit of making a round voyage, are they not?—Yes.

4496. The case might occur where a vessel took a cargo out from here to port A, a foreign port, there picked up another cargo, which it took to a second foreign port—B—and at B took up a homeward cargo, which it would bring back to England?—Yes.

4497. You would protect that vessel from England to the first foreign port, and from the last foreign port home to England, but you would leave the connecting link unprotected?—Yes, unless vessels were proceeding in ballast or under charter to load homeward cargo.

4498. Why should you protect the vessel if it were proceeding in ballast to load a homeward cargo, but refuse it protection if it were proceeding on the same errand to obtain a homeward cargo, but was fortunate enough to have a cargo between the two foreign ports?—Because it is making a profit independently of what I call the national trade—the home trade, a profit at the expense of the foreign country, or foreign countries between which it trades.

4499. Its chance, I suppose, of getting that foreign cargo between the two foreign ports would be less in time of war than in time of peace?—I think so.

4500. The neutral would be more inclined to find another neutral vessel if he could get it?—Yes.

4501. If the vessel that we are using as an illustration failed to get that cargo and to make a profit on that intermediate link of the round voyage, it would have to charge something extra on the homeward voyage to cover its expenses?—It might wish to charge it, naturally, yes.

4502. But you think that is not a danger against which we need provide?—I think that would be prevented by competition. May I just say that, of course, there are many vessels in addition to these you have named, vessels permanently engaged between foreign countries, that really never come to this country at all, except perhaps for repairs.

4503. Then I think you prefer a scheme of free indemnity to purchased indemnity or State insurance?—I do.

4504. Is that on the ground of the administrative difficulties of working a scheme of purchased indemnity, or is it on the ground of principle?—I object to the purchased indemnity because it is neither the one thing nor the other. It is a sort of compromise on the present system, and if the Government were to undertake to fix the premium, I do not see how they could ascertain what would be the proper premium to cover the risk, except by re-insuring with underwriters, in which case they would be involved in the same objection that the present system of insurance is involved in, that a premium would be charged in excess of the actual value of the risk.

4505. And you would prefer to treat the question as a national question, the discharge of a national duty?—Yes.

4506. And therefore to be paid for by the nation as a whole?—Exactly.

4507. I gather you do not think there would be any difficulty, where there was a national guarantee against the war risks and an ordinary private policy against marine risks, in settling, in the case of any particular loss, on which policy it fell?—That is so, because all policies of insurance are governed by the maxim of law *causa proxima non remota spectatur*. That is, the immediate cause of loss is to be looked at, and that alone, and the effect of that would be, in regard to the relation between war risks and the marine risks, that under a marine risk policy the underwriter would be liable for any aggravation of the marine risks which was caused by the existence of hostilities. Under a war risk policy, which, I take it, the Government would practically issue, the Government would be liable only for the immediate direct effect of hostile acts. That distinction is well established by the law of marine insurance. But there is one exception that I should like to make, and that is this, that, assuming there was an Admiralty control as provided by this scheme, it is quite conceivable that there would be certain risks caused by that Admiralty control which would not be covered by the ordinary policy of marine insurance. Take the case of a cargo of meat or other perishable goods. Supposing that the vessel is ordered by the Admiralty to remain in port ten days or a fortnight, the probability is that the whole of that meat would be destroyed by deterioration, and the other perishable goods, such as fruit, or fish, or whatever it may be, would be either destroyed or very greatly injured. That is not a loss that would be covered under a policy of marine insurance, and therefore I think it would be necessary that the Government indemnity should provide for a case of that kind, otherwise the person guaranteed would be a sufferer from the action of the Government, and would have no means of recovering his loss.

4508. The ordinary war policy of Lloyd's would not cover damage of that kind, would it?—No, because that is not a hostile act. Adopting the principle *causa proxima*, the immediate cause of loss is not an act of hostility, but is simply a principle of decay inherent in the thing.

4509. But you think it would be necessary in the case of a Government indemnity, coupled with the right of the Admiralty to impose restrictions on sailing, that the Government should cover loss through deterioration?—Yes; I think there should be a liability on the part of the State for loss or damage caused by Admiralty instructions and not recoverable under the terms of an ordinary policy or by any policy actually effected on the property.

4510. Do you mean that to cover damage through loss of market?—No. That is not an actual loss or damage, that is simply a depreciation. I do not think that such things as loss of interest or loss of market could be covered. They are not covered by any system of insurance so far as I know at present, because they are such vague risks that it is really impossible to define them.

4511. And you would limit it, therefore, to something that was provable and tangible, beyond deterioration of the cargo?—Yes, something that inflicted an actual damage upon the subject matter guaranteed.

4512. Do you think there is much danger of a transfer of shipping to a neutral flag in time of war?—I think there is. Perhaps not in the way of a transfer of nationality. I should think there are great difficulties in making that transfer legally in time of war, but the great danger would be that British shipping would be thrown out of employment, that foreign ships would take their places, and that at the close of the war there would be great difficulty in getting the business back again.

4513. Then as regards computation of values, we have had a great deal of conflicting evidence on that point. Will you give us your opinion?—In principle, I think the values that should be recoverable are what is covered in the law of insurance under an open or unvalued policy—that is, the value of the subject matter insured at the commencement of the risk.

4514. That would be at the commencement of the voyage?—At the commencement of the voyage, yes.

4515. Would it be possible to arrive at that after a loss, or would you have in each case to ascertain that value beforehand?—I think it would be much the more convenient course, and avoid dispute, if the Government were to issue a certificate of guarantee when they assumed responsibility for the risk, and if the value could be agreed in that certificate, as it is done now in 99 cases out of 100 in regard to a policy of marine insurance. The system of valued policy is universal in order to prevent disputes arising after loss.

4516. Of course you know better than I what a tremendous organisation is required to do that work habitually at Lloyd's and through the companies?—Yes.

4517. Could Governments step in suddenly on the outbreak of war and practically duplicate the whole of the work in respect of the war risk?—I am rather doubtful whether it would be practicable. The more practical scheme would be simply for Parliament, I suppose, to pass an Act that from the commencement of hostilities all British shipping and their cargoes,

Mr. McArthur. 16 July 1907.

within given limitatons, shall be the subject of a State guarantee, leaving it to the constituted authorities afterwards to ascertain the amount of the indemnity. I merely suggest a valuation to be agreed upon beforehand, where practicable, as the best means of avoiding disputes hereafter. I quite see that there would be a difficulty in fixing the value of the property, more particularly the value of the ship, after a loss had happened.

4518. Suppose it had not been found possible to arrange to agree values beforehand, would you yourself feel it was an impossible task, if you were asked to serve on a Committee in Liverpool, to ascertain values after the losses had been incurred?—I will not speak personally, but I will say that I do not feel any doubt that any properly-constituted Committee or Board would have no difficulty in ascertaining the real value of the ship. I have no doubt whatever that they would find no difficulty in fixing a fair reasonable value to be placed upon any ship after hearing evidence. But whether that would satisfy the person guaranteed is quite another matter. My experience rather goes to show that it would not. I mean that there are so many different opinions, and naturally the owner of the property always thinks his property of more value than an outsider. But as an average adjuster I have to constantly fix the value of ships for contribution to general average, and I get the certificate of a broker. The broker is perfectly competent to give the value of that ship. He looks her up in Lloyd's book, he looks up sales of similar vessels, and he knows within a very small amount what this ship would fetch in the market, and that I take to be the value which would be granted under a certificate of guarantee. But then you might have the shipowner saying, "My ship is a special ship," or you might have the shipowner producing another broker's certificate showing the ship was worth £2,000 more.

4519. But all that might apply under present marine policies?—Yes, but marine policies are valued.

4520. There are a few cases, such as those you just now spoke of, as open policies, I think, where there is no value put in?—They are very rare indeed. I really think we might dismiss them altogether. The value of the cargo there would be less difficulty about, because the invoices should prove its value on shipment, and the expenses of shipment could be added.

4521. You would not be afraid of having loaded invoices?—I was going to say I would suggest that there should be a provision that anything of the nature of fraud on the part of the person guaranteed should invalidate the Government guarantee. That is simply importing into this a fundamental principle of the law of insurance. I think that would be a sufficient protection.

4522. And you would allow the value of freight?—The value of freight should be the gross amount at the risk of the shipowner, less any saving in the ordinary working expenses of the voyage arising from the capture.

4523. In your *précis* you say that in the case of other interests the value should be the same as that fixed by law in the case of an open unvalued policy?—Yes.

4524. What other interests are you thinking of?—Some such interests as passage money, which is not freight; or cattle, which are not cargo.

4525. In details generally, as for instance in the case of average, you would follow the practice of ordinary marine insurance as closely as possible?—Yes, I should. I do not know whether it is the intention to cover partial losses. I have put down something on that subject which perhaps needs attention.

4526. Will you just give us your views on that subject?—In order that the indemnity should be complete it should extend to partial loss; in the case of average, whether particular average, that is, damage to the ship or cargo, general average, that is, damage incurred for the safety of the whole adventure, or salvage or other charges. In case the indemnity extends to that, the amount recoverable under the guarantee should be the same as that which would be recoverable under an open (unvalued) policy in Lloyd's form, against war risks only, plus liability for special Admiralty risks.

4527. The special Admiralty risks being those of which you told us just now?—Yes, more particularly loss or damage of perishable cargo by delay, or loss of voyage by interdiction of vessel proceeding to the port of discharge. That, of course, is rather a serious risk.

4528. Then you propose to confine the guarantee to vessels and cargoes either leaving this country or returning to this country?—Yes, or proceeding from one colonial or foreign port to another to load a cargo for this country. I cover the whole ambit of her course, as it were.

4529. It is very customary, is it not, for vessels to sail from a foreign or colonial port with instructions to call for orders here, and without the ultimate port of her destination being settled?—Yes.

4530. How would you deal with that?—In the case of ships bound to a port of call in the United Kingdom to receive orders there to proceed to a port of discharge in the United Kingdom or on the continent, as directed, and captured before arrival at the port of call, it should be incumbent upon the owner of the cargo, as a condition of recovery, to prove that the cargo was at the time of capture the property of a British subject, and that it was not destined for a foreign country. In the event of such proof not being forthcoming to the satisfaction of the Department, the owner of the cargo should have no claim for indemnity. The right of the shipowner to recover an indemnity in such case should be unaffected. In case the vessel were captured while proceeding from a port of call to a foreign port of destination, the owner of the cargo should have no right of indemnity. The right of the shipowner to recover an indemnity in such case should be unaffected.

4531. In many cases it would be impossible, would it not, for a cargo owner to prove that a vessel proceeding to a port of call had an ultimate destination in the United Kingdom. That might depend upon the state of the markets at the moment?—Yes, but what I have suggested is to prove that the cargo was at the time of capture the property of a British subject, and that it was not destined for a foreign country. I mean that in the absence of proof that it was destined for a foreign country, I should take it it was not destined for a foreign country; I would give the owner of the cargo the benefit of the doubt.

4532. Take a cargo of cotton coming to a port of call in this country. Suppose one of the continental markets was more favourable to the seller than our own at the moment, it might be sent on there?—Yes.

4533. But the owner would not have to make that decision until the vessel arrived at the port of call?—Yes, and if at the time of capture the cotton was still the property of a British subject, I do not see that you could deprive him of the benefit of the indemnity, because probably he might have decided eventually to send it abroad.

4534. Practically you would have to treat all cargoes coming to a British port of call for orders as being intended for Great Britain, up to the time they reached the port of call?—Yes, I think so, unless it could be shown that the cargo had been sold prior to arrival at the port of call.

4535. (*Sir George Murray.*) Would not you substitute "or" for "and" there—the property of a British subject or with its ulterior destination port in the United Kingdom?—I think either of those conditions should preclude the person from recovering. If the owner was not a British subject, I do not think the object of the guarantee should be to protect him. On the other hand, if he were a British subject, but intended the cargo to go to a foreign country, then there would be no object in the guarantee applying to it, because it would be no benefit to Great Britain.

4536. (*Chairman.*) Then you say that if we are to have a scheme of this kind, we must have a small expert Board of Claims, practically?—Yes.

4537. Would you be content that their decision should be final, or would you think it necessary to allow an appeal?—I think there should be an appeal. I do not think it would be satisfactory to the mercantile community if the Department might give a decision against which there was no appeal. I think the position might be looked upon to a certain extent as one-sided, because the Government would be really the underwriter, and it would be the decision of the underwriter, in which the assured had no voice.

4538. Would it be necessary to leave the dissatisfied shipowner or cargo owner his full resort to the courts?—No, I do not think that would be advisable, because we know there is so much delay connected with litigation that it would probably give rise to great delays,

and I think it would very much prejudice this guarantee if it were felt it was a matter about which there might be litigation, and there was no knowing when the shipowner or cargo owner would get his money. I think the mercantile public would much prefer referring the matter to arbitration, in case of dispute. If all parties agreed to one arbitrator, that would be the best way to deal with it; but if not, each party to appoint an arbitrator, and those two arbitrators to appoint a third, the decision of any two to be final.

4539. You attach great importance to the prompt payment of claims?—Yes, very great importance indeed.

4540. And payment in cash, I suppose?—Payment in cash. Of course, the usual term with Lloyd's policies is payment in 7 days after issuing the credit note—that is, 7 days after the time when they agree the claim is correct. I think something of the same sort should apply.

4541. As regards Admiralty control, you are in substantial agreement, I think, with the suggestions made in Scheme A?—Yes, provided that the regulations to be imposed should interfere as little as possible with the ordinary course of navigation and trading, especially as it is intended that all loss consequent upon delay, deviation, or prolongation of the voyage, should fall upon the owners of the property. Of course, the owners of large modern valuable steamers think a great deal of loss of time. Loss of time is a great deal of loss of value to them, and it would not do for the naval authorities to disregard that element in the case. I think it is quite reasonable that proper arrangements should be made for protection of the property, and the owners of the property ought to fall in with those arrangements, but I think they should be as little harassing and vexatious as possible. Then I have mentioned a point which I think is of some importance, and that is that attention ought to be given to the possible effect of these orders upon the ordinary marine insurance policy. It is possible that if a vessel were ordered to depart from her usual course, ordered to put back, or stay in port an unusual length of time, that might be held to invalidate a policy. It would have to be provided by statute, I think, that no delay in sailing, detention, or deviation from the ordinary course of the voyage, required to comply with conditions imposed by the Admiralty, should have the effect of invalidating, or should be admissible as a defence in the case of any claim under a policy of insurance on the property.

4542. How would the underwriting world like that?—I do not think the underwriting world would like this arrangement at all, if you ask my candid opinion about it.

4543. (*Sir James Mackay.*) They would put the premium up, would they not?—Yes, I think the underwriter would charge a certain additional premium, but then there is such great competition among underwriters that it would find its own level. I do not think the increase of risk would be very much, and probably the underwriter would eventually have to take it for little or nothing.

4544. (*Chairman.*) You would propose to allow the shipowner or cargo owner to insure again the same property for which he had the national indemnity?—To insure an additional amount?

4545. Yes?—I do not think you could prevent his doing that if he wished to. You would have to let him do it. Of course, he would do it at his own expense.

4546. But if you give a shipowner a guarantee, without charge, of the value of his ship, and allow him then to insure his ship elsewhere for its full value, and to obtain double the value of the ship if the ship is lost, once from the Government for nothing, and once from his insurers in respect of a premium, that is rather calculated to prevent that ship coming safely home than to get it safely home, is it not? You would at least give an inducement to a dishonest man to lose his ship?—Of course, that has been so under the existing system of marine insurance. You have to trust to the *bonâ fides* of owners. You provide, as I say, that any fraud should vitiate the guarantee.

4547. And you think that would be a sufficient protection for the State?—The only alternative would be to provide that the Government, on paying the loss, should succeed to any guarantee or any insurance the owner might have effected in respect of the same risks. That might be done; I am not prepared to express an opinion on the desirability of that.

4548. (*Sir James Mackay.*) That would have the effect of preventing them from insuring again, would it not?—Yes, it would have that effect.

Mr. C. McArthur.

16 July 1907.

4549. (*Mr. Llewellyn Smith.*) You made a suggestion for an alteration in the law about effecting ordinary marine insurance, with the object, I think, of securing that all the risks should be covered either by ordinary policy, or by the Government guarantee, that the shipowner should not encounter any risks for which he could not recover either from one or the other?—Yes; any direct risk of loss or damage, I think, should be covered.

4550. The object being that he should not fall between two stools?—Exactly.

4551. You would give an appeal from the Board of Claims, not to the courts, but to an arbitrator. That is your suggestion, I think?—Yes.

4552. Supposing that arbitrator gave his decision that the loss was not one covered by the national guarantee, I suppose then the shipowner would have to go to the underwriter with that decision and claim under his marine policy?—Of course, it would not follow because the loss was not covered by the national guarantee, that it was covered by the ordinary policy.

4553. I thought that was the object, that there should be no risk of falling to the ground between them?—We will suppose, *primâ facie*, it was a loss directly resulting from an act of hostilities. Then I think it must be recoverable under the guarantee, unless the guaranteed party has prejudiced himself in some way, as by not complying with the Admiralty regulations. In that case he would be disqualified from recovering under the guarantee. That would not give him a claim under the ordinary policy.

4554. Of course, there might be certain cases in which he might be disqualified from either, but there might be a doubtful question of fact?—The case you are supposing, I think, is a case where the loss has resulted indirectly from some hostile Act?

4555. Yes?—There is a case I might quote to exemplify that. In the American Civil War the lights were extinguished in the Hatteras Lighthouse by the Confederates, and in consequence of that a vessel went ashore and was lost. It was held that was a loss by perils of the sea, and not by a hostile act. But the law is so very clearly defined now on that point that I do not think there is much risk of a misapprehension.

4556. (*Chairman.*) One question about that. Suppose a vessel were injured by a shot from the enemy, and yet escaped, with fine weather the vessel might make its port safely, although injured; but it subsequently meets a storm, and it goes to the bottom in the storm. Is that due to the war risk or the sea risk?—That is a loss by perils of the sea. There are decided cases on that point.

4557. (*Sir James Mackay.*) The shot might have contributed, though?—Yes, but in that case what is called the doctrine of merger would apply—that is, where there is a partial loss it is swallowed up by the subsequent loss, so that the assured receives no detriment from the partial loss, and has no remedy. I have put down a case which is really a direct case on that point, the case of Livie v. Janson, which at once shows the distinction. A ship and goods were insured warranted free from American condemnation. The vessel was damaged by perils of the sea, and driven ashore in such a position as to be afterwards seized and condemned by the American Government. Lord Ellenborough held that the subsequent total loss by seizure and condemnation took away any right to recover in respect of the previous partial loss by perils of the sea. This case proceeded on the principle pointed out by Lord Campbell, that "If a total loss occurs, from which underwriters are exempt, they are not liable for previous partial loss unrepaired, which, in that event, does not prove prejudicial to the assured. The line is drawn very clearly between those two classes of loss.

4557*. (*Mr. Llewellyn Smith.*) But, still, there would be cases in which the question of fact would be in doubt, and it would go to arbitration?—Yes.

4558. The shipowner would then go to the underwriter, and say: "The arbitrator has decided that this is not a case of war risk, and so I claim insurance money from you," and perhaps the underwriter would dispute it, and then there would be an appeal to the Court, I suppose?—Yes, there would, in that case.

4559. The question is whether it is desirable, if there

Mr. C. McArthur.

16 July 1907.

is to be an appeal, to give an appeal in one case to the Arbitrator, and in the other case to the Court, because I suppose the Arbitrator's decision would not go to the Court?—I think it would be a good plan to empower the Arbitrator, on any important question of principle, to state a case for the opinion of the Courts on the application of either party. My feeling is this, that all small matters and matters of amount should be settled by arbitration to avoid delay, but I should not like to exclude any important question of principle from the Courts. I think there should be some way of appealing to them in any important matter.

4560. Supposing there was no indemnity at all, do you think the shipowners would be able to get all their war risks underwritten at some figure or other?—I think so.

4561. The insurance market would be wide enough for that; there would be people prepared to take the risks?—I think some underwriters would take any risk at a premium.

4562. And would their policies be such as the banks would recognise?—Yes, speaking generally. Of course, that is done by Lloyd's and the companies. There is a very large business done by German, French, and Belgian companies, who have a large business in this country.

4563. If we happened to be at war with any one of those——?—It would shut them out.

4564. But you do not anticipate a financial crisis in the sense that banks would not finance shipping operations because they would not recognise the policies?—No, I think not.

4565. Then your object in advocating a national indemnity is mainly to guard against sudden and violent fluctuations of rates of insurance?—Yes.

4566. You have not any doubt that there would be some rates quotable?—No. I think one incidental advantage would be to compel this country to keep up a Navy which was capable of fully discharging its obligations.

4567. You thought that the transfer of British ships to neutral flags was not very seriously to be apprehended in war time, because of the difficulty of a legal transfer, but that the business might be transferred by the laying up of British ships; but, seeing that British ships form such a large proportion of the world's mercantile marine, would not any considerable laying up of shipping cause such a rise in freights as would tempt them back again?—There would be a tendency to that, certainly.

4568. Unless there was a real transfer of shipping, could the neutral shipping continue to do their own business and do any large section of ours?—There are always a large number of ships laid up unemployed, and those would be drawn into the market.

4569. There is a large reserve?—Yes. There are a great number of ships unemployed everywhere.

4570. But a transfer of shipping to neutral flags is not one of the things that you would advocate a national indemnity in order to guard against? Some witnesses, I may tell you, have done so?—I do not think that is likely to take place during a war of short duration, and probably any great naval war now would be a war of short duration.

4571. I suppose it is at the outset of such a war that you would anticipate the most violent fluctuations?—First, at the outset, and then in the case of any captures, or striking reverse of the naval power of this country.

4572. (*Mr. Huth Jackson.*) You said that you thought the insurance world would be quite competent to look after the amount required to be insured in case of war, and you also thought that the policies of the insurance world would be taken by bankers and others as good security. Now, supposing there were some serious captures in the early part of the war, which might run into many millions sterling, do you still think the insurance policies under those circumstances would be taken by bankers, and do you still think that the insurance companies and Lloyd's would be willing to go on with the insurance?—I think the market would remain open, but there would be a great rise in insurance rates.

4573. You think that the bankers would be still willing to take the policies, but cannot you conceive a possibility of the bankers not being willing to take the policies?—They might possibly object to some policies, but they would be the exception, I think. The principal marine insurance companies have very large reserves, and there is no reason to fear their not fulfilling their obligations. There are, of course, some companies not so strong as others. I can conceive if there were any very great run of captures there might be a difficulty.

4574. That would, of course, mean stopping shipments of any kind to this country?—That would depend on the extent. I do not think it would take place to any great extent. The evil, to my eyes, is the aggravation of premium; not the sufficiency of cover, but the rise of premiums to such an extent as to unduly swell up prices and so to cause privation.

4575. You prefer the Scheme A—that is, without payment of premium, to Scheme B?—Yes.

4576. Of course, there is no idea of giving a bonus to British shipping—that is, placing it in a position better than that in which neutral shipping would be under the same circumstances?—No.

4577. I presume that neutral shipping would have to pay a war premium?—Yes, I presume so.

4578. And I take it that neutral shipping would also charge that in the freight?—Yes, I should think so.

4579. If we gave a national indemnity to our ships that would practically mean, would it not, that they would be able to do the business at a lower freight than the neutral shipping?—Against that you would have to set the aggravation of marine risks by the existence of hostilities.

4580. The marine risks would not be any greater than they were before, would they?—I think they would. I think the marine risks would be increased on account of the possibility of the Admiralty giving orders for vessels to go out of the ordinary course of navigation, or to remain longer than they otherwise would at a port of call, or to put into a port of call.

4681. But would not you cover that detention by the Admiralty in this policy?—No, I take it there is no intention of the national guarantee to cover detention.

4582. Supposing, for argument's sake, there was an area which the Admiralty thought was a dangerous one, and it would be obviously to the advantage of the Admiralty, or call it the nation, to detain ships, which would otherwise be certainly lost, and for which they would have to pay full value, for an undetermined time in a safe port, rather than allow them to be captured; do you think the Admiralty should be permitted to do that and yet not compensate the owner of the ship or cargo?—I understood that was one of the conditions.

4583. That is a suggestion; I only wanted to ask whether you agreed to it?—Yes; I do not think that loss from delay is a kind of loss that any guarantee could undertake. It is not undertaken, in fact, by underwriters.

4584. Do not the mutual insurance companies cover that?—They cover demurrage, yes, but that is a specified thing. That is a specified amount, where a ship is detained under a charter party for a certain number of days.

4585. Is not that also covered amongst one of the war risks in these mutual insurance companies?—Not as a war risk. That is what we call a Demurrage Club. There are clubs called Demurrage Clubs which cover the shipowner against demurrage—that is, in the event of his being detained for a certain number of days beyond the number of lay days allowed by the charter party, then he is entitled to recover so much per ton per day demurrage; but that is a very different thing from a vague claim for detention of a cargo, we will say, in a port of refuge for two or three weeks.

4586. If I may say so, I believe that detention is covered by the mutual insurance companies?—Possibly, but I was not aware of it, excepting in the case of demurrage.

4587. (*Chairman.*) It is covered only in regard to the ship, is it not, not in regard to the cargo?—Only the ship.

4588. (*Mr. Huth Jackson.*) I am talking now of the ship. So that that would not be an additional marine

risk?—It would not, if there are clubs which insure it, but I was not aware of their existence; and I am certain that the loss by detention of shipping is almost, if not quite, universally uninsured.

4589. What I mean is, that if you give the Scheme A the free indemnity, you may be giving an actual bonus to a British ship as compared with a neutral ship, which is certainly not the intention?—I think, on the whole, that there is so much to set against that that it would not amount to anything material.

4590. Yes?—I take it, if she were captured she would is the property of a British subject?—Certainly.

4591. Is there not a great deal of food and raw material which comes to this country unsold until it practically arrives in this country?—That would be protected against capture under the existing law. Neutral cargoes are not subject to capture under the Declaration of Paris—a neutral cargo coming to this country in a British ship.

4592. But it might be conceivable, might it not, that such articles as food and cotton might be declared contraband of war?—Yes, they might.

4593. And you might stop the stream of food or raw material coming to this country?—I think it would be protected, firstly, in this way, that I do not think any government would venture to declare food, generally speaking, as contraband of war unless it could be proved it was specially destined for the military and naval forces. Even in the late war Russia was compelled to abandon that position.

4594. At the same time it would be likely to stop the stream of food and raw material coming to this country if you limited the guarantee to only that which was the declared property of a British subject?—I do not think so, because I think, in the first place, it would be free from capture under the existing law, and if there were any attempt to violate that I think the neutral Government would look after its own interests just as we had to do in the Russo-Japanese war.

4595. You indicated that you did not think there would be much difficulty in distinguishing between war risks and marine risks. Might I, as an illustration, mention the following point:—Suppose a vessel were lost at sea?—Never heard of?

4596. Yes?—I take it, if she were captured she would be heard of.

4597. She might be sunk by the enemy's ship. I mean there are questions of that kind?—Yes.

4598. Do you not think it would be better to leave those questions to be dealt with in the ordinary channels, by appeals to the courts?—I think a case of that kind is more suited for the courts, certainly. It is a question for a jury in the case of an overdue ship to say how she is lost.

4599. (*Sir George Clarke.*) Have you formed any idea from past experience of the height to which premiums might rise in war?—I made some inquiries as to the rates on neutral property during the late war, and I found they varied from 10s. per cent. to 7 guineas per cent. Such matters are very fluctuating, and would depend, of course, to some extent, on the character of the risk. On Holt's steamers to India and China the rate was 10s., but an underwriter told me he had got from 5 to 7 guineas per cent. on neutral property.

4600. The market runs very much higher than that?—In the case of a belligerent risk it would run very much higher than that. I should think it would go to 10 per cent., or higher.

4601. You are clear that you prefer free indemnity to purchased indemnity?—Decidedly. I think, if I may say so, if it is to be done at all it must be done so as to give the utmost possible satisfaction and confidence, and not in a half-hearted or grudging spirit.

4602. Would you say that free indemnity would place property at sea in a preferential position?—To property on land, yes.

4603. If that is so, why should not the people who have been placed in a privileged position pay something for that privilege?—Only on national grounds, that it is necessary to provide some means of securing our supplies of food and raw material against serious interruption or inflation of price, and that this is the best method of doing it. Of course, as I have said, I would limit it to ships actually engaged in the home trade, the trade to and from this country.

4604. Would it not create a sense of grievance, in the minds of other people whose interests were suffering gravely in time of war, to know that particular interests did not suffer at all?—As I have tried to point out, there would be a great many risks that the shipowner would have to bear which would not be covered either by insurance or by this guarantee, such as for instance the risk of delay. That is one of the most serious risks. A voyage might be doubled in length, and that would involve the shipowner in most serious loss of interest on the ship, which he could not recover under any contract whatever. There is the doubling of the wages bill of the crew, for instance.

4605. Still, on the whole, the probability is that, under a system of free indemnity, shipowners and owners would do pretty well in time of war, when every other trade was depressed?—I do not think a shipowner would be completely indemnified. I think he would be in a much worse position than if there were no war at all.

4606. Then this system of free indemnity would put an end to all private insurance of war risks automatically?—Yes, except for an increased amount.

4607. Do you think it is desirable to abolish all private enterprise of that kind?—I think that this system is preferable.

4608. You do not think it would be much better for the State to come in only to stop premiums rising above a certain fixed amount?—No, I think not. I think that would be a very difficult thing for the State to do. It would be a very difficult thing to decide what was an adequate premium. It is neither one thing nor the other. It is an interference on the part of the State with the ordinary course of business, without the State undertaking the whole thing.

4609. Still, it would be a considerable boon, would it not, though not the whole boon, for owners to know that they would never have to pay more than a certain amount of insurance. It would be a considerable improvement on the present situation, would it not?—I do not think it is worth while to set in motion a scheme for the purpose of obtaining such results as those.

4610. But your main point was that the rise of premiums and the fluctuation of premiums was the danger?—Yes.

4611. If you could steady your premiums would it not achieve most of your object?—I should think there would be a great objection to saying that any particular premium was the maximum premium beyond which the underwriter could not go.

4612. Supposing you draw an arbitrary line, if the line is drawn too high the underwriter does the whole of your business for you. If it is drawn too low then the State will not lose so much as it would lose under the system of free indemnity?—I think it would very greatly encourage underwriters and insured to agree upon premiums, knowing they would be in excess of the premiums which they would be allowed to agree upon in ordinary business times.

4613. If the market rates ran up to the height of the State premium there would be no business at all?—Yes, but do you propose that the State should limit the amount of premium which should be paid, or that the State should pay the excess?

4614. That the State should say, We are willing to insure you at a certain maximum rate. If the market rate does not run to that, the business would be done by private enterprise?—I think it would always rise to that.

4615. But the underwriter wants to keep some business and make some profit, I suppose?—Do you propose that the State should say, We guarantee you up to 10 per cent.?

4616. No. Supposing the State says, For a voyage from London or any English port to Australia we will insure you at 2 per cent. or 2½ per cent., or something like that; if it is too high then the underwriter immediately takes the business. If it is too low, the State loses, but does not lose as much as it would lose under a system of free indemnity?—I do not think that would be a satisfactory arrangement.

4617. You do not think that the mercantile community would rather have that than nothing, which may be the alternative?—No, I do not say that, but I say I very much prefer the other method.

Mr. C. McArthur.
16 July 1907.

4618. Do you think this would be better than nothing?—I think it would be better than nothing.

4619. Why do you expect that wars are going to be short?—I think the tendency of all progress in naval science, in common with military science, is to make wars brief.

4620. We have no experience of a naval war in which we have been involved for a hundred years, and do you not think it is probable that any naval war in which we were involved might last a considerable time?—I think the ships would be brought so much more quickly together that decisive engagements would much more rapidly ensue, certainly, at the present time, than in the old time of sailing vessels.

4621. But decisive fleet engagements would not necessarily produce the end of the war?—You might conceive, of course, in certain circumstances, a war prolonging itself, but I think the tendency would be to have brief wars.

4622. Is it not rather probable that if we were at war with any naval power it would last a long time, well over a year, or something like that?—My opinion, for what it is worth, is that things would very quickly come to an issue, and one side or the other would be crushed.

4623. But the naval issue might not decide the war. It might decide the war against us, but a naval issue in which we were victorious might not decide it in our favour?—It might not decide it.

TWENTY-SECOND DAY.

Tuesday, 23rd July 1907.

PRESENT:

The Right Hon. Austen Chamberlain, M.P. (*Chairman*).

Sir James L. Mackay, G.C.M.G., K.C.I.E.
Sir George Sydenham Clarke, G.C.M.G.
Sir George H. Murray, K.C.B.
Mr. H. Llewellyn Smith, C.B.
Mr. Edward Beauchamp, M.P.
Mr. Henry Neville Gladstone.
Mr. Frederick Huth Jackson.
Mr. George H. Duckworth (*Secretary*).

Mr. James Alexander Toomey, called and examined.

Mr. J. A. Toomey.
23 July 1907.

Mr. Toomey, in a preliminary memorandum,* had submitted:—

(1) That Scheme B is preferable to Scheme A, since it is desirable that as far as possible any National Guarantee should be given on business lines.

(2) That the Guarantee should extend to all ships of British register and their cargoes.

(3) That the Guarantee should be Imperial, and that arrangements might be made with the Indian and Colonial Governments whereby they should undertake a share of such losses as might be incurred, in return for the protection given by the Imperial Navy.

(4) That even though the ordinary War Insurance market might be equal to the demands likely to be made upon it in time of war, yet that the rates asked in the event of heavy losses would probably be prohibitive.

(5) That, having regard to the immense interests involved, the State might fairly be expected to cover losses for which the premium demanded was inadequate; that the rates might be varied during the war; and that the maximum to be asked should be announced beforehand.

(6) That it is to be anticipated that the rates of premium in the open market would be an important factor in the general rise in prices during war time.

(7) That, in order to interfere as little as possible with the business of Insurance Companies, the State Guarantee should be confined to war risks only, so that the companies and underwriters should have the benefit of ordinary marine insurance.

(8) That it is desirable that a form of contract between the State and the shipowner should be signed before leaving port, but in the event of Government conditions not being complied with the holders of bills of lading for cargo should be entirely unaffected under their State policies.

4624. (*Chairman.*) You are manager of the National Bank of India, I think?—That is so.

4625. In the evidence that you give to-day you come as the representative of the Exchange Bankers' Association?—Yes, I represent the four leading banks doing business with India and the Far East.

4626. They have considered the terms of reference to this Committee?—Yes.

4627. And they have had before them the two draft schemes that we drew up as sketch plans of the kind of thing that might be possible?—Yes, Schemes A and B

4628. Will you give us your views generally?—The Exchange Banks are not in favour of Scheme A, whereby a national guarantee would be provided gratuitously, being of opinion that, as far as possible, any such guarantee should be given on business lines.

4629. Are they in favour of Scheme B?—They are in favour of Scheme B, whereby State insurance of war risks would be provided on payment of a premium by the shipowner or shipper of goods, and they consider that the scheme should be extended to all ships of British register and their cargoes.

4630. And as regards Indian and Colonial shipping?—They consider that as the Indian and Colonial Governments have no naval forces to protect their commerce the whole matter should be left to the Imperial Government to undertake. But we think an arrangement might be made with the Indian and Colonial Governments by which they should both share such losses as might be incurred, in return for the protection given by the Imperial Navy to their commerce.

4631. In advocating a scheme of insurance on those lines, what are the objects which you have chiefly in view?—We do not say that the war insurance market would not be equal to the demands likely to be made upon it in the event of England being involved in a war against another European Power or combination of Powers, but insurance companies, being commercial undertakings, would be compelled to charge rates of premium calculated to give a reasonable margin of

* *Vide* note, p. iii.

profit, and these rates might, in the event of heavy losses, be made prohibitive. Such considerations would not apply to State insurance, the object of the State being to provide insurance at non-prohibitive rates, and to facilitate trade by all means in its power.

4632. Are you afraid of the loss of our shipping, or is your object mainly to secure the free course of our commerce?—Mainly to secure the free course of our commerce.

4633. You are afraid that rates would rise to such a point that ordinary commercial operations could not be carried on?—Well, they would be carried on with considerable difficulty. Merchants would not know exactly where they were with regard to insurance rates.

4634. But the outbreak of war would be followed by great uncertainty in the commercial world on all hands, would it not?—Yes. It would disturb trade in all its branches very largely.

4635. And all the financial operations of trade, the credit on which trade depends?—Yes; it would tighten money, for instance, and make bankers cautious, and there would be considerable difficulty. Trade would not be carried on with the ease it is carried on at present.

4636. Having regard to all those circumstances, do you think that even high insurance rates would be a very important factor in the general raising of prices?—I am quite sure it would.

4637. Will not the other factors be really of much greater effect? If you can suppose for a moment that there was no rise in war premiums, or no war premiums were necessary, there would still be a great rise in prices, would there not?—Undoubtedly. Freights would be higher for one thing. All charges would be higher.

4638. And the very restrictions of credit and the restrictions of banking operations, of which you have spoken, will tend to raise prices?—Quite so.

4639. And to create a degree of uncertainty in the minds of commercial men as to the operations to be carried on?—No doubt.

4640. When you have made proper allowance for those disturbing factors, do you still think that the marine insurance rates would count for very much in the total?—Yes; I think there would be a large amount of uncertainty with regard to insurance rates. I think it would be highly desirable to have a State guarantee covering war risks. It would be advisable to make the scheme self-supporting, but that would be practically impossible to do. But we say that the loss should be minimised as far as possible, and that the rates of premium charged should be fixed on the low side rather than on the high side.

4641. Of course, in so far as the scheme were not self-supporting it would come under the condemnation you pass on Scheme A, of being not on business lines?—Yes, but you see it would be highly desirable to carry on this Scheme, say Scheme B, even at some loss to the State, because, although shipping would benefit the nation would benefit, on the other hand, by trade being greatly facilitated.

4642. It would not be quite true, would it, to say there would be no restriction, because no scheme of indemnity would insure the arrival of the cargoes?—Quite so. At all events, it would facilitate commerce to a very large extent by having this Scheme B.

4643. It would encourage ships to sail, but it would not ensure their arrival?—Quite so.

4644. It might even tempt them into some recklessness?—The State guarantee?

4645. Yes?—I do not see where it would.

4646. If they were guaranteed against loss whatever happened, a shipowner might take fewer precautions?—Yes; but I think the Government should draw up a set of rules for shipowners to follow. In any case the holders of bills of lading should not be affected in any way by any breach of conditions on the part of shipowners.

4647. You feel it necessary that the guarantee to the holders of bills of lading should be absolute?—Absolute.

4648. But the guarantee to the shipowner you would make dependent on his carrying out the Admiralty conditions?—Quite so.

4649. Those conditions, I presume, would have to be general. They could not be issued to each ship individually?—No, they would be general conditions for all shipowners to subscribe to.

4650. They might at a given time involve the closing of a particular route altogether?—Yes, according to circumstances.

4651. Conceivably, under certain circumstances, the Mediterranean might be declared unsafe by the Admiralty?—Quite, and then they would have to sail round the Cape. At all events the shipowners would have to carry out the Admiralty conditions.

4652. And you would be prepared for the Admiralty conditions taking that character if need be?—Of course we should have to abide by those conditions.

4653. Do you consider that it would be necessary for the shipper of cargo to have a document from the State to show that he was guaranteed?—Yes, he should have a sort of State policy covering his war risks, which could be handed to banks on negotiation of bills of exchange.

4654. And therefore each separate venture would have to be represented, as it is in ordinary times, by separate policies?—Quite so, or by an open policy, as the case may be.

4655. Have you considered how the State could organise an office capable of discharging those duties on the outbreak of war?—No, I have not; but, of course, it would be necessary to get the machinery all ready to start in the event of a war breaking out.

4656. The State clearly could not maintain an office staff to do that work in time of peace, when the work would only arise on the rare occasions of a great war?—That is so. You would not have a permanent department.

4657. The amount of work to be done would be equal to the ordinary peace work of Lloyd's, and all the insurance companies put together, would it not?—No doubt there would be a very great rush of business.

4658. Do you think, I will not say any Government Department, but any Government or private individuals, could organise a business of that kind suddenly?—I think if the Government are going to take up this Scheme B seriously they should make all their arrangements for it to be put in force at a given time.

4659. They would have to have, I suppose, an office at each of the principal ports, at any rate?—They could appoint agents at different ports.

4660. Do you think they might use the insurance companies or brokers as their agents?—Yes, that would be advisable.

4661. How do you suggest that they should fix the rates? Should they draw up rates in peace time, before war has broken out, and before they know the exact circumstances, or must they wait until a particular war has begun?—I think the Government should take expert opinion with regard to the rates of insurance in time of war, and then when war broke out the Government should be prepared to quote certain rates. If they were not sufficient, they could be raised, and so on, but the Exchange Banks think it would be desirable for the Government to fix a maximum rate, beyond which the Government would not go under any circumstances during the continuance of hostilities. That would give great confidence to the mercantile community. Merchants would say, Under any circumstances the rates will not go beyond a certain point, and they would be able to make their calculations accordingly.

4662. I understand you would allow private individuals to conduct the same business in competition with the State?—Yes, there is no reason why they should not. You would not make the State insurance compulsory, but I think the State should be able to do it at lower rates than ordinary insurance companies, because there would be no margin of profit to provide for.

4663. Of course, if the State is to try to adjust its rates to the risk, even within the limits which you have laid down, it must have regard to the particular circumstances of the particular war, and of the particular time?—Quite so. You would have to charge a higher rate of premium if England were involved in a war against several Powers; it would be higher than in the event of a war against one European Power.

4664. It would be impossible to fix rates on that

Mr. J. A. Toomey.

23 July 1907.

basis until the war actually broke out?—Until you saw what kind of a war it was going to be.

4665. And after it had broken out, if the Government found that they had miscalculated, that their expert advice was wrong, and that their rates were very markedly below the risk, would you raise them?—We say that the rates of premium should be varied from time to time according to the circumstances.

4666. In such a case as that would you allow them to raise the maximum?—No; once the maximum was fixed I would not alter it under any circumstances.

4667. What is your idea of the maximum? It is, I suppose, some rate which would not be prohibitive of commerce?—Quite so.

4668. Have you formed any idea of what that would be?—No, I have not. I am not an expert in insurance matters.

4669. It is rather a commercial matter than an insurance matter, is it not?—I would gain the opinion of insurance experts on that point as to what the maximum should be. If that maximum could be fixed, I think it would give great confidence to the commerical community at large.

4670. I suppose really the maximum charge that could be borne by trade would vary in different branches of trade?—Undoubtedly. There are a large number of articles, which could not be brought into play at all by a very heavy charge.

4671. Would you contemplate making a different maximum for different classes of cargo? To take two extreme instances, would you contemplate a higher maximum for, let me say diamonds, than you would for wheat?—No, I do not think I would differentiate.

4672. On the ground that it is not worth while; it makes it too complicated?—It makes it too complicated. The Government should be prepared to carry on such a business at a certain loss to the State, considering the advantages the State Guarantee would have for the large interests involved.

4673. That loss would fall upon the State, of course, at a moment when its expenditure was very high indeed?—Quite so.

4674. Would you recommend the Chancellor of the Exchequer to undertake that additional expenditure at such a time, without having made special provision for it beforehand?—Yes, I would. The war would be unforeseen to a certain extent. I would allow things to adjust themselves afterwards, or the Chancellor of the Exchequer could do the best he could later on.

4675. He would be increasing the burden of debt or the burden of taxation?—For the benefit of the community at large.

4676. But the community would be very unequally interested in the results of the guarantee, would it not?—Yes. It would be primarily for the benefit of the shipping community.

4677. And what do you say with regard to the other portions of the community, bankers for instance?—We say that the loss to the State should be minimised as far as possible, and if possible this business should be carried on without loss to the State, if it could be so worked.

4678. Subject always to the fact that if the actual losses are very large the State must be prepared to accept a premium that will be insufficient to cover them?—If necessary.

4679. That probably means that some loss, and possibly a considerable loss, might fall upon the State? We will say that some loss will very probably fall upon the State.

4680. I suggest a considerable loss, because the moment the State quoted much above the risks, the business would all go to the ordinary underwriter His rates would be lower than the State rates?—Yes. I should interfere as little as possible with the ordinary insurance business.

4681. So that they would get the pick of the business?—I think if the State charged very high premiums the whole of the business would go to the insurance companies. In that case there would be no loss to the State at all.

4682. Then there would be no advantage in the scheme?—I think it would be very desirable to have a State guarantee, because without it we might have very high rates of premium.

4683. Would you say, as the result of your experience of what you have seen of other countries at war, that underwriters have, as a matter of fact, charged on an average premiums more than sufficient to cover their losses?—That I could not say. I have no experience of what they have been in the habit of charging.

4684. It is a general impression, is it not, that they have not made a very good thing out of recent wars?—I think the insurance companies are very reasonable, but they have to protect themselves, and they have to quote rates giving a margin of profit. They cannot tell exactly what the margin of profit may be.

4685. You would hope that by a State guarantee commerce would gain something more than relief from the margin, which is profit?—Yes; I think it would add so much to the confidence of the mercantile community. It would facilitate trade to a very large extent to have this guarantee.

4686. And you do not think there would be any general disinclination on the part of other interests to contribute to this indemnity to shipping and cargo?—No, I think not, the general idea being that the loss to the State would be minimised as far as possible. I do not think there would be any outcry on the part of the general community.

4687. Other interests would be suffering very severely. I think it was a banker who suggested to us the other day that, for instance, his Consols might be very much depreciated by the outbreak of war?—That would mean tight money would drive the price of Consols down.

4688. Yes, and that he would not like to have an extra tax levied on him to recoup the shipowner, who was probably, in spite of everything, making a very handsome profit, just at the moment when he, the banker, was having a very anxious time, and suffering great loss for which he got no indemnity?—He would be probably looking to a higher rate of interest to help him.

4689. You think he would get home, too?—No doubt. He would not carry on his business at a loss.

4690. (*Mr. Llewellyn Smith.*) Do you contemplate that within the maximum fixed the State should do insurance business at lower rates if it found it profitable?—I think the State should do the business as cheaply as possible, and, if possible, with no loss to the State.

4691. Your first point, I think, was the advisability of fixing an absolute maximum, so as to give confidence?—Quite.

4692. As regards that maximum, you have not thought of the actual figure; but let us say, for the sake of argument, that it was 5 per cent; then insurance rates would never rise above 5 per cent.?—They should not.

4693. That being so, supposing 5 per cent. was fixed, could not all the risks lower than 5 per cent. be left to the ordinary underwriters?—Quite. You would not make State insurance compulsory.

4694. What would be the advantage of the State doing any business below the 5 per cent., assuming 5 was a good figure?—The idea is that the insurance companies would be inclined to charge excessive rates.

4695. But not above 5 per cent., you see, because it is limited to that?—Yes, the State would be limited to that 5 per cent. That would take the place of ordinary war risks. I say that the State would be able to work cheaper than the Insurance Companies.

4696. So that you would advocate them competing with the Insurance Companies even within that maximum?—I would not say competing with the Insurance Companies, but if the Insurance Companies like to work cheaper than the Government I should say let them do it.

4697. It has been suggested to us that it would be sufficient if the State fixed a maximum and was willing to take risks at that figure; that that would keep down insurance risks to that figure, and below that it might leave it to private enterprise?—I see no objection to that.

4698. The ground on which you would like to fix a maximum would be, in general terms, to give confidence to the commercial community. Do you anticipate that if there was no indemnity and no guarantee the ordinary insurance market would not be wide

enough to take the risks?—No, I do not say that. Of course, there would be a tremendous amount of business offered to the insurance companies, and they would have to quote rates of premium calculated to give them a margin of profit, and in the event of heavy losses they might charge rates which might prove to be prohibitive.

4699. But you do not anticipate in addition to that that the market might break down and be unable to afford insurance at any rates?—I could not go the length of saying that, because without a Government guarantee we would have to get on as best we could with the existing machinery.

4700. Or that bankers would be unwilling to recognise insurance policies as good security?—They would go on taking the insurance policies of good insurance companies up to a certain point.

4701. I did not know whether that was one of the things which you included when you spoke of commercial confidence?—I was speaking of commercial confidence as a whole, anyhow a State policy and a State guarantee would give great confidence and stability to the commercial community.

4702. (*Mr. Huth Jackson.*) You said that you represented the four Indian Banks; would you mind mentioning them?—The Hong Kong and Shanghai Bank, the Chartered Bank of India, Australia, and China, the National Bank of India, and the Mercantile Bank of India.

4703. I suppose it may be assumed that those four banks conduct the greater portion of the financial operations between India and the East and Great Britain?—Yes, they do the largest share of Indian and Far Eastern business.

4704. Can you give me any idea as to how much of the whole business is still financed through London?—You are taking the outward trade?

4705. The homeward trade from the East?—There is a very large proportion done by bills of exchange on London.

4706. Would you still say the largest proportion?—Yes, the largest proportion.

4707. I suppose a great portion of that is on account of Continental business?—A fair amount of that business represents Continental business.

4708. Of course, in time of war, provided those goods were neutral, Continental shipments would not be liable to the same risks as the goods that were coming to British ports?—Most of the goods would be in British bottoms.

4709. Is the greater portion of the trade in British bottoms?—I should say so.

4710. In time of war, I suppose I may take it that all the banks would require to be covered—that all bills of exchange and all documentary bills should have the war risk covered?—Yes, we should insist on that.

4711. That would be absolutely necessary?—A *sine qud non.*

4712. You do not see any reason for hesitation on the part of the bankers to accept ordinary insurance policies against war risks in time of war?—Without a national guarantee we should have to go on taking those policies, which we would do, so long as we were satisfied.

4713. Yes, but I suppose you can conceive a possibility, if there were some very heavy losses, that the banks at any rate might show a certain hesitation in taking these policies?—Yes, it is conceivable.

4714. And then I suppose the banks would not negotiate the bills at all?—The merchants would then have to give us other policies. There might be great difficulty in negotiating the bills of exchange.

4715. I suppose the banks would practically decline to take the bills at all?—It would be necessary to satisfy the banks. If the banks were not satisfied, they would not negotiate the bills.

4716. Then you would apply such a national guarantee to all cargoes in British ships?—Yes, everything.

4717. Whether with British-owned cargo or foreign-owned cargo?—Everything that was financed, say from the Far East or India, or outward from home in British bottoms. I should not be inclined to make any exceptions.

4718. You talk about an adequate premium. You conceive the idea that the State should in principle charge a premium which would pay its losses?—Which would cover any losses. We say that the loss to the State should be minimised as far as possible. It would be a good thing if the State could charge rates of premium just calculated to cover any losses, but you could not very well do that, and therefore we should say: Fix your rate of premium rather on the low side than the high side.

4719. And for the State to run the risk of that not being sufficient to cover the losses?—Yes; the business should be carried on at some loss if necessary, owing to the great advantage which this insurance scheme would give to the trading community in general.

4720. You do not contemplate that the State should ever refuse to accept a risk?—No, they should take risks without exception. There should be no limit.

4721. Subject, of course, to the Admiralty's prohibition of certain routes?—Yes, subject to Government conditions being complied with.

4722. Then do you contemplate that the State should issue a separate policy on each occasion to cover that risk?—Yes. We should want some document to show that the goods were insured against war risks.

4723. It would be rather difficult, would it not, in India and Australia, to provide you with a document?—I suppose the State would have agents empowered to give these war risks.

4724. So that if there is to be not only the machinery here in England, but also machinery in all the shipping ports in the East, it means a very extensive and expensive and complicated system of machinery, does it not?—I think the Government could work through agents. I dare say they could do it economically by way of commission.

4725. Still, it would be expensive and complicated, would it not?—I think things would settle down and work smoothly after a very short time. You could get experienced men to act on behalf of the Government.

4726. (*Mr. Beauchamp.*) Your chief reason for preferring Scheme B to Scheme A is that it is on business lines; is not that so?—Quite so.

4727. But it is to be more or less self-supporting?—We should say that the loss to the State should be minimised as far as possible.

4728. But still you would have a maximum premium beyond which the insurance rate should not go?—Yes.

4729. And that premium might be much less than would be necessary to cover the State against loss?—Yes. It might be found to be below the actual cost to the State. That would mean that the State had miscalculated the risk.

4730. If not, the only difference between the State insurance and the ordinary insurance would be the margin of profit exacted by the underwriter?—Yes; that is how it should be.

4731. And if the premium is not sufficient to guarantee the State against loss, then it would cease to be on business lines, I suppose?—No, it would be on business lines to a certain point; but the maximum that had been fixed would show that the State or its advisers had miscalculated that risk.

4732. It would fix the maximum premium at the outbreak of the war?—Yes, it would be highly desirable to do so, so as to give confidence to the trading community.

4733. Then the premium, when the loss exceeded that, would cease to be really on business lines; that is, when the number of losses exceeded the rate of premium, then it would cease to be conducted on business lines?—I rather put it that in that case the Government would have miscalculated the real risk, and that the maximum had not been fixed high enough.

4734. But the maximum is fixed so as to allow the trade to go on. That is the reason of the maximum being fixed, that the premium should not be such as to prevent the ordinary trade of the country being carried on?—We say that as far as possible this scheme should be carried out on business lines, and that the maximum rate should be fixed as a maximum likely to cover all reasonable risk. If it was found that this maximum did not cover the risk the loss would fall on the State, but it would be a matter rather of miscalculation.

Mr. J. A. Tcomcy.

23 July 1907.

4735. If the calculation had been properly made, the only difference between the premium exacted by the State and the premium exacted by the ordinary underwriter would be the profit which the underwriters ought to get?—Quite so.

4736. It would be not a very considerable amount?—That is so.

4737. The difference on each premium would be very small, would it not, to allow for the underwritters' profit?—Yes, I suppose so.

4738. And therefore what great advantage would there be in having this national guarantee, instead of leaving it to the ordinary underwriter?—It is conceivable that without a State guarantee there might be very considerable difficulty in getting insurance in all cases against war risks. I do not think it is probable, but it is conceivable in the event of a very big European war.

4739. For what reason do you say that?—That the business might be so gigantic.

4740. The losses so great?—The war risks to be taken might be so very great.

4741. In individual amounts, do you mean?—The general trade altogether—the aggregate.

4742. Would it be greater than it is at the present moment?—You would have this war risk in addition to all the ordinary insurance. It would all be additional business to the insurance companies.

4743. Do you think that the ordinary insurance market would not be able to cope with that?—I do not say they would not be able to cope with it, but it is conceivable that there might be considerable difficulty in getting all the war risks you wanted covered. We say that if this guarantee is given it should be for war risks only, so that the business of the insurance companies should be interfered with as little as possible; that they should be allowed to carry on their ordinary insurance business.

4744. Scheme B would necessitate, of course, a central office?—Yes, that is so.

4745. And you think this national guarantee should be carried on all over the world, through agents—in Australia, we will say, and India, and so on?—Yes. I think there would be no difficulty in getting agents all over the world to act for the Government. I think those appointments would be sought after.

4746. The premium would have to be fixed at the central office, and the different agents would have to be advised?—Yes.

4747. And you do not see any difficulty on that ground?—No. I think the business would work smoothly after a very short time.

4748. In a very short time after the outbreak of war, but it would be in the early stages of the war when we should require this more than at any other time?—Business people soon settle down to the conditions to be complied with.

4749. Do you think it would be possible, directly after the outbreak of war, to get anybody to undertake to supervise this from amongst the experienced underwriters?—I think the Government should have all the materials cut and dried before the outbreak of war, and have agents appointed.

4750. Yes; but they would have to have somebody who would be able to estimate the different risks, if the premiums were to vary, and that would necessitate having somebody at the head of the office with great experience in insurance?—Yes, in London.

4751. Yes. Do you think, after the outbreak of war, you would be able to lay your hand upon and get that person, and take him away from his ordinary business?—I should say, if the Government does that on scheme B or any other scheme, they would make arrangements to have all machinery put in order before the outbreak of war, and they would appoint their agents to act for them all over the world. They would appoint Government agents before the actual outbreak of war.

4752. But would it not be directed from the central office in London?—Yes, the central office would be supreme.

4753. Would you contemplate having a permanent official in peace time at the head of the central office?—I should say that, if any scheme is adopted by the Government, a Government officer should be appointed to take charge of that class of business, and make arrangements to perfect the scheme.

4754. And then you would be obliged to find an experienced person?—Yes, and he would have to get expert advice.

4755. And in order to get a good man you would have to give him a good salary?—Certainly.

4756. He would have that salary during all the years of peace, and he would be carrying on practically no work until the war broke out?—Yes; but a few thousand pounds a year would not make much difference to a Government when there were millions and millions involved.

4757. Supposing we did not have scheme B, but scheme A, where the Government covered everything free of cost, would a notice to that effect be sufficient for the bankers, without having a separate document for each individual shipment?—Certainly, it would be sufficient, if it was clearly defined. If public notice was given that the Government covered all risks free of cost, we should then be satisfied with our ordinary insurance policy; we should not require any policy covering war risks.

4758. (*Sir James Mackay.*) That would be that, provided the master carried out the orders of the Admiralty, the ship would be covered?—Yes; but we say that innocent holders of bills of lading should not be affected in any way by any breach of conditions on the part of a shipowner or a master.

4759. I suppose your idea of a national guarantee is to permit of business being carried on in time of war as in time of peace?—With as little disturbance as possible.

4760. So that vessels might go on during war as they do during peace?—Quite so.

4761. But you would contemplate, of course, that to get the benefit of a national indemnity they would have to carry out the orders of the Admiralty?—Quite, so far as the shipowner was concerned, and if he committed any breach of conditions it would be his own look-out. He might be made to suffer for it, but the holders of bills of lading should not suffer.

4762. Then I suppose the Admiralty would be rather chary about allowing vessels to proceed, say, from Port Said, through the Mediterranean, if they were not pretty certain of getting through?—That would be dependent on the strength of the enemy.

4763. But the Admiralty would not be likely to allow a ship to leave Port Said for England if the Mediterranean was held by the enemy?—No, I suppose not.

4764. They would tell him to lie up at Port Said?—Or proceed round the Cape.

4765. To go back through the Canal, and go round the Cape?—Yes.

4766. That would not be allowing commerce to be carried on during war as during peace?—Of course, you would have to take all the circumstances into account. The Government would not be able to let vessels go through the Mediterranean if it was held so strongly by the enemy.

4767. Then what is the good of the indemnity? If you are only to be allowed to proceed when there is not much risk, is the indemnity very much good? Does it allow commerce to go on during war as during peace?—We say that the Government should allow trade to go on with as little disturbance as possible.

4768. Is not that only possible by having a Navy that is capable of keeping the seas clear?—I do not think the English Government could tie up steamers at Port Said and prevent steamers coming through the Mediterranean.

4769. Not if the Mediterranean was held by an enemy, and the Government were to be responsible if they allowed the ship through?—The English Government would have to accept some loss. There would be some risk in carrying on trade, naturally, during war time.

4770. It would be no use to let ships leave Port Said if they were likely to be eaten up by the enemy. It would be no advantage to British trade?—You are assuming great strength on the part of the enemy.

4771. I am assuming the Mediterranean is held by the enemy?—Then the only thing to do would be to send the ships round by the Cape.

Mr. J. A. Toomey.
23 July 1907.

4772. Then I suppose they would have to take orders at the Cape again, would they not?—I suppose they would.

4773. As to whether it would be safe to come up the coast of Africa and through the Bay of Biscay?—I do not think people would wait for absolute safety.

4774. (*Sir George Clarke.*) You are convinced that it is necessary for the State to do something?—I think it would be highly desirable for the State to adopt this scheme. I cannot say that it is absolutely necessary, but I think it is a good scheme.

4775. But not an essential scheme?—I should not look upon it as an absolute necessity.

4776. Your view is that the steadying of the rates in time of war is the important question?—That is not the most important question. It would give great confidence and stability to the commercial community if there were this scheme.

4777. Would it satisfy you if a schedule of rates were fixed now for particular zones of the world, and it were known that from the moment war broke out, or even before war broke out, the State was ready to insure at those rates? Would that satisfy you?—Certainly.

4778. If a schedule were issued to-morrow, with certain fixed rates for war, would that meet your requirements?—Yes, we should be satisfied with that, so far as we were concerned; but the principal people would be the shipping people, and it would be a question of satisfying them.

4779. Of course, if that were done, there would be no necessity for any great office at all; it would be merely a fixed schedule with conditions laid down by the Admiralty attached, and policies with the necessary authority could be given by any insurance companies acting as agents?—Yes.

4780. That would simplify the whole situation?—Yes.

4781. And if the rates were drawn too high, the market would come in and take them, I suppose?—Or the Government could reduce their rates.

4782. But, anyhow, if the rates went above the market for the time, the insurance companies could come in?—The insurance companies could come in.

4783. On the other hand, if the rates were fixed below, the State would stand to lose something?—You are now taking the maximum. The rates could be varied from time to time within the maximum.

4784. But the great point would be that the maximum rates should be known to everybody in advance?—Certainly.

4785. I think you disagree with the view that the general financial disturbance which might happen in the event of a great war would be so great that these questions of insurance are quite a bagatelle in comparison?—I do not quite follow.

4786. It has been suggested to us that there would be such a tremendous financial disturbance in this country generally on the outbreak of a great war that such a question as the insurance of ships is a small one in comparison. Do you agree with that?—No, I think the insurance would be a big item.

4787. You think that in any case during a war the rise of insurance rates would have a very important bearing?—It would be a very considerable factor.

Admiral Sir Cyprian Bridge, G.C.B., called and examined.

Admiral Sir C. Bridge G.C.B.

Sir Cyprian Bridge, in a preliminary memorandum,* had submitted:—

(1) That the time during which our shipping will be exposed to risks directly or indirectly connected with a state of belligerency must be divided into:—

(*a*) The period of tension immediately preceding, and succeeding an outbreak of war.

(*b*) A further period starting on the close of the first, and lasting practically throughout the war.

(2) That a serious check to commerce before or after the outbreak of war may have irreparable consequences; and that the adoption of the arrangement known as National Guarantee may encourage our merchant ships to continue running.

(3) That consideration should be given to the inclusion of neutral-owned cargoes in British bottoms under a National Guarantee.

(4) That it is probable that during the second period mentioned above, no plan of protecting our ocean commerce would be worth its cost, except that of active Naval defence.

(5) That it is essential that provision should be made for the safe arrival of vessels carrying cargoes of food and raw materials, and for the safe conduct of those carrying our products to friendly countries.

(6) That no form of Government indemnity could have insured the arrival of merchant vessels at Port Arthur or Vladivostock, though at the same time ships arrived with but little interruption at Japanese ports, without any hope of indemnity or guarantee.

(7) That it would be fair for the State to exact some payment in return for an indemnity, and that each portion of the Empire should be responsible for the cost of indemnifying its own shipping and cargoes.

4788. (*Chairman.*) You have seen the reference to our Committee?—Yes.

4789. You gave evidence before Lord Balfour of Burleigh's Commission on Food Supply?—Yes.

4790. May I take it that substantially you have seen no reason to change the views that you expressed to that Commission?—Yes, I think so. There is one thing I should like to say, which did not happen to come within the scope of my examination before that Committee. I have endeavoured, in the précis of evidence which I propose to submit here, to direct attention to what I call the period of uncertainty. I do not think I was in any way given an opportunity of dealing with that in my evidence before the Commission.

4791. Will you give us your views on that?—The time during which our shipping will be exposed to risks directly or indirectly connected with a state of belligerency must be divided into at least two periods. The first will begin when the strain upon our relations with the future actual enemy or enemies has reached the point at which the outbreak of war may be regarded as nearly certain, and will end at the date—perhaps some four or five weeks later than the formal commencement of hostilities—on which the conditions dictating the necessary arrangements for the defence of our maritime commerce can be ascertained. The second period will start on the close of the first, and will last practically throughout the war. The first period will be one of uncertainty. I should like to interpolate here that this statement is made with full recollection of all the facilities of communication by telegraph, and all that sort of thing. The period of uncertainty will still exist, although it may be much reduced from what it would have been before there were steamers and telegraphs. It will not be known exactly when war will break out, and after the outbreak some time will be required to discover what the enemy's method of commerce-destroying is going to be. It is in this period that the rate of marine insurance, as we learn from experience, is pretty sure to rise, and it may rise to a figure high enough to cause a great increase in the cost of imported commodities, not to mention the effect on the exchange value of commodities for exportation. The more distant the port of departure from the destination of British ships the greater will be the risk to which they will be exposed. The case of steamers coming round the Horn, for instance, from New Zealand is a good illustration of the length of time as compared with a steamer coming from the Norwegian ports, for instance.

4792. Take the first case—of the steamer starting from New Zealand. A great part of its course might

* *Vide* note, p. iii.

Admiral Sir C. Bridge, G.C.B.

23 July 1907.

be quite outside the danger zone, might it not?—Yes, it might be. Of course, we have not gone into the case, yet at all events—I do make some allusion to it hereafter—of what preliminary distribution of intended commerce-destroying force the enemy may make. It is conceivable that they might have vessels ostensibly on a peaceful mission at Tahiti, or somewhere there.

4793. But it would not necessarily follow, would it, that the risk was proportionate to the length of the voyage?—No. You would have to take into consideration the area as regards the probability of assaults on our commerce within that area. All these matters, I may mention, are things which involve great variety of conditions. No satisfactory prognostication can be made unless every different condition is taken into consideration.

4794. And the results must vary with each different Power or combination of Powers with which we may be at war?—I think so.

4795. And with the view which is taken by that Power or Powers as to the best course to pursue?—Yes. The point I want to make in dealing with that period of uncertainty is this, that previous to the actual commencement of the war naval defence of commerce cannot operate, at any rate directly. "Shadowing" the future enemy's men-of-war before hostilities begin will do something, but probably not enough to keep down the rate of insurance. As soon as war has broken out direct naval defence becomes permissible, but it is likely to operate with imperfect effect until the enemy has been obliged to show his hand. We may, therefore, consider the whole of the so-called first period, or period of uncertainty, as virtually a time during which defence of maritime commerce by even the most efficient fleet cannot be expected to make itself much felt. Probably this is the primary cause of the rise in insurance rates, though those rates rise still higher in consequence of the action of speculation based on the apprehensions of shipowners and cargo shippers. A serious check to the activity of our merchant shipping immediately before and after the outbreak of a war may have irreparable consequences. Though I am convinced that the only way to ward off violent onslaughts on merchant shipping is to use at least equal violence against its assailants, I can see that, in the period of uncertainty when the onslaughts and the acts of repelling them are only likely, some administrative measure may be indispensable. The object will be to encourage our merchant ships to continue running, and especially to get the food and raw material which we cannot do without safe into our ports. Adoption of the arrangement known as the national guarantee may be the right measure. It is, as regards the period of uncertainty, a matter on which, in my belief, the opinion of a naval officer, as such, is of little importance. I am glad, sir, that you gave me an opportunity of explaining that at length, because it did not come within the scope of my examination before Lord Balfour's Commission.

4796. I would like to ask you a question in reference to that before we go further. What are the kind of evil consequences that you spoke of just now? Is it the interruption of our food supplies, or is it the permanent destruction of our mercantile marine?—I meant more immediately the introduction of a general apprehension as to the possibility of our mercantile marine continuing to run successfully during the war. There would be quite likely within that period a shock given to the confidence of everybody who was concerned in shipping in the power of that shipping to continue running, which, if it went very far, would be extremely disastrous. It would knock our shipping out altogether, so to speak.

4797. You would anticipate, I gather, that the time during which we should be exposed to that shock, assuming that our naval defences were in proper condition, would be a limited one?—Yes, it would be a limited one; but the period of uncertainty before the war may last for some month or two, or, at all events, a time which is relatively large when you take into consideration the length of steamers' voyages.

4798. The fear of being caught at sea, and in a dangerous place, at the outbreak of war?—Yes, that is it—when the outbreak comes, the immediate date of which nobody can tell.

4799. The first result of that fear would be to raise freights, would it not?—I should think very much.

4800. And to raise the price of imported commodities?—Through the action of the insurance.

4801. But not alone through that, would it? The insurance would add an additional factor, but the uncertainty of arrival would cause the price of the produce to rise?—That is the point upon which I really hardly venture to have an opinion, but it does seem to me that the actual price of the commodity would not be much affected by that—that there would be the natural desire of the shipowner to secure himself against eventual loss by charging a higher rate than usual, and the rise in insurance. I do not know that my opinion is worth much on that point, but that is what seems to me, as a pure outsider.

4802. After all, the determining factor in the price of the commodity must be the supply which comes to hand?—Yes.

4803. If there were any shortage in the supply landed in this country prices would go up?—Yes; but I am assuming that there will be a probable rise of freights, and an almost certain rise of insurance during that time when there may be no actual attack on the commerce at all, viz., the period of uncertainty; so that the quantity of commodities coming into the market—take the market of the United Kingdom, for instance—will not be affected. It is more a mental than an actual thing—the apprehensions of the shipowner as to the safety of his ship, and of the people who insure as to what they will have to pay in case of loss, will make a double rise, and that may affect the price of commodities.

4804. You are now speaking of the period before the outbreak of war?—Yes.

4805. Then, taking the period immediately following the outbreak of war, which is also included in your period of uncertainty before the enemy has shown his hand, there, in addition to the factors which prevailed before the outbreak of war, there would be the additional factor of the amount of seizures effected by the enemy?—Quite so. I lump those two sub-periods, so to speak, into one, as the period of uncertainty, for this reason—that it is during that time that naval defence either cannot operate at all, or can only operate very imperfectly.

4806. You assume that the Admiralty would be attempting to protect commerce during the period immediately following the outbreak of war?—Yes. I think it is probable—it certainly would be right—that efforts would be made to indirectly protect it even before, by what I call the "shadowing" of the hostile cruisers.

4807. And that it would not be necessary at the outbreak of war that all ships should be withdrawn from the specific work of commerce protection to the work of watching the enemy's main squadron?—My view is that it would not be desirable to withdraw the whole of them—as you cannot prevent the escape of individual hostile ships. There were some very conspicuous instances of that during the Russian war of 1854-56. I suppose there never was a more complete and unchallenged command of the sea than France and England on the one side held against Russia on the other. In spite of that there were two or three Russian cruisers that did get out—they were out before the war. The "Aurora" and "Diana," I think, and they were out in the Far East. One of them was lost afterwards in an earthquake in Japan. They did not do very much. They did nothing, in fact, because we had ships, as it happened, in that part of the world before the war, and they were looking after their own safety instead of trying to destroy our mercantile marine.

4808. In your opinion, we must have some force detailed to deal with cases of that kind?—Yes, that is my opinion. I think that the above particular instance is one which is worth dwelling upon, because if we had not had a force out there they would have had our then rising maritime commerce in the Far East at their mercy.

4809. Then may I ask you to continue the evidence suggested in your précis?—By no means the whole of the shipping under our flag is engaged in conveying food-stuffs and the raw material of our manufactures to the United Kingdom, or in carrying our home products abroad. In war British ships would cease to visit our enemies' ports; but, as there is a practical certainty that some States would remain neutral, our

shipping—of course, if adequately defended—could continue to ply between the respective ports of the States in question. There is no reason why the conveyance of commodities from Brazil to Chili, for instance, should not continue to go on in British ships, cargoes being owned by Brazilians, and return cargoes owned by Chilians. Often enough the cargoes would not be British owned, though the ships carrying them would be. If we assume that the national guarantee will cover the ships, but not the neutral owned cargoes, it is improbable that our shipping engaged in this particular trade would be much benefited, because foreign shippers would choose for the conveyance of their goods neutral vessels not liable to capture. This is a point which seems to deserve full consideration.

4810. Have you considered whether, if our shipping were withdrawn from such trade as that, there is sufficient neutral shipping to take it?—I think there might be sufficient neutral shipping to take that part of the trade, or at all events a considerable part of it. Where the neutral shipping would, I am satisfied, be incapable of taking up extra work, would be in the work done by the ships of the respective belligerents to the countries of the two belligerent sides. If there were a war between France and Germany, for instance, no French ships would go to a German port, and no German ships would go to a French port. If you put the British Mercantile Marine in the place of that of one of those two countries, as it is on a very much greater scale, no neutral Power would be able to take that up in addition to its own work. Of that I am satisfied. That is a question of arithmetic, I think. But between neutrals like, say, Siam and China, there is a considerable rice trade, and I think that might be taken up by some of the neutral States, or at all events a great deal of it, if we could not do it.

4811. Then we come to your second period?—Hostilities, yes. When, after the outbreak of hostilities, a sufficient time has elapsed to allow of the formation of a fairly accurate conception of the enemy's methods, it will probably be found that no plan of defending our ocean commerce will be worth its cost except that of active naval defence.

4812. By the plan of defending you mean such a plan as one of these schemes of guarantee or insurance?—Yes. What we must do, or else give up the struggle, is to get food-bringing and raw material-bringing vessels into our ports, and provide for the safety of those carrying our products to friendly countries. I am obliged to confess that I cannot see how any system of Government insurance or of national guarantee will make these things certain, or even help much towards making them certain. The attack on an enemy's maritime commerce is a branch of naval warfare, and I am quite unable to understand how you can make war without fighting. Fundamentally, the proposal to introduce the national guarantee is based on the hope that, by administrative arrangements, and not force, you will be able to prevent your enemy from carrying out his intentions. It was quite plain during no inconsiderable part of the recent Russo-Japanese war that no conceivable Government indemnity or national guarantee would have ensured the arrival of a store-bringing vessel at Port Arthur or Vladivostock. At the same time, vessels arrived with out little interruption at Japanese ports, without any hope of indemnity or guarantee.

4813. That is rather the point that I put to you earlier, that what you want to secure is that the vessels shall arrive; it is not sufficient merely to encourage them to sail?—Yes, it is absolutely indispensable. It is like a besieged fortress; if you do not get the supplies in, the fortress must surrender.

4814. There has been a fear expressed by some of the witnesses who have been before us that, owing to the risk of loss, and the high premiums charged, vessels might be laid up or transferred to a foreign flag. Do you think there would be much risk or possibility of transferring British vessels to a foreign flag?—There are two very serious obstacles in the way of that, one of which would probably be prohibitive. The first is the internal legislation of the different countries to which it might be proposed to transfer the ships. It is a thing that cannot be carried out very rapidly; unless nearly all the neutral Powers were to suddenly introduce legislation in a very short time to alter their present laws, the transfer would not be practicable. It is very difficult to conceive a sufficient rapidity of legislation in those countries to make any real difference. The second obstacle is that, if the neutral to whom the ships were transferred was not powerful on the sea, no really strong belligerent would acknowledge the transfer. The belligerents would say: "These are bogus transfers, and we do not intend to acknowledge them." What could Belgium do, for instance, or Portugal, or Greece, in those cases? So that I do not regard with any very serious apprehension that question of transfer. Of course, a powerful neutral—for example, the United States—if it chose to permit the transfer, would be able to insist upon the transfer being respected by the belligerent. It is quite powerful enough to do it. We should be, if we were neutral. But it is a thing that must be done immediately; it must be a question of hours, not of weeks. I do not think I am exaggerating when I say that if it was not done in seventy-two or eighty-four hours, or something of that sort, it would not have much effect.

Admiral Sir C. Bridge, G.C.B.

23 July 1907.

4815. You anticipate, I think, from the evidence that you gave before the Royal Commission, that there would be a great Government demand made upon the mercantile marine on the outbreak of war, or just before it?—Yes, I think it would be very large indeed. Of course, we have got a very large mercantile marine to draw upon, and there would be a great many vessels which would be out of employment. But when I was out in the Far East, during the early part of the war between Russia and Japan, the Japanese Government made an enormous demand upon their mercantile marine, both absolutely and relatively. They virtually absorbed the whole of it at first; their figures ran into many thousands of tons. I do not know that we could not do that in case of war with a big naval power, and satisfy our demands out of the unemployed shipping that was directly unemployed owing to war.

4816. Of course, in so far as the Government demands afforded employment to the unemployed marine, they would remove all temptations to transfer, or to lay the ships up?—Yes, certainly.

4817. Would the demand be very large for strictly naval purposes apart from the possibility of a military expedition being at some point contemplated?—Yes, absolutely without reference to the numbers of merchant steamers, very large indeed. The mere coal would take many thousands of tons. I should think you may say that, roughly, a single battleship will require quite 2,000 tons of coal a month in war. It is safe to allow for that. That is, supposing that she is at sea, going at a fairly high speed, on 20 days of the month, and that she is 10 days in harbour, and still burning coal then and keeping her fires all ready, I am inclined to think that 2,000 tons a month is not an outside figure. It would not be safe to allow much less than that.

4818. (*Sir James Mackay.*) What will she burn a day?—I am allowing about 100 tons a day for all purposes when she is at sea. That may be a little outside, but you do not know when you may have to proceed at very high speed indeed. But if she were going about 12 knots, allowing for occasional bursts of high speed, I do not think 100 tons a day too much.

4819. No; I should have thought it was rather under, if anything?—I do not think it is at all too much. Perhaps the 20 days at sea out of the month is an excessive estimate, but it is a safe one, I think.

4820. (*Chairman.*) And besides coal there would be considerable amounts of other stores?—Yes, a great deal of other stores.

4821. And I suppose some ships require to be taken up as auxiliary, apart from store ships?—There is fresh water. My impression is they would have to follow the fleets about with fresh water for their boilers. That is a large item. I had calculated it all out, and I am sorry I have not got the figures here, for the fleet I commanded in China. They were big, decidedly, and I think we should not have been safe with much less. Then there are other stores; there are provisions.

4822. Ammunition?—Ammunition. That is a very uncertain quantity, but you would have to have it.

4823. I may summarise your view, may I not, as being that it is only in the first period, which you have denominated the period of uncertainty, that you think the scheme of indemnity would be any advantage at all?—That is my opinion; but I would like to add there is not much harm in it if it does not divert the public from the real, true way of defending their commerce afterwards. I do not think

Admiral Sir C. Bridge, G.C.B.

23 July 1907.

it would operate. I think when you began to defend your mercantile marine (which has been done over and over again, and certainly is not an impossibility) it would not operate. If people had to pay for it they would not do it.

4824. And you would deprecate in the strongest possible way anything that taught people, or tempted people, to believe that they could be protected in any way except by a strong Navy properly used?—That is my belief.

4825. (*Sir George Clarke.*) I think that you feel that we must not contemplate a sudden stoppage of trade either just before or just after the outbreak of war?—No, I think that we ought not to contemplate it.

4826. That is a thing we cannot contemplate with equanimity?—Certainly we ought not.

4827. But it is at that early period that the scares to the shipping community would be most likely to arise?—Yes, exactly.

4828. And that is the real justification of any system of national insurance?—That appears so to me.

4829. The only sound justification?—Yes.

4830. It is to be an antidote to panic among the shipowning and ship-using community, not in any sense an additional protection to trade?—Exactly.

4831. You spoke of Port Arthur and Vladivostock in the late war. We may take it that those were practically blockaded ports, not technically, but practically?—Practically, yes.

4832. And also that the Japanese lay straight between those ports and the outside world?—Yes.

4833. So that that case was geographically and in every respect exceptional?—Yes.

4834. We cannot argue from that to anything that could happen in the restriction of the use of our own ports?—Except, I think, that we might argue to this extent, that the object of commerce-destroying as against this country is to make the British Isles a blockaded area. How near they can get to that, of course, is uncertain, and depends upon our own Navy. But commerce-destroying, as directed against the British Empire, would aim at a complete blockade of the British Isles, as complete as that of Vladivostock. So that, although I cannot dispute what you say, and I quite agree that the Vladivostock and Port Arthur cases were exceptional, they are exceptional more in degree than in the enemy's intention.

4835. But as regards the facilities offered to the enemy, the case is exceptional?—Yes.

4836. The difficulties would be enormously great in imposing anything like a real blockade on our coasts?—Yes, certainly. Our geographical position helps us, as you suggested.

4837. Then if a guarantee were a good thing merely to prevent panics and to prevent stoppage of ships running by reason of inflated insurance, do you think the adoption of such a guarantee by the State would have any tendency to cause us to neglect or to starve the Navy?—I can only say I hope it will not. I do not quite see that it should; but, to prevent its being so, I think it should always be carefully pointed out that this guarantee is not meant to supersede or take the place of any properly-directed naval defence.

4838. I take it, if there is any chance of that sort of thing arising you would much rather have nothing at all; anything would be better than a system which seemed to justify people in reducing the strength of the Navy?—I think so. At the same time, I am confronted with the condition that during that period which I have called the period of uncertainty naval defence cannot operate, or it can operate only imperfectly.

4839. And it is in that period that the moral support of a system of insurance might be beneficial?—Yes, but if not accompanied by a proper explanation it might be likely to have the mischievous effect of encouraging people to reduce their Navy.

4840. I rather gather that you consider that the Admiralty ought to take direct steps for the protection of trade apart from any operations it might have to carry out against the enemy's battle fleet?—My impression is that the Admiralty exists for that purpose; that we should never go to war, either aggressively or defensively, for any purpose really but protecting our trade

4841. And, of course, the operations to be carried out might be said to be twofold, one to restrain the enemy's battle fleet and the other to protect commerce, and I gather you think that though the first is essential the second should not be neglected?—That is exactly what I think.

4842. And if we were at war with a Power whose battle fleet was considerably inferior to our own, we ought to have a considerable margin of strength to devote to the direct protection of commerce?—That is my belief.

4843. From your historical studies generally, do you think it is easier to protect commerce now than it was in the sailing days?—I am inclined to think that it is easier; easier for us at all events.

4844. So that we probably need not expect a higher annual percentage of captures than occurred in the French wars?—No, I should not think so.

4845. Have you ever heard of the idea of using the mercantile marine as a bait to lure out the enemy's fleet to its destruction?—No, I cannot say that I have.

4846. That was not considered at the Admiralty in your days?—No, I think it seemed, as far as I have studied that question, to be more likely that the pressure of public opinion in the belligerent country would force its fleet to go to sea and do something than that the fleet would be lured by any bait of that kind.

4847. Do you think that much can be done by careful prearrangements made at the Admiralty for giving the earliest directions and instructions to shipping in different parts of the world?—Yes, I think a good deal can be done in that way. Of course, it must not be the only arrangement; it must be accompanied by others.

4848. But do you think that arrangements of that kind ought to be made in time of peace?—Yes, provided that they are not made too definite and precise. A sort of general arrangement should be made, I think, for each area.

4849. In any case you think that the Admiralty ought to have a definite policy as regards the protection of commerce?—I must say I think so. I cannot conceive what it exists for otherwise. The Empire depends upon its maritime position, and I presume the Admiralty exists primarily to defend the maritime position on which the Empire depends. The freedom of our commerce on the sea is a very essential element in that matter.

4850. Of course, that might be regarded as the passive aspect of the protection of commerce as opposed to the active aspect, and you think that both must be carried on simultaneously?—I think so.

4851. That is to say, you must be prepared to attack, and you must also be ready to oppose commerce-destroying in all parts of the world?—Yes. I believe that in all cases of what you might call strategic arrangement in time of peace, both by land and sea, what has to be defended has got to be considered as well as the power of the force that is likely to be brought against it. For example, we talk about the north-west frontier of India, and the defence of various outlying parts of the British Empire. When we multiply them or increase their importance, I think they do affect the arrangements for defence. The principal thing is the power of the assailant, but these also enter into it to some extent, I take it.

4852. So that where there is a very great volume of trade to be attacked, you think it is not sufficient merely to provide proportionately to the strength of an enemy's fleet, but that there should be a margin having regard to the density of the volume of trade?—Yes, I think so. I would draw a sort of parallel between that and the Metropolitan Police Force. That increases with the area of valuable property which would be more or less at the mercy of the burglars if there were not proper Police arrangements made to meet them. I do not think the Police Force entirely depends on the number of probable burglars; it depends on their number and activity, and also on the amount to be protected.

4853. If the number of people who went out with a large quantity of cash in their pockets were largely increased, that would be a completion of the parallel, would it not?—Yes.

4854. (*Sir James Mackay.*) I think you say that you do not expect to see many vessels transferred to neutral

flags in the event of our going to war?—No, I think that is the case, but I should like to point out specially that I do not expect to see many transferred quickly.

4855. I suppose it would be just as difficult for the neutral, in the event of our losing command of the seas, to get to this country as it would for one of our own ships?—That is my belief.

4856. Therefore, there would be no great object in transferring British ships to neutral flags in order to carry on trade to this country?—No, not in order to carry on trade to this country.

4857. (*Mr. Beauchamp.*) I think everybody will admit that no scheme of national insurance could insure our supplies coming to this country, but the object of any system of insurance primarily would be to keep down the premiums of insurance?—Yes.

4858. And, as such a scheme, it would be defensible, you think?—Yes.

4859. Especially that would be the case during the period of which you have spoken as the period of uncertainty?—Yes.

4860. But during that period of uncertainty not only would the insurance world be in a state of apprehension and hesitancy, but throughout the business world that feeling would prevail, and business would be a great deal handicapped and confined during that period of uncertainty. It would not go on as before?—I am quite prepared to take it from you that it would be so. I believe it would be so, but, of course, my opinion on that is not worth much; I do not speak as an expert on that matter at all.

4861. But it is reasonable to assume that it would not only be the insurance world that would be in that state of uncertainty and hesitancy, but all throughout the whole business world would be the same?—Yes.

4862. A good deal of doubt at present exists, I believe, as to whether any country would directly go to the attacking of our commerce, because it is considered to be strategically unsound. That seems to be the prevalent idea at the present moment, and therefore we need not fear it so much. Do you agree with that view?—I agree with it to this extent, that if you base your war policy, so to speak, or your strategy, on the destruction of your enemy's commerce, you are making a mistake. But it is one of the things that does help to injure an enemy, therefore if you make it a subsidiary element of your strategy I do not think it is unsound. In the case of the United Kingdom, which is different from that of any other country, there is a greater justification for attacking our commerce than that of the commerce of other nations, because the object of the war would be to enclose you in a blockaded area—a blockaded fortress, if you like to so call it—and if your supplies could be cut off the fortress would fall, and the blockaded area would have to surrender. It is very unlikely that any foreign navy would be able to do that, but it would help to make us very uncomfortable. They would get to some extent a run for their money if they did it. There would be very great temptation on their part to do it. It would undoubtedly injure us to some extent.

4863. Therefore, although it might be generally considered to be strategically unsound, it might be the wisest thing on the part of any enemy of ours to go directly to attack our commerce, because it is our most valuable point?—Yes, I think it would be. I think that if they made it a reasonably subordinate element in their strategy they would be right in adopting it.

4864. Then I think you said it might be that a good many vessels of our enemy might have got away previous to the outbreak of war, and gone out to rather distant ports in order to attack our commerce?—It is not very easy to understand why certain nations have outlying fortified ports unless they have got some idea of that kind.

4865. Do you think there would be much difficulty on the part of those vessels being able to coal, so as to keep the sea?—Yes. I think after a certain time, if we make the proper arrangements, their difficulties would be very great indeed. They would very likely have a fairly good time in the beginning.

4866. Would there be any country other than France able very successfully to attack our commerce, do you think?—There is no doubt that the geographical position of France and certain of her outlying ports is superior to that of any other foreign country. Of course, the United States, with regard to the other side of the Atlantic and part of the Pacific, are geographically favourably situated from a strategical point of view for the same purpose.

4867. Of course, the United States would be able to operate very successfully on the Pacific coast against us?—Yes.

4868. But that would not prevent our receiving our supplies on this side. Do you think the United States would be able to interfere very effectively against our being able to get our supplies to this country?—Of course, they would not have much call to do it, because if they were at war with us an immense amount of our supplies would *ipso facto* stop; what comes from them would stop; but they would be able to operate with immense advantage against the line from Canada to this country, for instance.

4869. (*Chairman.*) Would they be equally favourably suited for dealing with the Argentina trade?—Not equally, but they would not be very unfavourably situated, at all events as to anything that comes from that side of the Atlantic.

4870. (*Mr. Beauchamp.*) Then, with the exception of fast vessels being able to get away from German ports before the outbreak of war, do you think we need have very much fear of any attack by Germany upon our commerce; do you think she would be able effectively to attack it?—Of course, there is our trade with Sweden.

4871. But, apart from the Baltic, and part of the North Sea. She would not be able to attack the commerce from India, Australia, the United States, or Canada?—No. The difficulties in her case as regards those trades would be very great indeed.

4872. Practically the only nation which could really do us very much harm would be France?—The nation that could do us the most harm, I think, would be France. I do not know whether it is a proper thing to introduce into this inquiry, but possible future territorial rearrangements in the Adriatic might have a considerable effect on our Eastern trade through the Mediterranean.

4873. You think it would be necessary for us, during the period of uncertainty and apprehension, as far as possible to shadow anything which might attack our commerce?—Yes, that is my opinion.

4874. That necessitates a very large number of cruisers, I suppose?—Yes, a large number, at all events.

4875. I do not know whether I am right in putting the question to you at the present moment, but do you think that we have a sufficient number of cruisers for that purpose?—I have thought on that point, but, of course, I should like to refresh my memory with statistics of our own and other countries before I answered that question definitely. I could give a general answer to your question, I think, in this way, and say that the number of cruisers that we ought to have is a very important element.

4876. (*Mr. Huth Jackson.*) I understand, in dividing the time of war into two periods, you intend to indicate that the risks to our merchant shipping during those two periods are different?—Yes, different.

4877. And that the second period is a period which no prevision can possibly be made for. It must depend on the results achieved in the first period?—You could make this provision. I think the question which was asked just now would relate to that. Your cruiser force would be a provision for the second period.

4878. That would be for the first period, would it not?—No. During the first period my belief is that naval protection will not operate. It cannot operate until the war begins, except very indirectly by shadowing. After the war has begun, during what I consider a sort of sub-period of the period of uncertainty, it will only operate imperfectly, because we must ascertain what the enemy's methods are going to be.

4879. And it is during that first period that you think the dangers to merchant shipping might be very serious indeed?—I think it is not the actual danger so much as the apprehension of it which might possibly lead to a laying up of the ships, and it would be extremely difficult to regain our position after that, and it is in that period that I think the indemnity would perhaps help to keep things right.

Admiral Sir C. Bridge, G.C.B.

23 July 1907.

4880. Would it be your idea to limit the indemnity to any period, or to have it spread, if it is to be given at all, over the whole period of the war?—Of course, holding the views that I do, I do not think it is very important. I think that, if people have to pay for the indemnity, when they find that the Navy is defending their commerce properly they will simply give up paying the extra sum. If we make the arrangements which we must make, or else be defeated in war, we must defend our commerce so effectively that it will gradually be borne in on the minds of all people concerned in the shipping trade that they really need not pay the extra money.

4881. Then, if you had any system of insurance, you would have a system of insurance under scheme B—that is, with a payment—with the idea that the advantage is only to be practically taken up during the first of the two periods you mentioned?—Yes, that is my belief, and I may mention why I do believe it—because in all the previous wars the insurance rates went up in the earlier part. When the Government through the Navy did get properly to work the rates went down. In the American War of Independence they never did get properly to work, and therefore the rates did not go down. But in the last great war it went down, and remained very little above the normal, I think; and, curiously enough, that was so in those trades which passed close to the enemy's ports, showing the belief, which was justified by the result, in the efficacy of the naval defence.

4882. Then you would include in that indemnity vessels trading between two neutral ports, and not coming to this country at all?—I did not know what the proposal would be. I think you would have to extend it to British ships, at all events.

4883. British ships, wherever they are?—Wherever they are, otherwise you would make a very invidious distinction, so to speak. But whether it would have any effect if you did not extend it to the cargoes which would not be British-owned, I could not say.

4884. Would your inclination be to extend it to cargoes in British ships, irrespective of their ownership?—That is a thing I really hardly know.

4885. It has been suggested to us that it should be only applied to vessels coming to or going from this country. That, however, you would not limit it to?—No, I think not. I think it would defeat itself almost, if you did that.

4886. (*Chairman.*) I think, in your evidence before the Royal Commission, you hazarded an estimate of the probable percentage of loss in a serious naval war?—Yes.

4887. You put it at 5 per cent.?—Yes.

4888. Is that 5 per cent. per annum?—Yes, 5 per cent. per annum. My calculations, if I remember right, really came out about 4 per cent., but I thought it was perhaps safer to give a somewhat higher figure. Captain Mahan, if my recollection is correct, put it about 2½ per cent., and the conclusion I came to was that perhaps his percentage was a little low.

4889. That was a percentage of what the loss had actually been?—Yes.

4890. Was your 5 per cent. the same?—Yes; my 5 per cent. was based on the loss of the previous wars. I am sorry to say I cannot remember the details of the calculation, but I did arrive at somewhere about 4 per cent., and, to be on the safe side, I put it in my evidence about 5.

4891. That was after making allowances for what you pointed out to the Royal Commission—that a good number of the so-called captures of that time were really arranged surrenders or sales?—Yes. If there were to be a chart of the world prepared, and every capture of every ship recorded on that, you would be astonished at the proportion which took place in the English Channel. That is a place which we certainly ought to have been able to defend, and facts have come out since that there were arranged transfers Apparently, although I do not know that there is any black-and-white evidence for it, our Government were aware of it, and did not try to stop it. It was said by Frenchman that Napoleon's army was shod with shoes made in England.

4892. Do you think you can draw any very safe inference from the rate of loss under the circumstances at the beginning of last century to what the rate of loss would be under the circumstances of to-day?—I think it ought to be done with very great discretion. As I said just now, in all these matters, when you begin to study them closely, you find yourself brought up against innumerable conditions which had not occurred to you before, and the only way to come to any satisfactory conclusion on the part of those who have to do the work is to take all those conditions into consideration.

4893. And, at the same time, to bear in mind that the best results at which you can arrive will be very speculative?—Yes, quite so.

4894. Do you happen to remember whether in your estimate you included the coasting trade, and trade between England and Ireland?—The coasting trade on the south coast was certainly included.

4895. Probably, then, all the trade was?—I think all the trade was included.

TWENTY-THIRD DAY.

Tuesday, 30th July 1907.

PRESENT:

The Right Hon. AUSTEN CHAMBERLAIN, M.P. (*Chairman*).

Sir GEORGE SYDENHAM CLARKE, G.C.M.G.
Sir GEORGE H. MURRAY, K.C.B.
Mr. H. LLEWELLYN SMITH, C.B.
Mr. EDWARD BEAUCHAMP, M.P.
Mr. HENRY NEVILLE GLADSTONE.
Mr. FREDERICK HUTH JACKSON.
Mr. GEORGE H. DUCKWORTH (*Secretary*).

Mr. JOHN ST. LOE STRACHEY, called and examined.

Mr. J. St. L. Strachey.
30 July 1907.

Mr. Strachey, in a preliminary memorandum,* had submitted:—

(1) That it is of vital importance that during war, as during peace, the freest possible access and exit shall be secured to those who desire to import or export food and other merchandise.

(2) That it is within the power of the Government to assimilate the conditions under which commerce is carried on during war to those which prevail in peace:—

(a) By maintaining command of the sea.

(b) By undertaking to make good any losses which owners of ships and cargoes may sustain by running their ships and embarking their cargoes as freely during war as in peace.

(3) That it would repay the Government to guarantee immunity from pecuniary loss, because it is the fear of destruction, rather than the actual destruction, of ships and cargoes that has to be dreaded from the public point of view.

(4) That heavy rates of war insurance on British shipping would result from this fear, and would severely handicap British trade in neutral markets.

(5) That to prevent fraud the State should only undertake war risks where the owners had insured against ordinary sea risks, and only for the amount insured against sea risks.

(6) That in case of dispute the policy should be adjudicated upon exactly as it would be in peace time between owners and insurers, the Government being in the position of the defendants.

4896. (*Chairman.*) You have seen the reference to the Committee, I think?—Yes.

4897. And I think you have also seen the evidence that was given on the same subject before the Royal Commission on the Supply of Food and Raw Material in Time of War?—I have read that, but it was some time ago, and I have not refreshed my memory with it. It was three years ago, I think. I read it at the time, and I am afraid that only a general view of it remains.

4898. Will you give us generally your views on the subject?—I should like to preface them, please, by saying that I cannot claim in any sense to be an expert. I am merely giving the baldest pious opinion of a journalist looking at the thing purely from the public point of view. That led me, as it must have led a great many people, to the belief that our position would be strengthened, and commercial risks would be minimised, if in some way or other we could make the shipowner and the trader each feel that war need not be a cause of panic to him, and need not be a cause of putting him at a great disadvantage as compared with his foreign competitors. I can really best express my feeling by saying that what one wants to do is to try and assimilate, as far as one can, war conditions to peace conditions. Roughly, let the Government say to the shipowner and the merchant, "You can go ahead in war time just as in peace time, and we will see you through—first of all by our naval strength, and secondly by indemnifying you against war risks in such a way that you shall not be handicapped by having to pay very large amounts—or, indeed, any amount, large or small—for what may be called the reverse of a bounty on your trade."

4899. For what would be a penalty charge, in other words?—Yes, a penalty which acts as it were like bounties to foreign shipping and to foreign merchants. The Government would go on, "We want to put you in exactly the same position as your rivals are, and we do that by saying that we take upon ourselves any *bonâ fide* war risks; and we guarantee you not merely by means of the Navy to keep the seas open for you, but if you have any loss we will indemnify you for that loss."

4900. You want to avert a panic?—Yes.

4901. No doubt some panic might be caused by fears which had no real foundation in fact, but such fears would be quickly over, would they not?—They might be; but as they would have something substantial behind them, they might do a great deal of damage even in a short period of time.

4902. The serious cause of damage or danger would be actual seizures, would it not?—It would be; but I put it that there must be a certain number of seizures. Therefore it becomes what I should call an inverted gamble. People are not playing for a benefit, but they are, as it were, playing to avoid a risk. No man knows on whom the risk may fall. There will be only a certain amount of captures, but every man thinks they may fall upon him.

4903. The general experience of war is that prices rise all round, is it not?—I presume so.

4904. Not merely insurance rates, but freights rise, and the prices of commodities rise?—Yes.

4905. Owing to that uncertainty?—Yes. You mean, of course, everything connected with seaborne commodities; on an island, everything connected with commerce comes in or goes out by sea.

4906. In the first place, I am confining myself to direct seaborne commerce?—Everything that comes in or goes out must be affected. That would mean a great

* *Vide* note p. iii.

Mr. J. St. L. Strachey.
30 July 1907.

deal, because it would be governed by the fact that this is an Island State, and the war premiums would come into play at once. For instance, take a case like Fashoda. What was the war risk that the people had to pay in the case of the Fashoda scare? I have heard it stated that it was something like a 30 per cent. increase.

4907. What I was rather pointing to was that it seemed to me that the premiums hold a very small place among the different disturbing factors that would be at work?—I see the point.

4908. Part of your commercial ships may be taken up for warlike purposes, and part of your trade must, in any case, be stopped for a time, because it is a trade with the belligerent or belligerents, the nation or nations with whom you are at war. There must be, therefore, in the direct seaborne commerce, a great disturbance owing to those circumstances; and to the abstraction of ships from their usual employment by the military and naval authorities, and to other ships being thrown in to compete by being turned out of the trade in which they have hitherto been engaged?—Yes.

4909. In addition to that, the panic would not be confined to what was going on at sea, would it?—No.

4910. And you might have a great disturbance in the London money market?—Yes.

4911. Even amounting to a panic? Sir Robert Giffen, I think it was, suggested to us that the first thing which would bring clearly home to us that we were engaged in a great European war would be that our bankers would be unable to cash our cheques?—I quite realise that, but then my answer would be, I think, "At any rate let us withdraw one element of panic and of the exaggeration of prices." If there is one that we can withdraw, let us withdraw that; even if it is not entirely effectual, it will have done something. For instance, if I might employ a metaphor:—Suppose there was a bridge which suddenly became very dangerous. Suppose also that it was necessary to get things into a town across that bridge, and that the difficulty was to get people to risk their lives in going over or to risk their carts and horses. It would certainly increase the chance of getting the city supplied if you were to say, "Well, if your horses and carts fall in, we will at any rate see you harmless."

4912. The offer of a guarantee would certainly cause more ships to start upon their voyages?—Yes.

4913. But it would not necessarily cause more to arrive?—No; but then we are arguing on the assumption that the amount of captures—and I think that is the experience, is it not, of history?—is not so very large as compared with the effect of the risk of capture. The actual number of captures was not so large, even in the case of the "Alabama"; it was more a case of panic caused by the "Alabama" than of the actual number of ships she took.

4914. Are you suggesting that it was mainly the "Alabama" which destroyed the American marine?—No, I would not say that, because I know there were other causes as well. I was thinking of it only as an example; but the captures of the "Alabama" did have a great panic effect on American shipping.

4915. No doubt; and you would eliminate panic as far as you could?—Exactly. I would say we cannot control all the causes of the rise in prices, but those we can get rid of we will. If the sea risks were eliminated by Government action that would tend, at any rate, in the right direction.

4916. Your view being, I gather, that it is rather the fear of loss than the actual amount of the loss that would probably be sustained which is the serious factor?—Exactly. It is A's fear that the loss will fall upon him.

4917. It is the fear of each individual?—Yes, that the loss will fall upon him.

4918. And though the loss in the aggregate is not large, it may fall upon him, and will be very large if it falls upon him?—Yes. There will be no general average in his case; he will have to bear it all.

4919. Supposing nothing is done, do you anticipate that as a result of those fears premiums will be very high?—Exactly.

4920. What do you expect to be the result of that? Some witnesses have argued in favour of a scheme of this kind on the ground that otherwise there would be a tendency to transfer shipping to a foreign flag. Other witnesses have come before us who have argued that it would tend to keep the prices of commodities nearer their normal level. Which of the two arguments is it that commends this scheme to you?—I should hardly like to venture to express an opinion as to the transfer to foreign flags. Clearly there is a very technical question there. I do not know whether the difficulties are very great, or whether they are small. I know it is always said popularly that it would happen, and that it will not be an unpermanent transfer, with transfers back when the war is over; but that, once being transferred, ships will tend to remain under the foreign flag. I could not venture to express an opinion on that supposition. On the other point I think it is a matter of common sense that if a large extra premium has to be paid, it must act like an increase of freight. Supposing it was 30 per cent.—but I think you said that was very much too large; but even if it was 10 per cent., it would be a disadvantage to the shipowner and to the merchant.

4921. In giving the guarantee you would make no distinction between different kinds of cargo, I suppose?—I should have thought not. I think it would be very difficult to discriminate.

4922. You have seen both the draft schemes that we have sketched out, I believe?—Yes.

4923. Which of them do you prefer?—I very much prefer A as the simpler.

4924. That is the scheme for the free grant of indemnity?—Yes. It really endorses every policy, does it not, with a Government war policy?

4925. Do you contemplate that it would be necessary for the Government to make an actual endorsement?—It would not matter; except that they would want the shipowner and the owner of the cargo to come before them in some way, and give proof that they had insured against the ordinary perils of the sea.

4926. Would you insist that the shipowner should be insured against ordinary perils?—I think he should either insure or have some scheme for insuring himself. I fancy the great companies insure themselves, do they not?

4927. Yes?—Of course you could not exclude them, because of that; but they would have to give evidence that they were in effect either insuring themselves or had insured outside, because otherwise, after the cargo and the ship had perished, it would be very difficult to know what the value was.

4928. Would you do that then with a view to taking the value insured against for the marine risk as being the value which you would pay in case of a war loss?—Yes, so as to prevent an unlimited liability.

4929. That would have a tendency, would it not, in regard to the ships at any rate, to make the value rather high?—I suppose it would; but then that would have to be controlled. At present there is a limit to it, and a man does not care to over-insure his ship. As he would have to pay the premium on that, I think that would prevent him.

4930. But inasmuch as there would be no premium for the war risk, would you not say that the greater the war peril, the greater the temptation to over-insure?—Yes. It would not be a complete check, I quite admit, and I presume that it would only be a guarantee of indemnity. The Government would still have it open to them to show that the man had over-insured. It would not be a wager with him, of course.

4931. Have you considered at all—perhaps not—how that would affect commercial transactions and the whole credit system on which our oversea commerce depends?—No, I am afraid I have not considered that.

4932. The cargoes are nearly always financed by bankers or others, are they not?—Yes.

4933. Who have as their security the bills of lading and the correlative insurance policies?—Yes. Do you mean that this would have a tendency to inflation?

4934. If you allowed the Government to re-open the policy after the loss, the banker or the bill discounter might hesitate to accept the bills. He might say, "I no longer know where I stand; as long as it was merely a marine risk, I had a policy and I knew that I was covered up to the extent of that policy; but now there is the war risk as well, and you say that if the Government department, after the loss is made, is dissatisfied, it may re-open the policy; in that case, I no longer know whether I am covered or not"?—Even in the

present case it can be re-opened, can it not, in the case of fraud?

4935. Yes, in the case of fraud, but that is a rare case?—I should suggest that the Government would only protect themselves as the present insurer protects himself.

4936. I should think you might take it that they would be almost always bound to do so. Would you have the claim as against the Government decided by a Court of Reference, or would you leave the dissatisfied party to the ordinary remedy in the Courts?—I should prefer the latter. That would seem the simpler process, but of course the Government might not think that was wise.

4937. Your whole object in fact would be, as I think you said at the beginning, to assimilate the war conditions to the peace conditions as far as possible?—Yes.

4938. And to encourage the commercial classes to go ahead with their commercial operations just as if we were not engaged in war?—Yes. You should keep the sea roads open as far as possible, and brush away every obstacle you could.

4939. Supposing the other belligerent were intending to prey seriously upon our commerce, there might be moments and particular places where it was not desirable to have a great mass of our commerce afloat?—That would be so.

4940. Where, in fact, to tempt your own commerce out would merely be to afford a fat harvest to your opponent?—Yes.

4941. Do you think that could be met by general Admiralty regulations?—I should have thought it could. We are assuming, and I think we ought to assume, that you have secured the command of the sea, and that it is only a sort of piratical power that would remain in the hands of your enemy. He is only preying upon your commerce with a few ships, but he has not secured the command of the sea. If you have lost the command of the sea, then I think the offer of a guarantee of this kind would be too great an obligation for the nation to assume.

4942. I quite agree; I am assuming throughout that we have command of the sea?—Then I would run the risk, because I cannot imagine that it would be so very great if we really commanded the sea. One would not want to deflect the Admiralty policy by commercial considerations, but still, if they had got command of the sea, and they had found there were places where a great deal of shipping was attracted, they would surely be able to put enough cruisers on them to prevent anything except occasional damage.

4943. But when all is said and done, there must be considerable losses?—Yes.

4944. I do not suppose you have formed any estimate really that you would care to give to the Committee of what the losses would be?—No; I feel that to be impossible.

4945. And I do not think any other of our witnesses have cared to pin themselves. But though the losses might be, and probably would be, a very small proportion of the whole, they would aggregate to a very considerable amount, would they not?—They would, I should imagine, but then it would be a small total compared to the war expenditure as a whole.

4946. You would not be afraid of the Chancellor of the Exchequer adding this to his other burdens at such a time?—No. It is a dangerous line to take, but I think it would be small compared with the enormous cost of the war; it would only be a small percentage of that, and it would be very much less than the general damage done by the dread of capture.

4947. And you do not think it would be necessary for them to make any special financial provision beforehand to meet it?—I should not have thought so. There again, one must be speaking in the dark. I do not know what the total loss caused by the "Alabama" and other cruisers were.

4948. (*Mr. Beauchamp.*) We paid three millions?—I know we paid three millions for that.

4949. (*Chairman.*) And they experienced a difficulty in finding the people to divide it amongst?—That is so; but that would be a very insignificant amount compared with what I am afraid the war expenditure would be.

4950. I should imagine that our losses must be larger?—Yes, they would be, of course.

4951. (*Sir George Murray.*) I think I gathered that in your view there would in any case be a considerable rise of prices on the outbreak of war, whether there is an indemnity or no indemnity?—I rather accepted that from the Chairman, but a condition of war always seems to tend to put up all prices except stocks, I suppose.

Mr. J. St. L. Strachey.

30 July 1907.

4952. And that rise would be due to some extent, probably to a large extent, to real causes such as shortness of freight?—Yes.

4953. And one of those real causes would be any actual loss by capture?—Yes; or the fear of it.

4954. I was coming to that. Then in addition there would be a rise you think due to purely sentimental causes—the fear of more captures than actually take place?—Yes; or rather I should like to put it, please, the fear on the part of A B. that it would fall upon A.B.'s shoulders and not upon somebody else. It is just the reverse of the gambler's hope; a gambler hopes that he will be the man for whom the lucky number will turn up, and so in this case each shipowner would imagine that he would be the man who would be unlucky.

4955. Still, whatever rise does occur in that way you would say would be due to pure sentiment and not to any real cause at all?—I would not say pure sentiment; but it would be largely based upon, I would not say sentiment exactly, but men's natural cowardice—natural desire not to run a risk, natural fear of risk.

4956. Let me put it in another way: the level of prices would depend very largely upon the supply, and of course upon the demand?—Yes.

4957. The supply would not be affected by fear of capture at all; it would only be affected by the actual losses incurred?—Is that so? The risks may prevent people from sending out their shipping—perhaps very stupidly—when they ought perhaps to run the risk. But if a man in a panic at the beginning of a war locks up his ships that will affect the supply, because there will be fewer carriers on the road, and so fewer goods could come in.

4958. There might be a shortage of supply due to that cause, you think?—Yes.

4959. Should we be doing any more by an indemnity scheme than eliminating what I call the sentimental rise of prices, or such part of it as is due to an unwillingness to engage in trade at all?—No, I suppose we should not.

4960. Then the question arises whether it is worth while, in order to eliminate what I call the sentimental part of the rise, to embark upon such a very large measure as a scheme of indemnity would be; I gather that you think it is worth while?—Yes. My inclination would be to think it is. I do not know whether I attribute undue importance to the sentimental view, but it seems to me that traders and all persons dealing with a risk in money are very much affected by those considerations, at any rate to begin with. I suppose that people might get accustomed to the risk and write it off, as it were, and say "Well, the amount of capture is not very great, and we will run the risk." But at first, with an unknown amount of risk, they would tend to exaggerate it very much.

4961. That would probably last for a very short time, would it not?—It might; but still a good deal of damage might be done. Wars we rather presume will last for a short time, and I expect they will not be very long; but a great deal of damage might be done in six months or three months, and I should think there would certainly have to be six months of war before people would get accustomed to the sense of the war risk.

4962. And a great deal of real damage, you think, would be done?—A good deal of damage would be done by what you term the sentimental risk.

4963. The people would very soon find out, would they not, how much of the risk was sentimental and how much was real; the rise of prices would probably tempt them to come in, and it might correct itself in that way?—Yes; but still they would always have this extra war premium to pay against their rivals. They would surely think it worth while to insure, and they would always insure against the war risk, I suppose.

4964. But then the risk might be a diminishing one?—Yes, it might be.

4965. It might be very small after a little time?—I can hardly imagine an insurance company or Lloyd's

Mr. J. St. L. Strachey.

30 July 1907.

saying "The risk is so small that we practically need not charge you any extra premium." They would always want an extra premium.

4966. (*Sir George Clarke.*) In your *précis* you say that it should be within the power of the Government to assimilate the conditions of commence in war to those of peace; but you realise that in any case there would have to be delays and deflections of commerce, which would, to a considerable extent, alter those conditions?—Yes.

4967. That would be inevitable?—Yes.

4968. You have told us that you think freights would rise in war?—Yes, I presume so.

4969. Even if prices did not?—I should hope that in the case of a national guarantee freights would not rise so very much, unless the Government had taken up a very large amount of shipping. That would really depend, would it not, on the nature of the war?

4970. We have been told generally by our witnesses, and they have agreed, that there would be practically a rise in freights; but that it does not follow that prices would rise in war, except in the cases of those commodities the production of which was stopped or checked by the operations of the war. Do you agree in that view?—I speak with great diffidence, but I cannot quite understand, if freights rise, and rise considerably, why prices should not rise. Surely, to take an extreme case, if freights were doubled, as it would then cost double to bring the goods to this country, that must affect the price?

4971. That would be the price of delivery, but not the actual price of the commodity; that would be the price affected merely by the difference in the cost of transit, and not the actual price of the commodity?—Still, that would affect the price to the consumer here.

4972. Yes, it would, as far as we are concerned. Then the case for national insurance would be strongest, of course, in a war with a naval power?—Yes.

4973. And that power would also probably be a large commercial power?—Yes.

4974. The two generally go hand-in-hand, so that the cessation of the enemy's commerce which we may presume, and the probable large demand for taking up transport for naval and military purposes here, might produce an increased demand for the use of British shipping?—Yes.

4975. Then the neutral ship, which was carrying what might be classed as contraband, would also have to pay a war insurance?—You are meaning that most things would be declared to be contraband, presumably?

4976. That is possible, and that has been rather our experience in the late war. In the late war the neutral ships were insured rather heavily, I believe?—Yes.

4977. And that we must expect in the future, it seems to me, unless some general arrangement as regards contraband is arrived at at The Hague, which does not seem very likely; so that the neutral would probably have to bear the weight of a war insurance?—Yes, presumably.

4978. Therefore it amounts to this, that the conditions of war and peace in actual fact, whatever we do, must differ very considerably?—Yes.

4979. If the ship and the cargo were insured against all losses, it is possible they might find themselves in a rather more favourable position in war than in peace, is it not?—Yes.

4980. If that were the case, would it not be reasonable that they should contribute something to the purchase of their State guarantee?—Yes, I can assume that; but, of course, if you make them pay, unless you can absolutely adjust it, you still may be putting a handicap on them, may you not?

4981. It would be a question of degree in that case?—Yes.

4982. But it would not be unreasonable to expect that they should pay something?—If they were making something.

4983. Is it not possible that they might be able to pay rates which, at all events, were considerably above the normal premiums for marine risks?—Yes, I presume that might be so. But that would have to be a matter of experience, would it not? As the Government would only do this by grace and favour, if they found that the shipowners or the merchants were making too much, they could re-adjust that by some form of taxation.

4984. I gather that your main point is that it would be the fear of destruction, rather than the actual destruction of shipping itself, that would be the main factor in war?—Yes.

4985. And that it is probable that fear would operate most powerfully at the outset of war, before the general conditions and the general action of the Navy were understood?—Yes.

4986. Would not the effect of a free indemnity to the shipping interest—for which, of course, they would have to pay nothing whatever—be to inflate values, and rather to encourage fraud?—There would be that risk, no doubt; but I should have thought that might be guarded against.

4987. There would be more tendency to exaggerate if the indemnity was absolutely free than if something was paid for it?—Yes. If somebody promises to give one a free fire insurance of one's house, one's tendency would be to state the value as high as possible.

4988. Might it not be regarded by all the other interests affected by war as rather an inequitable thing that one set of interests should be apparently completely protected, and all the others should suffer?—I would meet that by saying that the supreme thing is to keep the ocean roads open in every respect.

4989. Do you think that argument would satisfy the general public as to the justice of the proceeding?—I do not know that. There is not any class, is there, that would be able to say they were so little affected by seaborne commerce that they were being very much damnified by the war risks, and yet they were getting nothing?

4990. I suppose there is no class in this country that would not suffer, and no interests that would not suffer severely, directly or indirectly, in the case of a great war?—Yes, but would they not mostly suffer like, say, the cotton trade in Lancashire, from want of access, want of cotton coming in, and from the risk to the piece-goods going out?

4991. Would it meet your views if the State offered insurance at fixed maximum rates, varying in certain zones and voyages, so that the ship and cargo owners would know at once the utmost that would be demanded of them for war insurance?—I should think that would meet it to a certain extent, but I should have thought that if the Government was going as far as that it would be simpler to assume the whole risk. Of course, your suggestion would be very much better than nothing.

4992. If that were done, then, if the State rates were fixed too high, of course the underwriters would take all the business and it would go on as usual?—Yes.

4993. On the other hand, if the State rates were fixed too low, and the captures were more than the general estimate on which they were based, the State would stand to lose?—Yes.

4994. But not very much? That would meet your fear of the effect of a panic, would it not?—To some extent.

4995. To a very great extent?—Yes, to a considerable extent.

4996. And it would put the shipowner and the cargo owner in a much better position, because they would know their maximum liabilities?—Yes.

4997. Then directly a period of panic and alarm had passed away the rates would drop and would gradually extinguish themselves automatically?—Yes.

4998. Do you not think that would be an advantage?—I think that would be; but at the beginning of the war the shipowner, at any rate under that scheme, would not feel so secure as he would be if the Government were going to indemnify him in any case. I am speaking now of the non-fraudulent shipowner, the *bonâ fide* shipowner.

4999. He would not feel as secure, you say?—At any rate he would be handicapped a little.

5000. He would be handicapped a little, but you have rather conceded that his conditions might be such that he could probably afford to pay the maximum rate fixed by the State?—Yes; I have assumed, for the purpose of argument, that he could. That really turns on the question of contraband, does it not?

5001. (*Mr. Beauchamp.*) You said you thought there would be a sentimental rise in price, and that each

individual would think that he would be the one to bear the loss?—Yes.

5002. If he can cover that risk by insurance there would be no fear of that, would there?—I rather adopted the word "sentimental" from Sir George Murray. Though he could insure against that, he would have to pay a higher price than he now does, would he not? Therefore he would be handicapped to a certain extent. Sir George Clarke met my point on that by saying that he would not be handicapped against his foreign rival, because the foreign rival would probably be paying also; but I was assuming that the foreign rival would not pay—that only the Englishman would.

5003. The individual shipowner would not really suffer—I mean he would not anticipate that he was to be the one going to suffer and his neighbour not, would he?—Because he had insured?

5004. Yes?—But in doing so he would have to pay. It would be a different risk than he has now, and he would have to pay a larger premium than he does now.

5005. Possibly he would pay a larger premium?—Therefore to that extent he would be handicapped. Say that The Hague alters the present law as to contraband, he might be in a position of having to pay 10 per cent. more than the foreign trader, and that 10 per cent. would be a very serious handicap.

5006. I think you said it was essential to any scheme of this kind that we should have command of the sea?—Yes, I think so; otherwise the risk would be too great for the Government to undertake.

5007. If we lost the command of the sea would you withdraw the guarantee?—I do not like to contemplate that at all. You would have to reconsider it, of course.

5008. If you withdrew it, you would be destroying confidence at the very time you wanted it most?—Yes. I can understand, as a desperate war measure, the Government facing the risk and doing everything to attract cargoes in and out of the country. Even if we had lost the command of the sea temporarily, we had better put down our last shilling in keeping the ocean roads open.

5009. Then would it not be better to wait till we had lost command of the sea before we adopted any scheme of this kind?—No, I do not think so. I could not contemplate our losing command of the sea, but even if we maintained the command of the sea we might at the same time, owing to panic or panic conditions, have given a very serious handicap in the wrong direction to our commerce.

5010. But so long as we have the command of the sea, you do not anticipate that there will be very heavy losses?—Not very heavy losses, but there might be a very heavy panic.

5011. Which would still subside?—Probably, but it would subside, let us say, in a 10 per cent. handicap against the English shipowner.

5012. (*Mr. Huth Jackson.*) You referred to the disturbances of prices in time of war; that would be to a large extent of universal application, would it not; that is to say, it would apply to the goods and shipping of every country and of every trade?—I presume so.

5013. What you particularly desire to arrive at, I take it, is to remove from British shipping the disadvantage which it would labour under as compared with neutral ships?—Yes.

5014. For that purpose you propose to give them a free indemnity without payment on the part of the ship or the cargo?—Yes. The Government in fact would say, "It is our business to see that the war does not make any panic applicable to you at all, and that the war does not increase your cost of carrying on your business."

5015. Would you give that indemnity to all the cargo in British ships, whether the cargo was neutral-owned or British-owned?—Yes, I should be inclined to.

5016. Might I for one moment imagine two vessels in New York Harbour—a neutral vessel and a British vessel. The neutral ship would have to pay some war risk premium, I take it?—I think it would, but that would depend, would it not, upon the law of contraband. I should not like to express a definite opinion.

5017. I think you may take it that would be so; even in peace time there is always a premium on the war risk—even at the present moment?—Do you mean to say that a man if he only insures against ordinary perils of the sea pays so much, and if he insures against war risks, even in profound peace, he pays a little more?

5018. Yes. Therefore if you gave a free indemnity to British ships, and those two ships were in New York harbour, you would be giving a distinct bonus to the British ship as against the neutral ship?—Yes, I suppose you would.

5019. Do you think the British nation and the British Parliament would sanction such a thing as giving a bonus to a shipowner like that?—I think under those conditions they would, though perhaps theoretically they should not give it. I used to be inclined to think you should give it to all the world—that you should say to anybody who does any trade with us, "We will give you an indemnity if you are taking goods away from Britain, or if you are bringing them in." I think that might be an advantage, but you would not have the same control over foreigners in your Courts, and so you could not have the same means of preventing fraud. Therefore I am afraid you must limit it to the British shipping.

5020. But you still think that in spite of its being a bonus it ought to be given?—I think so in time of war, because I think that the danger is so great, and the benefit also is so great, of keeping your ocean roads open.

5021. Would you be content if the scheme only removed the penalty or disadvantage attached to the ship?—Yes, I should be quite content if that could be really removed, so that the British shipowner would not be handicapped in any way. All I want to do is to assimilate the war conditions to the peace conditions.

5022. To assimilate the war conditions to the peace conditions, you only require to put the British ship on the same level as the other?—That I admit.

5023. You do not really want to give him a bonus?—No. My objection to the partial payment under Scheme B is that it would be so difficult to find out what that was. What I want to do is for the Government to leave him harmless, so that war shall not increase his charges.

5024. If a scheme could be formulated which would remove the disability without giving the bonus, you would prefer it?—I should prefer that, because I do not want to give a bonus.

5025. (*Mr. Llewellyn Smith.*) In a question by Sir George Murray, it was suggested to you that even if the risk of capture was wholly covered by indemnity, still the prices would tend to be forced up through the actual losses, because they would diminish the supply available, and thus would increase prices. I think you agreed to that?—If I may say so, I should agree scientifically, of course; if there is any diminution of supply I am bound to hold that such diminution must tend to increase prices.

5026. I was going to ask you whether, on reconsideration, you would not somewhat modify your acceptance of that, so far as regards what would happen in the long run. Is it so evident that it would force up prices? May I put to you a case? Take a cargo of corn destined for this country and captured, and suppose that it is not sunk, but is taken into the enemy's port and sold; would it not still form part of the world's supply of corn?—Presumably.

5027. It would not come to us?—No

5028. But it would set free other corn which might come to us?—Yes.

5029. Apart from the increased cost of carriage would that operate on the world's supply, and therefore force up prices?—No, not in that case.

5030. If, on the other hand, the corn was sunk, of course, that would make so much diminution, not in our supply only, but in the world's supply generally?—Yes.

5031. Not in ours more than anybody else's?—No; but, for what it is worth, it is a diminution.

5032. Which will force up the world's price of corn?—Yes, as far as it goes.

5033. But it would not operate specially to make a difference in price in this country as compared with other countries?—No, except so far as it represented our share of the world's diminution.

5034. Exactly—which would be a very small thing, of course?—Yes.

5035. The capture of that cargo would be operating on the whole supply of the world?—Yes.

Mr. J. St. L. Strachey

30 July 1907.

5036. So that really, in the long run, and apart from what has been called the "panic rise," or the "sentimental rise," the special rise in the price of corn in this country would be governed by the rise in freights, and nothing more?—Presumably, unless you can imagine a great destruction of corn, which is almost unimaginable—a sinking of millions of quarters of grain, which is not likely.

5037. But still, that would affect other countries as much as ourselves?—Yes, it would, and we should share in the loss.

5038. (*Chairman.*) Nothing has been said to you so far about the crews or about the masters of ships. Do you think there would be any danger that a guarantee would make the master less alert to escape the enemy, and less willing perhaps to take risks that he would otherwise take?—I have tried to think of myself. I say again that I speak with the greatest possible diffidence, as no expert. I was thinking of it the other night, and wondering whether the fact of my own house being well insured really made me more careless in case of fire, or made my servants more careless. It is very difficult to tell, but I do not think one's servants, because they know one is insured, say, "It does not matter," and leave the lighted lamps about, and so on.

5039. No; but are the cases quite parallel? Take the master of a vessel which has been sighted by an enemy, and the question is whether he shall run from her with a chance of having a shot put through him and being sunk there and then, with the loss of himself and his crew, or whether he shall surrender. Would not the fact that his owners were fully guaranteed possibly turn the balance and decide him in favour of the safer course?—I should think it would, if we are contemplating uninsured ships on the ocean; but my idea would be that no ship would go out uninsured; it would either be lying up, or else it would be insured privately at a great cost. The master of the ship would not differentiate between a loss that would fall on Lloyd's and a loss that would fall on the Government. So that influence would be the same whether you had a Government guarantee or not, would it not?

5040. I am not quite sure?—We are not contemplating any ships going about the ocean uninsured. They would be insured at Lloyd's. Of course, it is a very difficult point.

5041. There is one other point I was going to put to you. There will be a considerable disturbance in the mercantile marine whenever we go to war, on account of new risks which seamen undertake, will there not?—Why new risks?

5042. Because to their ordinary marine perils which they are accustomed to risk they will add all the war perils, which are very different things?—Yes.

5043. I do not know whether you saw a case reported in this morning's papers of certain seamen who were going out to Hong Kong, and were informed that they were expected to go to Sasebo in the late war; the courts have decided that they had a perfect right to refuse to go?—No, I did not see that. My answer to your question would be that I can only eliminate certain unfavourable influences from among the influences which tend to interfere with commerce. But because there are other unfavourable influences, such as a man's fear for his own skin, which you cannot eliminate, there is no reason why you should not get rid of as many unfavourable influences as possible.

COMMITTEE ON NATIONAL GUARANTEE FOR WAR RISK OF SHIPPING.

ANGIER, Sir THEODORE, Shipowner. (Qs. 694-844)

I.

DESIRABILITY OF STATE GUARANTEE.

(1) Because in no other way can a real indemnity be obtained. (2) Because the Mercantile Marine is of the first importance to the maintenance of the Empire. (Q. 697.) No purely naval protection would be sufficient. (Q. 698.)

MUTUAL INSURANCE AND INDEMNITY.

The first conference between mutual indemnity and protecting clubs was held in 1904. (Q. 704.) "We got, as we thought, the best men possible, the indemnity and protecting associations, which practically include nearly the whole of the British tonnage one way or another . . . . . to thresh the whole thing out. From the beginning we always approached the question with how much it would cost us privately. . . . . We first tried to see if we could find out a peace premium, such a premium that when war came there would be a fund to pay losses out of. Then we found that came to a very big figure, and of course we were hampered by a limited capital, because, even taking up the whole of what we could compass in our clubs, altogether something like £100,000,000, it came to too heavy a premium. Then we thought the best way would be to have the peace premium as low as possible, supplemented by an increased rate as soon as war broke out. But on all the points, when we came to look into it, we always came to grief on the question of the capital indemnity. . . . . First of all, the capital was always too small, and then the means of collecting the mutual contributions was impracticable." (Qs. 706-9.) Besides, a policy which contemplates an increased premium in time of war is liable to the higher stamp duty even in time of peace. (Q. 712.) In mutual insurance a fund is not levied. When a loss occurs a call is made, and the loss is distributed pro râta on the capital. (Qs. 714-15.) The percentage of shipping covered was about 30 per cent. of the total shipping of the country. (Qs. 744-5.) The conclusion was that when it had been considered how much money could be collected, it was insufficient to cover the possible, or even probable, losses. (Qs. 747-8.)

TRANSFERS.

Where the risks of capture are great, owners, as during the Franco-German war, would adopt a sort of temporary sale or transference to a neutral flag. "Money passed, cheques were exchanged, so that it meant a sale, but the idea was that they would be retransferred afterwards." In most cases they were not retransferred, as the owners were glad to get rid of them. In some cases law suits ensued. (Qs. 699-702.)

SHIPPING IN WAR TIME.

The depredations of a cruiser are limited, as "she is entirely bound by her bunkers. She could do a certain amount for, say, a week or a fortnight, with the biggest, and then it is all over. She has to go to rebunker; she is then going into the jaws of capture nearly always. On the whole, I certainly think that we should be very much surprised at the comparatively small losses we should suffer; they would be sharp and short." (Q. 800.)

RUSSO-JAPANESE WAR.

"There was a contract I had in partnership with a Russian friend to send out 50,000 tons of coal towards the end of the war. The only way we could get the ships was to give them a policy of insurance of a certain value; roughly, it was the ship's market value of the day, and we had to pay for that policy 30 guineas per cent." (Q. 762.) Coal being double contraband, contraband in itself, and going to a blockaded port—Vladivostock. (Qs. 763-4.) "We wanted at all risks" to continue the voyage on the off chance of one or two ships getting in, but the underwriters came in, and bargained with the owner not to go on. "So that they really deprived the Russian Government of the off chance" of some of those ships getting in. (Q. 765.) The risks on Japanese goods began at 5s. per cent., and never went higher than 30s. to 42s. per cent. (Q. 767.)

II.

NATIONAL INSURANCE.

The question is to arrive at the reasonable premium to be levied in order approximately to cover the losses. (Q. 718.) The risks for the State to insure against are Lloyd's free from capture and seizure clause. (Q. 719.) "Like all underwriting, it would be a bet. The Government would back peace . . . . . and the owner would back war, and then you have to get at the price." (Q. 728.)

NATIONAL INSURANCE PREMIUM.

Ships might pay 5s. per cent. Though "I would not like the 5s. rate tacked on to my name." (Q. 780.) Payment would be compulsory upon shipowners. (Q. 729.) Ships are worth from £30 a ton to £7 or £8 a ton for tramps. Eighteen million tons of shipping on the British register at £10 a ton would amount to £180,000,000 (Q. 779), which would produce £450,000 a year. (Qs. 796-8.) The Government would be put in funds, without reckoning interest, to the extent of something over £11,000,000 after a peace lasting 25 years. (Q. 799.) There should be a provision for power to the Government to charge so much extra in time of war, and a clause for surrender value. (Q. 736.) There should be a common rate for every class of ship (Q. 749), whether fast or slow, if entitled to fly the British flag. (Q. 821.)

III.—CONDITIONS.

VALUES.

There are three ways for valuing: (1) Giving the shipowner free option as to price. (2) Fixing the value for the indemnity as the value of the all risk policy that the owner was running the year before the war broke out. (3) Basing the indemnity on the value paid by the shipowner for his ship, less a reduction. (Q. 790.) The tendency would be for the man not to over-value, unless he felt certain of war coming on (Q. 784.)

ONLY SHIPS TO BE COVERED.

There is no necessity to touch merchandise. (Q. 758.) "When the goods come in, after they have paid the underwriters' insurance, the Government might subscribe so much to the price. It seems a simpler way to me. It is a most intricate thing if you start on such an indemnity for goods; you could not possibly apply this peace premium to it." (Q. 759.)

SETTLEMENT OF CLAIMS.

Prompt settlement is an absolute necessity. (Q. 755.) It could be managed by a board consisting of a couple of shipowners, a couple of underwriters, and one average adjuster. (Q. 751.) Payment should be made when shipowners suffer loss by detention owing to compliance with the orders of the Government. (Q. 731.)

BALFOUR of BURLEIGH, The Right Hon. Lord, Chairman of the late Royal Commission on Food Supplies in Time of War. (Qs. 1-67.)

I.

VIEW OF THE ROYAL COMMISSION.

The Commission were favourable to the idea that the State should undertake to make good to shipowners and traders losses incurred to the shipping by the enemy in time of war. All signed the main Report, and even the minority conclude their own reservations with an emphatic recommendation for the appointment of a Committee to consider a scheme in detail. Such objections as there were were mainly directed to the practicability of any scheme. (Qs. 4-6.)

The question of insurance or indemnity came primarily before the Commission as a means of securing our supplies and avoiding fluctuations. (Q. 15.)

Some scheme is primarily desirable in order to get rid of difficulties owing to changes in naval warfare. The Navy will now endeavour to protect shipping, not by convoys, but by bottling up the hostile navy in its own ports. (Q. 7.)

"I think the practically uniform opinion of the shipowning community is that if there is no convoy and no indemnity, the temptation to lay up the ships and keep them here will be very great, which would then cause an economic rise in the price of freights." (Q. 10.)

PRICES IN WAR TIME.

The economic rise is to be distinguished from the panic rise. Some suggest that the price of corn would go up to 80s. or 200s. a quarter. "I think it is absurd to say that wheat could remain at anything like 50s., 60s., 70s. or 80s. a quarter here when it was at 30s. on the Continent a few hours distant, and we have ports all round the country to which things would be brought." "I do not believe you can blockade these islands." (Q. 14.)

TRANSFERS TO A NEUTRAL FLAG.

"I am a profound disbeliever in the effective transfer of shipping from our flag to another. . . . I do not believe it can be done in a hurry. I do not think that the prize courts of other countries would be easily induced to accept a transfer . . . and I doubt very much whether capital could be got to insure that it was really paid for, and I do not see how delivery could be given when ships are all over the world." Professor Holland thinks that it is not a danger which need be seriously apprehended. The loss of American shipping was as much due to the fact that they did not keep pace with the new forms of iron building, as to the relatively small damage which was done to it by the two or three Confederate cruisers that escaped. (Q. 8.)

TRANSFER OF TRADE.

"If our export trade has to pay any increased cost for insurance in time of war, it will be seriously handicapped in markets in which we are competing with other manufacturing nations. . . . I should be much more afraid of these markets once being lost not being recovered than I should of the shipping being transferred to another flag." (Q. 18.)

SEA RISKS AND WAR RISKS.

"I do not see how you can divide war risks into two classes without great risk of dispute and difference of opinion." (Q. 63.)

II.

THE OBJECT OF A NATIONAL GUARANTEE.

The exact words in Paragraph 229 of the R.C. Report are: "To minimise, so far as possible, or even to eliminate altogether, the amount by which war insurance would increase the cost of commodities, and to prevent British shipowners being compelled, owing to the disadvantageous position in which they might find themselves with reference to neutral competitors, either to lay up their ships, or transfer them to a neutral flag." (Q. 10.)

FORMS OF NATIONAL GUARANTEE.

Three suggestions were put before the Commission: (1) That the cost of insuring against war risks should be reimbursed to the British shipowner or merchant by the Government. (2) That the Government should take the place of underwriters and insure shipowners and shippers against war risks at premiums which, as there would be no question of making a profit, could be made much smaller in amount than if undertaken as a commercial enterprise. (3) That the Government should make good to shipowners and shippers all, or part, of their losses by capture in war. "I dismiss the first of these suggestions as open to every objection which may be brought against either of the other two, and others besides." No. 2 may be called National insurance and No. 3 National indemnity. (Q. 10.) "I attach great importance to the use of distinct phraseology, and to the same phrase connoting the same thing, because before us people came in and talked of national insurance when they meant indemnity, and so on." (Q. 9.)

INSURANCE AND INDEMNITY.

"If the premium charged for the insurance is one which is not calculated to recoup the cost to the Government, it is indemnity practically in everything except the name." (Q. 12.) The higher the premium and the more self supporting the scheme, the more it approaches insurance, but the higher the premium the less you get rid of the economic rise in the cost of freight on bringing foodstuff into the country. (Q. 13.)

NATIONAL INDEMNITY.

"I prefer what I describe as National indemnity." (Q. 9.) The moral effect of an indemnity in making things go on as they would in peace time is so great, and the risk of real loss so little, that much may be risked for the sake of having a uniform scheme. (Q. 37.) The safety of the State is the supreme law, and the risk must be taken of indemnity being regarded as a special protection for the benefit of a particular industry at the expense of the whole community. (Q. 33.) Since you include the cargo as well

as the shipping in the indemnity, you justify making it a National charge (Q. 34) . . . and cannot represent it as conferring a special benefit on a particular industry. (Q. 35.) The advantages of indemnity are very much greater than the advantages of insurance. (Q. 57.) Indemnity is the cheapest method of getting rid of war scares. (Q. 60.) It is as useful as a much stronger fleet. (Qs. 37.65.) "Unless the fleet is maintained at what I call an extravagantly high rate compared with others, you will be liable from time to time to scares on the food point, because at certain seasons of the year the supply of food in this country gets down at its worst to merely enough for six or seven weeks. That is generally in June, July or August, just before our harvest." (Q. 66.)

COST OF INDEMNITY.

The conclusion of the Commission (Paragraphs 241-242) was that if 1 per cent. of our shipping were lost the cost would be £1,800,000; if 2½ per cent., £4,500,000; and if 10 per cent. were lost, £18,000,000. The total British tonnage entered and cleared at United Kingdom ports in 1903 was 58 million tons, and as the cargo carried was worth £600,000,000, the cargo carried per ton of British shipping = £600,000,000,

58,000,000

or about £10 5s. The total British tonnage engaged in foreign trade in 1903 was 8,900,000 tons, which may be valued roughly at £10 per ton. Therefore the total amount at risk would be—

Value of shipping (£10 × 8,900,000)	£89,000,00
Value of cargo (£10 5s. × 8,900,000)	£91,000,000
	£180,000,000

(Q. 26.)

PAYMENT FOR INDEMNITY.

The consumer will ultimately in one form or another have to pay practically all the extra cost of what he consumes. In this matter the consumer and tax-payer are convertible terms. Better to put the cost on taxes than to leave the individual consumer to pay it as best he can. (Q. 17.)

EFFECT OF AN INDEMNITY ON NATIONALITY OF GOODS.

Ownership a very important and complicated point. "Ownership of the stuff we are bringing in consigned to us is probably ours, and therefore, being the private property of a belligerent, would be liable to capture by our opponent. If the stuff is being exported and is the property of the person to whom it is going, presumably a neutral, it would perhaps not be liable to capture because it is his property." (Q. 18.) But "there is nothing which a probably hostile prize court will not decide if it suits them as a matter of policy." (Q. 21.)

MR. WILDING'S SCHEME.

This is a combination of the two ideas underlying national insurance and national indemnity. He suggested that a premium of a fixed amount (5 per cent.) should be paid to the Government, and attached importance to some figure as a guarantee for the fairness of the claims which would ultimately be made in the event of loss by capture. He thought that the payment of a premium of 5 per cent. would involve the stating of a sum as capital value on which the premium would have to be calculated. (Q. 11.)

III.

CONDITIONS OF INDEMNITY.

"Nothing would have to be paid until a capture had actually taken place, and therefore there would be no justification for a rise of freight in respect of war insurance until war actually broke out." (Q. 17.) It would cover all cargo carried in British ships (Q. 50) even though the cargo was not British owned (Q. 51). It would cover ships trading between neutral ports, but not the cargoes if those cargoes were foreign owned. (Qs. 38, 40.)

If the captain and shipowner did not observe Admiralty instructions, the cargo-owner, if perfectly innocent, should receive the indemnity. (Qs. 48, 49.) Indemnity should be given to the owner of exported as well as of imported goods. (Q. 52.)

CONTROL.

The control on the part of the Admiralty ought to be made very stringent. (Q. 23.) Compliance with its instructions would be a condition of the indemnity. (Q 24.)

ISSUE OF A POLICY.

"I do not myself see any difficulty in ordering the shipowner who wishes to join in the advantages" of an indemnity scheme "to take out from the Government Department concerned what would correspond to a policy in the case of ordinary marine insurance, and in doing it he might be required to hand in all necessary papers to establish the value of his ship." This would give protection against unduly high claims. (Q. 25.)

DEVIATION.

"Supposing the Channel was unsafe and you could not get to London through the Straits of Dover, and we wanted food from the West . . . and the Admiralty said you must not go round the South of Ireland but you must go round the North of Ireland, and you must take the Pentland Firth and come down the East coast of Scotland; supposing they encountered a storm in the Pentland Firth and the ship was wrecked, then the wreck of that ship in the Pentland Firth, if due care in navigation were taken, would be a marine, and not a war, risk, but then that marine risk would never have been run except for purposes of war. Therefore I should be inclined personally, provided due care in navigation were exercised, to include that as a thing for which the man should be indemnified" (Q. 23.)

EXCESSIVE CHARGES.

"I see no difficulty in the Government taking powers to receive complaints from shippers of excessive freight charges, and, if that was to be substantiated, to inform the shipowner that he would forfeit his right to indemnity, or to exact some other penalty." (Q. 30.)

PAYMENT.

Promptitude of payment is essential. (Q. 63.)

BECK, MR. RAYMOND, Underwriter, Member of Lloyd's. (Qs. 1197-1484.)

I.

DESIRABILITY.

A State indemnity is very desirable, and is preferable to a scheme of insurance. (Q. 1200.) The knowledge that a scheme was in existence would prevent constant panics. (Q. 1298.) It is vital that the State should do something. (Q. 1471.) "I know that when Bradford spinners were supplying millions of blankets to Japan the contracts depended upon whether the rate was 5s. or 10s. per cent." (Q. 1469.)

SHIPPING IN WAR TIME.

The extension of wireless telegraphy will tell most in favour of the people who have got the most war ships. (Q. 1336.) It is unlikely that any first-class Power with which we were at war would sink ship and crew. (Q. 1456.) If many captures followed the outbreak of war, British shipping would become practically uninsurable, and would be laid up, or transferred to a foreign flag. (Q. 1457-9.)

THE RUSSO-JAPANESE WAR.

In the Russo-Japanese war practically all the risks were bad risks, because there is only one channel of approach to Russian ports. (Q. 1209.) The insurance market was not restricted until a certain zone was located as hazardous. Outside that zone it was unlimited, but when it came to the pressure point of dealing with the hazardous zone, the market shrivelled up very quickly." (Q. 1203.) Underwriters gauged the risks, as they rose from ½ per cent. to 30 guineas, accurately, and would not have been losers if the unexpected had not happened. ((Q. 1219.) The unforeseen event was the unusual blocking of La Perouse Straits by ice. (Q. 1378.) The premium of 30 guineas was meant to cover the fall of Port Arthur as soon as it occurred, but it was based on vessels bound for Vladivostock being able to pass through La Perouse Straits. (Q. 1379.) In the early part of the war colliers were insured at ½ per cent. from this country to Japan. Several were stopped in the Red Sea by Russian vessels, but were allowed to continue their voyage. As the war became more acute Russia did not wait to comply with the rules of warfare as laid down in books, and sank the vessels at once. (Q. 1221.) The losses which underwriters suffered were owing to shipowners insisting on proceeding with the voyage, "almost persisting in capture, if I may put it so." (Q. 1230.) The principles learnt by underwriters from the war were (1) That all possibilities or probabilities based upon the past are absolutely fallacious. (2) That no captures will be made in the future by an "Alabama," only by a war vessel of some sort, kept in absolute wireless communication with the mainland. "Instead of searching the seas without seeing a sail owing to ill fortune, they would simply net in everything." (3) That capture by the enemy will be looked upon as a very useful market by shipowners, and must be guarded against. (Q. 1266.)

MARINE INSURANCE—WAR.

"I think you may take it that the Lloyd's underwriters and the companies are most excellent judges. . . . even of a war risk." (Qs. 1216-17.) Their opinion came out extraordinarily right in the Japanese War. (Q. 1218.) War insurance in time of peace is confined to a very few trades, but it is habitual on the cargoes of nitrates from the West Coast of South America, and a war premium of 1s. 3d. per cent. is charged. (Q. 1331-2.) In time of peace the market for war risks is unlimited. (Q. 1202.)

MARKET FOR WAR INSURANCE.

"In the event of the outbreak of war the present market for insurance of vessels and cargoes against war risks would shrink up. . . . Prior to war, in the case of rumours or anything of that sort, there is a very large market, but after an outbreak, and in the probable event of captures, which I have reason to think would take place immediately, that market would almost entirely shrink up, and the few underwriters or companies engaged in the business would put the rates up to an absolutely prohibitive size for the carrying on of commerce." (Q. 1201.)

WAR RATES IN THE FUTURE.

If the North Sea were temporarily held by a foreign Power, the war risks on that portion would become certainly uncoverable at Lloyd's, except at enormous prices. (Q. 1209.) The rate would rise to 20 or 30 guineas per cent. (Q. 1212.) In any war we might be engaged in, if we had command of the North Atlantic the insurance on a cargo of grain from America would be "somewhere around 1 per cent." (Qs. 1274-5.) In a war with America the rate on grain coming from Canada, "if that end of the Atlantic was in the hands of the American fleet, would be about 70 guineas, I should think." (Q. 1376.) The United States would patrol the mouth of the St. Lawrence by one vessel with wireless communication, and would act exactly as the Japanese did. But suppose a Russian or French cruiser upon the great Atlantic trade routes, either the North or South Atlantic, without radio-cargoes being transferred to British ownership at their risk. (Q. 1427.) The Germans have no base that their ships could use at the present moment in the South Atlantic. (Q. 1425.) War premium will depend very much upon how the war is commenced. If the war is commenced by a sudden capture of merchant vessels it would create a very great scare in the insurance market, "and would scare out the greater number of careful, quiet underwriters, and would leave only the more venturous to deal with these questions." (Q. 1434.) A rate of anything like 2 per cent. or 2½ per cent. for long voyages is sufficient to stop trade. (Q. 1469.)

POSITION OF NEUTRALS.

A British ship being a belligerent would have to pay rather more insurance than a neutral. (Q. 1435-6.) Neutrals have to pay war insurance because "every conceivable kind of cargo becomes contraband for the time being." (Q. 1438.)

SEA RISKS AND WAR RISKS.

These may be taken by different underwriters (Q. 1483.) In the case of loss, the presumption would be that a ship had been lost by marine peril, and the marine underwriters would have to pay, unless they could prove she had been destroyed by the enemy. (Q. 1478.) A case of this sort happened with regard to a vessel going to Vladivostock. (Q. 1479.)

II.

PURCHASED INSURANCE.

State action of this kind may be dismissed, because (1) "You could only begin to sell insurance after the outbreak of war, which would be too late." (2) "When you were offering through a bureau, which might be opened in various places, to sell insurance, it would come to this—that when, we will say, the adequate premium for the risk was anywhere between ⅛ per cent. and ¼ per cent., Lloyd's and the insurance companies would be taking it under, and it would only be when those risks became worth 2, 3, 10, or 20 guineas per cent. that the man would go to your bureau and buy it for an eighth or a quarter." (Q. 1214.)

PAID FOR INDEMNITY—CARGO TAX.

"I should like to see inaugurated a system of indemnity by the State which would come into working automatically on the outbreak of war with any nation. It must, of course, be coupled with absolute restrictions as to what the shipowner does with his vessel if he is going to take advantage of it." Every vessel safely convoyed into port might contribute a tax of 1 per cent. on hull and cargo. This amount would not exceed in the case of cargoes of grain or meat the ordinary wastage in time of peace and prosperity. (Q. 1223.)

INDEMNITY WITH ZONE RATES.

Indemnity with a schedule of rates varying in different zones is getting very near insurance. (Q. 1304.) Underwriters probably would not undertake this business for the Government on commission. (Q. 1309.) As the war progressed, and as rates dropped below the State fixed schedule, underwriters would come in and gradually absorb the whole of the remaining business of the war. (Q. 1323.) There would be no difficulty in getting quotations at Lloyd's for any zone in which Lloyd's could do it under the fixed Government rate. (Q. 1321.) It would tend to keep the prices in the open insurance market down. (Q. 1324.)

INDEMNITY WITH TIME LIMIT.

It would be an immense stride towards indemnity to have free indemnity for all the vessels employed at the outbreak of war, and then to leave everything afterwards to the underwriter—and comparatively simple. (Qs. 1451-2.)

EFFECT OF INDEMNITY.

A free indemnity would probably result in foreign cargoes being transferred to British ownership at their

port of loading, instead of remaining under foreign ownership until they came to their port of landing. (Q. 1270.) Suppose an American owner shipped wheat to Liverpool in a British bottom, and it was seized by a vessel of the country with which we were at war. It ought to be released according to the principles of International law. Under present circumstances you might assume that the American owner would put his Government in motion to assert his rights, and recover his property. If we had an indemnity, it might be much simpler both for him and the American Government to claim against the indemnity rather than to go against the wrongdoer. (Mr. Chamberlain, Q. 1273.) We want to encourage foreigners to ship as long as they can. (Q. 1281.)

III.

CONDITIONS UNDER PAID-FOR INDEMNITY.

Shipowners should have the option of paying the 1 per cent. or not. (Qs. 1225-6.) The owner would pay 1 per cent. on the value of the ship, and so would the cargo owner, and they would try to make the value as low as possible. (Qs. 1349-51.) It would be an indemnity for certain voyages only, and would exclude those which the State considered too risky to be undertaken. (Q. 1231.) It should cover the risk of voyages begun before the outbreak of war, whatever they are. (Q. 1234.) The indemnity offered should be no more than the arrived market value of ship. (Q. 1239.) The shipowner would have to declare his route beforehand. (Q. 1229.) All ships that arrive should pay 1 per cent. on ship and cargo. The tax should only apply to ventures which are commenced after the outbreak of war. (Q. 1441.) There would be free indemnity for vessels afloat at that time. (Q. 1442.) The indemnity would be paid on value at port of arrival, which would include insurance, freight, and profit. (Qs. 1381-5.)

FRAUD.

Shipowners are very cunning. (Q. 1237.) And never make such good ventures as when they lose their ship. (Q. 1238.) The objection to allowing insurance above the indemnity lies in the probability of fraud. (Qs. 1414-17.)

VALUES.

Average adjusters could settle values of ship and cargo independently of the declared value in the policy, if necessary. (Qs. 1241-6.) The value of the ship at the time of capture, the value of the cargo at destination would be the values on which indemnity should be paid. (Q. 1252.) "There would be plenty of profit for the shipowners out of their vessels which bring in successful voyages for them not to feel hardly used when on one they only got the absolute market value." (Q. 1267.) To give less than market value would check enterprise. (Q. 1263.) "You would not always please the shipowner, but I see no difficulty in arriving at an equitable value." (Q. 1288.) It is always perfectly easy to arrive at what the value of the cargo is. The invoices of purchase can be secured, and the various documents, and the exact value, with a reasonable profit, can be ascertained. But the value of the hull is a more difficult question. (Q. 1312.) The values of marine insurance of ship and cargo would not be a satisfactory basis on which to pay indemnity. (Q. 1314.) It would necessitate a great deal of work to assess the value of each ship and cargo after its arrival, but not more than would be required to arrive at the value at which to take the insurance of a vessel which paid a premium before sailing. (Q. 1358.) Perhaps the ordinary system of clearances might be extended. (Q. 1361.) In each case you would have to get a certificate of the value of the different items of the cargo. (Q. 1370.) It would be necessary to see the bankers were properly protected. (Q. 1409.) The sale of cargo *en route*, as in the nitrate business, could be traced without difficulty. (Qs. 1398-9.)

A POLICY NECESSARY.

In order to come under the scheme, the shipowner would have to give notice to the Government at home. (Q. 1286.) Policies are used invariably as securities for raising money (Q. 1317), and therefore there would have to be some document passing between the Government and the ship and the cargo owner which they could use with their bankers. (Q. 1318.) The document would state values. (Q. 1320.) A mere acknowledgment from the Government might take the form of a policy. (Qs. 1410-11.)

ADMIRALTY CONTROL.

The Admiralty should have the right, not only to control, but to insist on the abandonment of a voyage at any given point. (Q. 1395.)

PAYMENT FOR DEMURRAGE.

Vessels detained in foreign ports on the outbreak of war and ordered to remain would be allowed free payment for demurrage by the State, until notice was given that the route was clear. (Qs. 1443-4.)

BINNING, Mr. J. T., Chairman of the Liverpool Underwriters' Association. (Qs. 1740-1962.)

I.

DESIRABILITY.

The view of Liverpool is that if the State interferes it will be more or less at the expense of the consumer. (Q. 1945.) It is unnecessary for the State to do anything, because there is no danger of panic or of the stopping of commerce due to high insurance rates. (Q. 1944.) It is unlikely that the premium would rise to a prohibitive rate in any but exceptional cases for very short periods. (Q. 1785.) "If the Navy is adequate, and if communication between the Admiralty and underwriters is good, premiums will be kept at a moderate figure, and there will not be that fear of captures which will really send prices up more than the actual captures themselves. Though some cargoes may be captured at first, the trade will find other channels." (Q. 1826.) Since our shipping is all over the globe, it is impossible to imagine that all, or even more than quite a comparatively small portion of it, would be in the war zone at one time. (Q. 1843.) Underwriters have facilities for salvage in the case of loss, in the case of stranding, and so forth, through associations which are not working for profit. "The Government would have to pay salvage companies, and would probably have to pay fairly heavily, and it would hardly have the other facilities that we have—all the accumulated information that we have, for instance." (Q. 1792.)

MARKET FOR WAR INSURANCE.

"Our experience in the last two wars, the Spanish-American and the Russo-Japanese wars, has shown that there is a very large market for war risks in this country." (Q. 1752.) "Competition amongst underwriters is so great that the premiums would not be unduly high." (Q. 1750.) There are some who will not write war risks, but they are in the minority. (Q. 1756.) Ordinary companies and private underwriters would be quite equal to taking the whole of the risks at reasonable premium. (Qs. 1760-1.)

WAR RATES IN THE FUTURE.

If we lost command of the sea we could not insure at any price. (Q. 1958.) Some time must be given in any case for naval superiority to assert itself, and this will be the critical time for insurance. The time required might be weeks or months. (Qs. 1960-2.) "I think that a great deal must depend upon our showing superiority at first, if possible. If we do that, there need be no fear of high war rates at all." (Q. 1957.)

SHIPPING IN WAR TIME.

"As a rule, war times are very good times for shipowners; there is a great deal of money to be made in them." (Q. 1765.) No rate of insurance could be put down as a prohibitive rate, because the rate would be taken by the shipowner along with his other expenses and added to what he would be willing to undertake the risk for, or it would be added to the ultimate cost of the produce. (Q. 1924.) War would no doubt stop up certain of the usual channels of commerce for the time being, but commerce would find other channels at once. (Q. 1925.)

TRANSFER TO NEUTRALS.

There is no doubt that the rates of insurance on our ships and on English goods shipped in British bottoms would be considerably higher than the insurance on neutral ships or on British goods shipped in neutral bottoms. (Q. 1767.) "If the fortunes of war were going very hardly against this country, I can quite understand owners transferring ships largely to a neutral flag." (Q. 1771.) It is very doubtful whether transfers would be allowed after the outbreak of war. (Q. 1769.)

RUSSO-JAPANESE WAR.

In the Russo-Japanese war, while contraband was being taken to Vladivostock the premium was high. (Q. 1761.) The rates being 25, 30, and 35 guineas per cent., and even 40 guineas in some cases. (Q. 1775.) In the case of Japan the premium may have been 3 per cent. at first, but as soon as the superiority of Japan was demonstrated the rate fell away to a very nominal one. (Qs. 1762-3.) Japanese vessels running from the west coast of North America to Japan with cargoes of flour were insured at 20s. to 40s. per cent., which is quite moderate. (Q. 1880.) The high rates to Vladivostock were kept down by competition. "As a matter of fact, the underwriters who wrote those risks lost money very largely." (Qs. 1914-15.) Russian risks were underwritten at Liverpool up to the fall of Port Arthur. There was always quite a free market on the Japanese risks. (Qs. 1955-1957.)

WAR WITH FRANCE.

There might be considerable captures in the Channel, and if these took place in the first week of war the rates of premium would rise accordingly. (Qs. 1773-4.) But they would only kill our manufacturing trade if they existed for any length of time. (Q. 1776.)

PRICES AND WAR RATES.

"Probably the fear of capture would have a greater effect on prices in this country than the actual captures themselves." (Q. 1748.) A rise in insurance rates would be one of the factors of rising prices, but not the only one, and not necessarily the largest. (Q. 1749.)

SEA RISKS AND WAR RISKS.

It not infrequently happens that a man is insured in two different offices or on two different policies. (Q. 1796.) "But in most cases the shipowner and the shipper or merchant would prefer to have the war risk covered by his own underwriter who has insured the goods, and when he can do it without undue expense he does so." (Q. 1798.) There might be serious difficulty in some cases in determining where the loss would lie. (Q. 1854.)

PANICS.

The best remedy against panic is an adequate Navy. (Q. 1874.)

ALTERNATIVE SCHEME.

"I can conceive of a scheme being devised" which would put a premium on arrivals rather than on losses. (Q. 1746.) It might take the form of a refund of the war premium, or a refund of a certain amount, on the arrival of the cargo. (Q. 1824.) Outward cargoes would have to be taken into consideration, as well as imports. (Q. 1838.) It might have a tendency to put up the premium because the owner, if he knew that he was to receive it back on arrival, might say to the underwriter, "I can pay you a good premium, because I am going to get it back again on arrival." (Q. 1900.) This scheme would not be any help to British commerce between non-British ports, nor to British commerce between British Colonies. (Q. 1939.)

II.

SCHEMES A AND B—OBJECTIONS.

(1) *General.*—In Liverpool "we think that these schemes would be more expensive than the present system, and would therefore not attain the desired object." (Q. 1745.) They miss their mark in tending to put a premium on losses rather than on arrivals. (Q. 1746.) They are based on the assumption that there would be a panic amongst underwriters in the event of war, which is not likely. (Qs. 1750-51.) Scheme A would be more largely adopted and availed of by shipowners than Scheme B, because with Scheme B the shipowner would in the first place go to his ordinary underwriter and do business with him, unless the Government's rate was lower. (Q. 1782.) Scheme A will really bountify the shipowner at the expense of the taxpayer. (Q. 1832.) It would be doubtful whether a shipowner would come in unless he was paid for his demurrage for delay (Q. 1894), even though an ordinary policy does not cover this loss. (Q. 1799.) The shipowner might be subjected to serious delay by Admiralty regulations. (Q. 1801.)

(2) *Undue Risks.*—"I think there would be a great many more cases of what I may perhaps call the prudent shipowner. To give an example, in the Spanish-American war a certain shipowner of very high standing had three ships sailing under the Spanish flag to the West Indies. Two of these ships were obsolete, and one was modern. He insured those three ships, I think at Lloyd's, against war risks for half a guinea per cent. for a period of time. The two old ships were sent to sea, and both were captured and confiscated by the Americans. The modern ship was kept carefully out of the way of the capturers, and is running still, I think. . . . There was no fraud in that case of any sort, and no suggestion of it at all; but one might say that it was a very fortunate thing for that prudent shipowner." (Q. 1805.) Even though an owner would only get the actual value of his ship, there would undoubtedly be an inducement to him to take hazardous risks, because he would get the full market value of his ships. (Q. 1905.)

(3) *Cost of working* would be much greater than the cost of the present system. "We do not see how any committee . . . is going to fix premiums and assess values and pay claims with what shipowners would understand to be promptness without at the same time admitting a great deal that is improper, and possibly even fraudulent." (Q. 1781.)

(4) *Values.*—In an ordinary policy valuation is a matter of bargain between the shipowner and the underwriter (Q. 1806), who determines his rate according to the value. (Q. 1807.) Values may rise after the ship is built, and, on the other hand, some steamers are depreciated almost before they are put into the water. (Q. 1820.) Values are assessed satisfactorily in case of loss by general average adjusters. (Q. 1861.) If there was indemnity values would be put up very largely at the commencement of the war, and this would lead to questions which do not exist now. (Q. 1863.) In these days of cables it would be known perfectly well in New York what the position was over here, and a very high value put on cargoes that were coming here that were likely to be in danger of being captured. (Q. 1870.) The ordinary underwriters might allow a shipowner to put a higher value than the Government would. (Q. 1894.)

SCHEME B.

This scheme would be very advantageous to an underwriter, because it would relieve him of all the bad risks. (Q. 1928.) It might just do for the critical period, and afterwards natural methods would assert themselves. (Q. 1930-1.) If the State fixed its schedule of rates in a clear form, it might be arranged that all the actual business of insurance could be carried on by underwriters acting on behalf of the State on commission. (Q. 1937.)

BOLTON, Mr. F., Underwriter, Broker, and Shipowner. (Qs. 2662-2970.)

I.

DESIRABILITY.

"I am of opinion that a scheme of national indemnity is desirable in the interests of the whole nation, but whether desirable or not, the Government in time of war would probably be forced sooner or later to provide some such protection." (Appx.)

DECLARATION OF PARIS.

"I pay no attention to that at all. . . . It would not be adhered to." (Qs. 2839-40.) A neutral cargo in a belligerent ship would certainly be captured and very likely condemned. (Q. 2897.) "We have had plenty of those cases of illegal captures." (Q. 2898.)

SHIPPING IN WAR TIME.

To induce the shipowner to put to sea in time of war, there would be the better freight market in the first instance, the high prices of commodities which would enable shipowners to demand higher freight, and lastly the charges to which a shipowner would be put if he laid his ship up. (Q. 2968.) But no manager could face his shareholders and report the loss of a ship uninsured which he had had the opportunity of keeping in safety. (Q. 2970.) One man to turn the engines and one watchman would be all the staff necessary to look after a ship in a home port. Depreciation is not a very important item. (Qs. 2965-7.) But laying up is an expensive operation away from home. (Q. 2963.) The effect of war would be to increase freights, and to raise the value of steamers. (Qs. 2958-9.)

MARKET FOR WAR INSURANCE.

If there were no national guarantee the losses of the first two weeks of war would probably be covered by the ordinary methods of the underwriting market. It is the later supplies that would be interfered with and stopped. (Q. 2845.) The market has not expanded in proportion to the increase of shipping since the great French war. (Q. 2769.) Once there had been losses a great many underwriters would simply refuse to touch war risks, irrespective of the locality. (Q. 2794.)

NEUTRALS IN WAR TIME.

Neutral ships plying to British ports would pay much the same war premiums as British ships plying to British ports. In any case, the premiums would be much more equal than they would have been before the experience of the Russo-Japanese war. (Qs. 2952, 2847.)

ATTITUDE OF OTHER INDUSTRIES.

The special reason for giving a guarantee to shipping is that its safety affects all interests. "If you cannot bring in your raw materials, you cannot keep your mills at work." It is true that underwriters and shipowners are benefited incidentally, but this cannot be helped. (Q. 2916.)

II.

NATIONAL INDEMNITY.

Does not vary the loss in any way. The actual loss to the community has got to be made good. State indemnity is only distribution. If you distribute the loss through the taxes you come back on to your units of the community. (Q. 2875.)

Advantages.—(1) Relief of the Government from unreasonable and undesirable pressure in time of war. (Appx.)

(2) Maintenance of prices at a more normal level. (Appx.)

(3) Continuity of supplies of foodstuffs and raw material. "I do not say at all you would obtain your normal supplies, but I do think that you would remove a hindrance to obtaining your supplies." (Q. 2757.)

(4) Better distribution of losses through destruction of property over the population as a whole. (Q. 2781-3.) Discrimination between luxuries and necessities would cause a complication which might destroy the value of the scheme. (Q. 2786.)

(5) Continued employment of our Mercantile Marine. Unless shipowners had protection in some form or other the losses, according to the Report of the Admiralty Manœuvres, 1906, would be so heavy that no owner would venture to go to sea. It would be impossible for him to get his insurance effected. (Q. 2760.)

(6) Prevention of discrimination against the British flag in favour of neutrals. Without indemnity an insurance under the British flag would be heavier than under a neutral flag. (Q. 2798.) In time of war foreign shipping employed in our own trade would be released for the neutral trade. (Q. 2800.) "There is an enormous mass of our trade under our flag from neutral port to neutral port; it is there that the heaviest weight of the discrimination would fall." (Q. 2802.)

(7) Temptation to transfer would be removed. "Although I do not attach in any case much importance to this point, it is as well that the temptation should not be present." (Appx.)

Cost.—The weekly amount of British shipping at risk is £27,834,000. (Q. 2818), of which, it is assumed, 50 per cent. would have to traverse the danger zones. (Appx.) The report of the Naval Manœuvres gives an indication that the enemy would capture about one-third. (Q. 2811.) Allowing for two weeks at full rate of capture, estimated at 25 per cent. for the trade to and from the United Kingdom, within the danger zones, this would mean £6,958,000. (Appx.) To which must be added £2,000,000 for foreign trade in British vessels, and £1,500,000 for British steamers and their cargoes in foreign ports. (Appx.) Making altogether £10,500,000, as the result of two full weeks of the maximum rate of capture, before complete mastery of the sea is gained. (Qs. 2921-3.) This argument, which is based on the manœuvres, involves the assumption that the enemy would be able to act in as great strength relatively to our fleet as our Blue fleet. (Q. 2866.) It is also made on the assumption that neutral cargoes taken would be a total loss, whereas if we were the victors we could probably enforce recovery. (Q. 2681.) There would be no objection to charging either registration fees or stamps on bills of lading, or tonnage dues, or even in the last resort a small tax so as to build up a fund out of which these sums for indemnity should be paid, though "I have not considered" a scheme of this kind. (Q. 2949.)

Fraud.—Even though additional insurance would have to be allowed to cover values that were dependent

on the immediate circumstances, fraud is not to be feared. (Qs. 2721-2.) Business is too much done in the open nowadays; men have their reputations and their characters to lose. (Q. 2729.)

Ownership.—"If you guarantee the flag, cargo will not be transferred to British ownership." (Q. 2676.) If foreign owned cargo in British bottoms were not indemnified, a great blow would be dealt at our shipping trade. (Q. 2679.)

Bounty.—No doubt by the scheme of indemnity you do benefit shipowners and cargo-owners, but you cannot help it. You do not do it for that purpose; that is incidental." (Q. 2835.)

SCHEME B.

The State would only get the risks where the market valuation of the risks was in excess of the premiums demanded by the State. (Q. 2874.) "I do not think it is an equitable distribution of loss, and I think the mechanism of the working of it would be very difficult," though "it would be perfectly mechanical if you had certain zones at certain prices." (Qs. 2881, 2883.)

III.

CONDITIONS OF INDEMNITY.

To secure the full benefits of national indemnity it is necessary that a scheme should provide

(1) The least possible dislocation in and disturbance of commerce and industry.

(2) As complete protection as that afforded by the organisation which it replaces.

(3) A method simple in form and free from complication.

(4) A Board of Administration possessing unfettered control, and commanding confidence both in the ability of its management and in prompt settlement of claims. (Appx.)

SUGGESTED ALTERATIONS TO SCHEME A WITH A VIEW TO MAKING IT COMPLY MORE NEARLY WITH THE ABOVE CONDITIONS.
